OUR GREETING FOR 1889.

In compliance with the repeated and widely-expressed wishes of our patrons, both subscribers and advertisers, the AMERICAN ANALYST will hereafter be published each week instead of twice a month. This change is not a suggestion of recent occurrence, but its expediency and importance have been pressed upon our observation with growing force for a long while, and the step has been for several months under consideration. It was thought best, however, to conclude the volume, just finished, under the old system, and to enter upon the new one with the beginning of the year. Apart from more than doubling our yearly issues—and consequent expenses—and the introduction at appropriate times of new features of interest, there will be no change in the scope and character of the journal. The subscription price also will remain as heretofore, One Dollar a year, making the AMERICAN ANALYST the cheapest publication of its character in the United States. Our readers and our advertisers, alike, will

derive benefit from our more frequent grasp upon the public attention; and we hope, in turn, to deserve and attract the increased approval of the home-loving public, in whose particular behalf our service is given.

With which brief words of greeting we wish our many patrons from California to Maine, from Canada to Louisiana, and from Europe to distant Australia, all the blessings and good gifts attendant upon

A HAPPY NEW YEAR.

THE GOVERNMENT AND PURE FOOD.

At the last session of Congress an act was passed, which the President approved in October, making the Commissioner of Internal Revenue responsible for the prevention of food adulteration in the District of Columbia. Regarding this law as a step in the direction of general pure food legislation, the Commissioner caused a compilation to be made of the laws of other countries, and an investigation of food adulterations and the means of their prevention. This task was intrusted to Prof. Richards, Government chemist and microscopist, of whose report an abstract has been given to the public, containing a number of interesting features. The position maintained for several years by the AMERICAN ANALYST, that the general prevalence of harmful food adulteration is largely a fiction, attributable to sensational newspaper writers, and notoriety-seeking charlatans of other guilds, is emphatically indorsed in this official report. Thanks to the wide-awake solicitude of our Boards of Health, city and State, and to the inflexible exposures of frauds by the press, which this journal initiated and has consistently maintained, the adulteration fiend is steadily finding his sphere of operations become more and more circumscribed and precarious. We quote below a portion of Prof. Richards' report, one passage in which, relating to the wholesome character of oleomargarine, whose manufacture in this country is now so unjustly restricted by unfair legislation, we desire to call to our readers' special attention:

A list of the most common adulterants met with in the principal food products, compiled from the reports of the State Boards of Health, the returns of the English Inland Revenue Department, and the report of the Municipal Laboratory of Paris, shows that the great majority of substances used for adulterants are not injurious to health; the public is *cheated*, but not *poisoned*. They consist for the most part in the willful and fraudulent addition of substances which do not exist in the normal product or are only found there in the abnormal product, or only in an appreciably lower proportion. The number of substances used that are positively injurious to health is small, and they generally make their presence felt by the prompt manner in which dangerous symptoms manifest themselves in the consumer. Such are the arsenic, copper, lead and other metallic poisonous salts that are sometimes used for artificial colors in candies, pickles, etc. It seems to be a popular impression that any substance used as an adulterant of, or a substitute for, a food product is to be avoided as itself being injurious to health. Such impression is erroneous in nearly every

case. Oleomargarine, for instance, is a mixture of milk, cream, butter, suet fat, lard, cotton-seed oil in the lower grades and salt, with a very small proportion of the coloring matter, annatto, used by farmers to produce the rich golden tint. The greatest cleanliness is observed throughout its manufacture, and the finished products, as well as all its ingredients, are perfectly pure and wholesome articles of food. Food adulteration is carried on by manufacturers in the interest of pecuniary profit and gain, and they take pains to keep themselves well posted on the subject of cheap and harmless substitutes. This is well illustrated in the most recent form of milk adulteration. Any general law on food adulteration should clearly define the terms "adulteration," "alteration," "imitation" and "substitution." It should also consider the use of antiseptics, of harmful coloring matters, and of the products of diseased animals. A clear and concise definition of the different food products, as well as an accurate statement of what shall be the minimum composition of the principal ingredients of the chief food products, would also be very desirable.

THE RESULT OF STUPID LEGISLATION.

Not long ago the dairy interest in this country succeeded in having laws passed to check the manufacture and sale of oleomargarine, and, while in some States it was absolutely prohibited, in all the sale of this really good and wholesome butter substitute was interfered with to such an extent that the consumer has been compelled to purchase butter which is infinitely poorer than oleomargarine, at outrageous prices. This achievement was damaging enough, but a more serious damage has resulted. England, seeing the precautions Americans were taking, and very naturally judging that as oleomargarine was an essentially American product we should know all about it, passed similar restrictive laws, and now the English market is almost closed against an important American export. It is true that there are comparatively few engaged at present in the manufacture of oleomargarine, yet it is equally true that an extensive industry cannot be injured without doing equal injury to collateral industries. This English imitation of our suicidal oleomargarine legislation has already borne fruit in cutting down the prices farmers and cattle breeders receive for their cattle. In this connection it may be pertinent to ask how long it will be before England will notice the tendency here to hamper and restrain the dressed beef industry, and by following that pernicious example seriously check our export trade with herself, and thus drive another nail in the coffin of our cattle interests?

A PERSECUTING PROSECUTOR.

Laws for the restriction of the traffic in alcoholic liquor are presumably adopted in the interest of the public, and not for the benefit of any particular class of individuals. A crafty Kansas lawyer, however, seems to have been construing the liquor law of that State as an instrument for his own pecuniary advancement, irrespective of the public welfare. Under the heading, "Arrested for Big Costs," the daily papers of Decem-

ber 9 announced the re-arrest and imprisonment for costs, amounting to \$5,277, of Mr. Stewart, a Wichita (Kan.) drug clerk, who about a year ago was fined \$20,000 and sentenced to seventeen years in jail for selling a few glasses of beer. After six months in jail Stewart was pardoned by the Governor, but the Assistant Attorney-General, after an unsuccessful attempt to collect costs from the building in which the liquor was sold, demands now that Stewart shall be incarcerated until the costs, amounting to \$5,277, shall have been paid. Of this amount, \$5,200 go to the prosecuting attorney, leaving but \$77 for the county. "This," says the *National Druggist*, with truthful emphasis, "is simply outrageous, and is an apt illustration of the charges made by our Kansas City correspondent, some months ago, that the enforcement of the Kansas liquor law was simply a question of fees to the prosecuting attorneys. It is, however, exactly the way to bring the whole system into such disrepute that the people will be compelled to abolish it. The sooner the better for decency and humanity.

THAT SOCIETY AGAIN.

The famous American Society for the Prevention of Adulteration of Food, whose membership is made up of thirty-five retail grocers and some shining lights of the Philadelphia bar, threatens to hold its annual convention this month in Washington. As none but the actual members are to be invited, there will probably be some funny proceedings, but happily no public damage can ensue. The yearly demonstrations of these retail agitators remind us of the flies on the revolving wheel exulting over the dust they are raising. They hold themselves in high esteem. When they have finished their palaver, however, they go complacently home again, and the world resumes its accustomed diurnal rotations.

BURNETT'S

PERFECTLY
PURE
Standard Flavoring
HIGHLY
CONCENTRATED
EXTRACTS

THE superiority of these Extracts consists in their **PERFECT PURITY AND GREAT STRENGTH.**

There is no subject which should more engross attention than the purity of the preparations which are used in flavoring the various compounds prepared for the human stomach.

They are not only true to their names, but are prepared from fruits of the best quality, and so highly concentrated that a small quantity only need be used.

JOSEPH BURNETT & CO., Boston, Mass.

INSENSIBLE SENSATIONS.

QUESTIONS OF EXISTENCE WHOSE SOLUTION IS DEFERRED.

The following conjectures on "sensations not known," taken from the *Popular Science Monthly*, are interesting in the suggestions they offer of a vast domain of sight and sound, ever with us and surrounding us, but outside the present reach of human recognition:

Sound is the sensation produced on us when the vibrations of the air strike on the drum of our ear. When they are few, the sound is deep; as they increase in number, it becomes shriller and shriller; but when they reach 40,000 in a second they cease to be audible. Light is the effect produced on us when waves of light strike on the eye. When four hundred millions of millions of vibrations of ether strike the retina in a second, they produce red, and as the number increases the color passes into orange, then yellow, then green, blue and violet. But between 40,000 vibrations in a second and four hundred millions of millions we have no organ of sense capable of receiving the impression. Yet between these limits any number of sensations may exist. We have five senses, and sometimes fancy that no others are possible. But it is obvious that we cannot measure the infinite by our own narrow limitations. Moreover, looking at the question from the other side, we find in animals complex organs of sense, richly supplied with nerves, but the function of which we are as yet powerless to explain. There may be fifty other senses as different from ours as sound is from sight; and even within the boundaries of our own senses there may be endless sounds which we cannot hear, and colors as different as red from green, of which we have no conception. These and a thousand other questions remain for solution. The familiar world which surrounds us may be a totally different place to other animals. To them it may be full of music which we cannot hear, of colors which we cannot see, of sensations which we cannot conceive.

A LARGE PERCENTAGE.—In London, in 1886, there was one doctor to every 939 persons.

STEVENSVILLE MILLS.

IMPEROYAL VACUUM COOKED OATS. IMPEROYAL VACUUM COOKED WHEAT.

BREAD.

THE CHEMISTRY INVOLVED IN THE FAMILIAR PROCESS OF MAKING IT.

The transformation of the flour, obtained by grinding wheat, into a soft, spongy, nutritious mass known as bread, although a matter of everyday occurrence, is dependent upon some very peculiar and important chemical changes. If flour is mixed with water to form a dough, and dried at the temperature of the air, an unpleasant-tasting mass is obtained, which contains the starch of the flour in an unaltered and insoluble state, and very difficult of digestion; and to obtain a nutritious and palatable bread, it is necessary to induce certain chemical and physical changes in the flour. Wheat flour is principally composed of starch, and contains, on an average, about sixty-three per cent. of that substance, with fifteen per cent. of water. The remainder is made up of small amounts of sugar, fat, casein, and a mixture of various gummy bodies, generally known as gluten. This gluten is an important part of the flour, giving it consistency and flavor, and also rendering it more nutritious. By kneading flour under a gentle stream of water, the starch can be washed away and the gluten separated. The action of the heat in baking causes certain changes to take place in the starch, by which it is rendered soluble, and to some extent converted into another substance resembling gum, and known as dextrine. The outside of the loaf is altered to a greater extent, forming the crust. These changes have the effect of rendering the bread both nutritious and palatable; but to prevent its becoming a heavy, solid mass of dried dough, it must be "raised," or inflated with gas, so as to convert it into a light, spongy substance which can be easily masticated and digested. The gas used for this purpose is always carbonic dioxide, and the best method to develop it in the mass of dough is to set up a vinous or alcoholic fermentation by the addition of yeast. This substance is a most remarkable living organism, which, when introduced into the dough, begins to feed upon the starch, which it changes into alcohol and carbonic acid gas. Owing to the tenacious nature of the dough, the gas cannot escape, but, as it expands, renders it spongy and light. The heat of the baking oven still further expands the gas, and completes the process, at the same time killing the yeast, and preventing further fermentation. If the fermentation continues too long, it passes over into the acetic variety, the alcohol is changed to vinegar, and the bread "sours." The alcohol produced in the process is nearly all dissipated in the baking; but it is an appreciable quantity, and some years ago a company was formed in England to introduce appliances for condensing and saving it. The method was found impracticable, but it created considerable excitement, and

one baker advertised to sell his bread "with all the gin in it." When baking powder is used as a leavening agent, carbonic acid gas is formed in the dough as with yeast, only it is set free by the reaction of certain chemicals upon each other, forming salts which remain in the bread, and none of the constituents of the flour are decomposed. A process has also been tried of kneading the dough in closed vessels with water containing carbonic acid gas in solution under pressure, like soda water, the supposition being that when the pressure was removed the gas would expand and cause the dough to rise. This aerated bread, as it was called, has been made both in this country and England, but the method has not been successful, and it is not now in use. It is interesting to note that the style of oven and method of bread baking in use in Europe at present has undergone little or no change since the earliest times. The old-fashioned brick oven is still used, and the fire built inside until the necessary heat is obtained, when it is raked out and the loaves put in its place. Although the method is a clumsy and wasteful one, it must be confessed that the bread produced by the French and German, and especially the Viennese, bakers is unexceptionable in quality. Probably the care used in mixing and kneading has as much to do with the result as the baking itself. Bread is not often adulterated, but the deficiencies of a poor flour are sometimes covered up by the addition of alum or a minute quantity of sulphate of copper (blue vitriol). These substances render the bread whiter and of a better consistency, but are not only a fraud upon the purse of the consumer, but detrimental to his health as well. Most of the cheaper varieties of baking powder contain alum, and their use cannot be recommended. The art of bread making has been known from the earliest times, and as early as the period of the Jewish exodus the process of leavening was in general use. In the museum at Naples there are exhibited loaves of bread taken from a shop at Pompeii and stamped with the name of the baker. They are perfect in shape, but are quite black, probably from the heat of the volcanic ashes which were cast upon the city from Vesuvius. When properly made, bread is a most wholesome and nutritious food, and, with the other cereal products, forms the principal means of sustenance of a large majority of the human race.—*Pop. Science News.*

CARVING.

SOME SUGGESTIONS FOR THE HEAD OF THE FAMILY.

But in a club, says Ude, nothing is so prejudicial as bad carving. A joint ill carved at first by one, is always disregarded by the other members; and, frequently, from this circumstance, a joint of great weight and price is no longer presentable, and is left, to the loss of the establishment. In serving soup, one ladleful to each plate is sufficient. A steel knife applied to fish is likely to spoil the delicacy of its flavor, so that it should be helped with a silver slice or trowel, and be eaten with a silver knife and fork. Do not pour sauce over meat or vegetables, but a little on one side. In helping at table, never employ a knife where you can use a spoon.

The fairest mode of cutting a ham, so as to eat fat and lean evenly, is to begin at a hole in the centre of the thickest part, and cut from it thin circular slices; by this means also the moisture and flavor of the ham are best preserved.

The upper part of a roast sirloin of beef should be carved at the end, and never cut in the middle, unless you wish to destroy the joint in revenge.

Be careful always to cut down straight to the bone, by which method you never spoil the joint, and help many persons with little meat; what remains looks well, and is good to eat.

In carving a leg of mutton, slice it *lightly*, else if you press too heavily the knife will not cut, you will

squeeze out all the gravy, and serve your guests with dry meat.

Ude considers a saddle of mutton is usually carved contrary to taste and judgment. "To have the meat in the grain, pass your knife straight to one side of the chine, as close as possible to the bone; then turn the knife straight from you, and cut the first slice out, and cut slices lean and fat. By disengaging the slices from the bone in this manner, it will have a better appearance, and you will be able to assist more guests."

If you begin to carve a joint in the middle, the gravy will run out on both sides, and the meat shrink and become dry, and be no more presentable.

Never pour gravy over white meat, as the latter should retain its color.

Of roasted fowl, the breast is the best part; in boiled fowl, the leg is preferable.

The shoulder of a rabbit is very delicate; and the brain is a tit-bit for a lady.

In helping roast pheasant or fowl, add some of the cresses with which it is garnished.

The most elegant mode of helping hare is in filets, so as not to give a bone, which would be a breach of good manners.

Before cutting up a wild duck, slice the breast, and pour over the gashes a few spoonfuls of sauce, composed of port wine or claret (warmed), lemon juice, salt and cayenne pepper.

The most delicate parts of a calf's head are the bits under the ears, next the eyes, and the side next the cheek.

If cray-fish be added to a fricasseed chicken (as in France), one of the fish should be placed on the top, in dishing, and served to the first guest.

IMPURE WATER.

SOME SIMPLE TESTS FOR ITS DETECTION.

The growing popular knowledge of invisible impurities, and the deepening impression upon the minds of people, the necessity of a pure water supply, have caused a demand for a simple and convenient test. As yet there is no certain and reliable test by chemical analysis. The following tests are recommended by the *Engineering and Building Record*: "Fill a perfectly clean quart bottle half full of water, cork and shake it; remove the cork and see if any odor can be detected at the mouth of the bottle. Cork the bottle again and put into a warm place for a few hours, or set into a pan of hot water for an hour. Shake, uncork, and again test by smell. If an unpleasant or faint, or musty odor is perceptible, the water requires more minute investigation. The second simple test is to evaporate a quart of water to dryness in a new tin pan or cup, and note the character of the residue, and what happens when it is strongly heated in a metal spoon. If the sediment left after evaporation is small, and on being burnt in a metal spoon gives rise only to such an odor as comes from burning vegetable matter, the water is not greatly contaminated with sewage. But if the sediment is in considerable quantity, dark in color, and burns, giving off the peculiar odor of burning hair or other animal matter, then the water is foul."

PROGRESS BACKWARD.—The Board of Directors of the Western Pennsylvania Medical College have refused to admit female students. Six young ladies applied for admission.

QUALITIES OF WOOD.—According to Professor Sargent, the strongest wood in the United States is that of the nutmeg hickory of the Arkansas region, and the weakest is the West Indian birch. The most elastic is the tamarack, the white or shellbark hickory standing far below it. The least elastic and the lowest in specific gravity is the wood of the *Ficus aurea*. The highest specific gravity upon which in general depends value as fuel, is attained by the bluewood of Texas.

A. J. 1894

BANANAS AND PLANTAINS.

THEIR NATURE, CULTURE AND ECONOMIC VALUE.

The banana is much softer and more delicately flavored than the plantain. The fruit when ripe contains 74 per cent. of water; of the twenty-six remaining parts, twenty are sugar and two gluten or flesh-forming substance. Like rice, it is not by itself a perfect food, but requiring the addition of some more nitrogenous material, as pulse or lean meat. When dried and converted into meal, it is less nutritious than the meal of the grain mentioned. In tropical countries it is, nevertheless, a most valuable food, and is so extensively consumed as to take the place of our cereal grains as the ordinary article of diet. About six and a half pounds of the fruit, or two pounds of the dry meal, with one-quarter pound of salt meat or fish, form in tropical America the daily allowance for a laborer. The pulp of the plantain is squeezed through a fine sieve and formed into loaves, which, when dried, will keep a long time. The unripe fruit often becomes the staff of life; it is dried in the oven and is eaten in this state, and will keep such a length of time that natives carry it with them when proceeding on journeys. While unripe the fruit is filled with starch, and when dried has a resemblance to bread both in taste and composition. The loaves made by the ripened pulp are saccharine and not farinaceous. There are many instances of men subsisting entirely upon bananas, who have been deserters from ships in tropical climes. Mr. Stanley, in his book, "Across the Dark Continent," frequently mentions bananas as one of the principal articles of food for his party, and as one of the most important crops of the natives. He states that "villages and banana fields were always found together." Also, that in the dwarf lands bananas as long as his arm and plantains as long as the dwarfs (just one yard) were sufficient food for a man one day. He says, besides, that he was "compelled for weeks to subsist on green bananas, cassava and sugarless tea," and a scant supply at that. At a place on the Congo he purchased "ten bananas, thirteen inches in length by three inches in diameter."

In British Guiana and other tropical countries bananas are largely used as the food of infants, children and invalids. They are of higher alimentary value than such preparations as sago or arrow-root, because containing a larger proportion of starch and a certain percentage of nitrogenous matter.

The name of the plantain is derived from the Spanish name plantano, by which this plant is known in foreign countries, the name banana never being used. It forms a spurious kind of stem five to thirty-five feet in height, by the sheathing bases of its leaves—those on the largest varieties measuring over ten feet long and two feet wide. The stem sends out these large ends from the centre of the top until it arrives at maturity, when a smaller leaf appears, which indicates that it will fruit. The fruit stem then sends out a large purple bud shaped like an ear of corn in its husk. The fruit grows on this stem in "hands" containing from eight to fourteen bananas, and there are about eight to ten of these hands constituting the "bunch," which often weighs one hundred pounds and averages forty pounds. These hands are somewhat spirally placed on the stem. The evolution of the banana on the stem is peculiar and very interesting. First comes the large purple bud or cone already mentioned. This is about twelve inches long and three inches in diameter, having a number of leaves. Secondly, under the first leaf on this cone in due time come from eight to fourteen blossoms. Thirdly, these blossoms in their turn after awhile grow little bananas at their bases in the same way as apples with us grow from their blossoms. Finally, when these bananas have grown about two inches long, the leaf that covers them dries and rolls up and then falls off, and the first "hand" of bananas is revealed, looking quite cute and curious. The second and succeeding

hands are formed in the same way, but meanwhile the cone keeps growing in length and the stem in thickness, thus giving space between the "hands" for the fruit when fully grown, and strength to the stem to sustain the great weight of the completed bunch. The fruit of a single tree averages from thirty to forty pounds, and often seventy or one hundred pounds.

The banana tree bears but one bunch of fruit before it dies down, when from two to ten trees spring up around it. The banana is eaten in many ways, but principally raw when ripe. A certain coarse banana, which is not agreeable to eat raw, is peeled, sliced and fried in hot lard, and is a delicious vegetable for the table. Those who purchase green bananas by the bunch to ripen in the store closet will find this an excellent and acceptable way to cook some of them. The fibre of the banana tree is worth more than its fruit, which cost but fifteen cents a bunch in its native clime; but this fibre in many countries is permitted to go to waste. In Central America this fibre, with only the preparation of drying, is made into shoe strings and cords for all uses. It is divided into threads of silken fineness extending the length of the body of the tree, which shoots up from ten to fifteen feet without a branch. Within the last three years the imports of bananas at the port of New York alone has doubled. Three million bunches are brought here annually, and nearly all of them in steamships loaded only with this fruit. Formerly they were brought here in "fruiters," or fast sailing ships. About one-half of the imports come from the port of Baracoa, Cuba, but the island of Jamaica is increasing her exports of this fruit so rapidly that now they amount to \$200,000 more than what is realized on sugar. In August of this present year there were ten steamships loaded in one week with 120,000 bunches, valued at \$60,000, for northern ports of this country. It is estimated that the increased receipts of bananas per year is 40 per cent. Formerly New York was the only port at which the banana was received, but since the trade has increased so extensively Boston, Philadelphia and Baltimore are now importing the fruit. The yellow banana importations are 40 per cent. more than those of the red species. The sale of the red banana is confined to New York, the Eastern States and some portions of Canada. The yellow fruit is preferred on account of its superior flavor, and because it is more profitable to handle. In a bunch of yellow fruit there are just about twice as many bananas as in a bunch of the red variety. The opinions of physicians in regard to bananas as food for the sick have altered in about the same degree as their ideas concerning milk. At one time the latter was supposed to be "feverish," and was denied a typhoid patient. Now it is their chief subsistence. Bananas served cold from the ice are very acceptable to the sick, and are now allowed by most of the medical faculty.—*Journal of Health*.

SANITARY TRUTHS.

SOME OF THE USEFUL WORK DONE BY STATE BOARDS OF HEALTH.

With all the progress that sanitary science has made and is making, some very mischievous notions seem to remain as fixtures in the popular mind, despite the utmost efforts to eradicate them. The series of sanitary conferences or conventions which have become features of the work of the Ohio and Michigan State Boards of Health, are doing much to eradicate these errors and educate the public in line with the advances being made by the scientists. President Avery, of the Michigan board, in his opening address at Hastings, lately, called attention in a rather striking way to one of the common mistakes of the public. He said that if it were to be announced that a case of smallpox was in the room, but few of the audience would be there two minutes later; but if it were known that a sufferer from

diphtheria was in attendance, few, if any, of those present would think it necessary to leave with any haste. Yet diphtheria was just as infectious and much the more deadly disease of the two. Only those contagions were dreaded that had made reputations for themselves, as it were, no attention being paid to the instances of deadly infection occurring daily and on every hand. A disease has to come from a distance and be heralded as a sensation before people will realize its danger. Another instance of insalutary conditions in the midst of supposedly healthy surroundings was quoted at the same session. Professor Victor C. Vaughan referred to frequent cases among farmers in the State where the indications of insufficient oxidation of the blood existed, in spite of the daily outdoor exercise of the patients. The absorption of oxygen in the daytime was more than offset by the lack of ventilation of the farmers' sleeping apartments, where they spent nearly a third of their lives in a vitiated atmosphere, the conditions being frequently such that the oxygen would be used up by the sleeper in the first hour of retirement, the rest of the time being spent in an atmosphere unfit for human respiration. These are two of the most frequent paradoxical proceedings in which the lives and health of the people are sacrificed without the slightest suspicion existing in the minds of the sufferers that they are violating the simplest of the laws, the observance of which is essential to the enjoyment of life for its natural span. The continuance of the policy of the two State boards mentioned, and the adoption of similar means of reaching the popular ear, will, in time, educate the people in at least the essentials of sanitary living, without expecting them to follow every development of science.—*Sanitary News*.

THAT MOVEMENT.

HOW THEY ACCOUNT FOR ITS INTERRUPTION IN ALBANY.

Commenting upon our recent inquiry—propounded in all good faith—as to what had become of the retail grocers' alleged "pure food" movement, our spicy contemporary, the *Merchants' Mail*, of Albany, says:

Our esteemed contemporary will remember what a howl was set up at the Washington convention. A retailer must be set up for president. In the face of that howl we had the courage to nominate for that office a man who was not a retailer. We intended no disrespect to the retailer in so doing. We felt that the retailer who had been nominated did not possess the ability of engineering to a successful ending such a great undertaking. Time has proved that we were right, and one of the chief reasons why the pure food movement is today the laughing stock of the country is because, as we believe, the incompetency of its president. Had a man been selected for that position who had some magnetism about him—a man who possessed to an unusual degree the characteristics of energy and push—to-day would have seen a different result. When the association sees fit to place at its head men who are known outside of a radius of fifty miles—men that have a national reputation—there may then be some prospect for it.

COST OF LIVING.—The average cost of living for all nations is about 29½ cents daily per inhabitant, that is, 40 cents for a man, 32 cents for a woman and 16 cents for a child.

VALUE OF TIMBER.—Timber constitutes a great industry and represents an annual expenditure of \$1,365,000,000. Its consumption throughout the world has increased 50 per cent. since 1850.

TO REMOVE TATTOO MARKS.—M. Variot gives a method of getting rid of tattoo marks which causes but little pain and leaves no deformity. He simply punctures the skin over the mark with fine needles and introduces a little tannin, and then touches the parts with a strong solution of nitrate of silver. This forms a tannate of silver scab that falls off soon, and the mark goes away with it.

DOMESTIC DIETETICS.

SPECIALLY PREPARED, FROM PRACTICAL TESTS, FOR THE
LADY READERS OF THE "AMERICAN ANALYST."

SEASONABLE FOOD.

January.

MEATS.—Beef, mutton, ham, kidneys, liver, venison, sausage, pork.

GAME AND POULTRY.—Grouse, hare, pigeon, quail, chicken, duck, turkey, rabbit, goose.

FISH.—Bream, cod, crabs, eels, carp, flounder, halibut, herring, lobster, mackerel, mussels, oysters, perch, pike, rock-fish, salmon, smelt, whitefish.

VEGETABLES.—Artichokes, beets, beans, cabbage, carrots, cauliflower, celery, garlic, lettuce, onions, parsley, parsnips, potatoes, shallots, spinach, squash, tomatoes, turnips.

FRUIT.—Apples, bananas, grapes, oranges.

PRACTICAL RECIPES.

CARROT SOUP.—Six fine large carrots, two quarts rich stock; cut the carrots, after thoroughly scraping, into thin slices; stew them in the stock until they are tender through, then force them through a sieve or tanning with a wooden spoon, until a red pulp is deposited; re-boil it with stock until thick and rich; season and serve.

DUCK PIE.—Cut off the neck and wings of the duck; put them in a stew-pan with the giblets, a sliced onion, a lump of butter, a bunch of herbs, a bit of mace, cayenne and black pepper and salt. Stew for a few moments till the butter is dissolved; add a cup of boiling water and stew gently for an hour; take from the fire and cool. Take the duck and put it to boil for about a quarter of an hour. Cut it up and arrange neatly in the pie dish, adding what seasoning is required. Skim the fat from the gravy and pour over the duck. Cover with pie crust and bake for one hour.

CURRIED OYSTERS.—To the liquor from one quart of oysters add one-half cupful of butter, two tablespoonfuls of flour and one of curry powder. Put in a saucepan and let boil; add oysters and a little salt; boil up once and serve.

BREAD DICE FOR SOUP.—Cut slices of stale bread in small squares, throw in boiling lard and fry till brown. Skim out, drain, and put in soup tureen before serving the soup. For oyster soup, crackers crisped in the oven are nice.

WHITE AND YELLOW MOUNTAIN CAKE.—Two cupfuls sugar, three-quarter cup butter, whites of seven eggs well beaten, two-thirds cup of sweet milk, two cupfuls flower, one of corn starch, two teaspoonfuls of Horsford's baking powder; bake in jelly cake tins. Frosting.—Whites of three eggs and some sugar beaten together, not quite as stiff as for frosting; spread over the cake; add some grated cocoanut; then put your cakes together; put cocoanut or frosting for the top.

CREAM POTATOES.—The mistake usually made in preparing this excellent dish is that many economical housewives use cold boiled potatoes left from the preceding day. True economy would have been in boiling just enough for each meal; but for potatoes with cream, see to it that they are boiled and afterwards cut up while warm, and seasoned with salt and pepper. Boil half a pint of cream, add to it a walnut of butter, and add the potatoes to it. If milk is used, it may be thickened a little with flour.

PUMPKIN PIES.—Take a small pumpkin, or half of a large one; stew long and slowly; then strain it, after peeling and cutting it in small pieces. Mix with this

quantity of pulp one quart of sweet milk, three eggs, and two tablespoonfuls of corn starch mixed; first smooth with a little of the milk. Salt, sugar and ginger must be put in to taste. A large cup of sugar is about right; one nutmeg. The ginger is indispensable to a genuine pumpkin pie. If part cream can be used, the pie is much richer, as well as more delicate in flavor. Bake with an under crust only.

SCOTCH BARLEY BROTH.—Four pints of soft water, two ounces pearl barley, one pound salt beef, one marrowbone, six shank bones broken into small pieces, two large onions, one stick of celery, two turnips, and two carrots thinly sliced. Set the saucepan containing these ingredients over a clear fire; when it boils, skim it, and let it simmer slowly for five hours. Twenty minutes before serving, add a teacupful of chopped parsley and some salt.

TO USE UP COLD MEAT.—Prepare your meat as for hash; line deep dish with boiled macaroni; on top of that place the hash; cover it with tomatoes, over which sprinkle bread crumbs, with a little butter; bake until nicely browned.

A LIGHT CAKE.—Take a pint bowlful and a half of sugar, one and a half cups of butter rubbed in two pint bowls of flour, two cups of sour cream, a teaspoonful of saleratus, tablespoonful of rose water, four eggs well beaten, and a little nutmeg.

OATMEAL CAKES.—One cup oatmeal, wet with one cup sweet milk; soak over-night; in the morning add a little salt, one teaspoonful Horsford's baking powder, one egg, and enough sweet milk and a little cream to make as other gems; bake in gem-pans in a quick oven.

THE EARTH A SEPULCHRE.—The whole earth is the sepulchre of great men; not only are they commemorated by columns and inscriptions in their own country, but in foreign lands there dwells also an unwritten memorial to them, graven not on stone, but in the hearts of men.

A GLASS EATER BROKEN.—Harrison, the glass-eater of the dime museum, is in the Bellevue Hospital, New York, suffering from gastritis. The goblets and lamp chimneys he used to chew were made for the purpose of isinglass and silicate, but a regular diet of this material has produced severe gastric irritation.

A BIG SCHEME.—There is a scheme on foot for a railroad around the world. It is to run from the United States along the Pacific shore to Behring's Straits, and connect with the Russian railroad from Siberia to St. Petersburg. Engineers who have been looking up the matter say that the scheme is a feasible one, and that it will be accomplished within the next ten years. The Behring Straits are only thirty miles wide, and so dotted with islands that bridging can be made possible. This is rather a big scheme, but one ought never to be surprised at anything in this age.

AN ANCIENT TOAD.—Local antiquarians and zoologists are enchanted at present with a live toad found in the course of railway excavations at Greenock, Scotland. The toad is from 20,000 to 30,000 years old, as the stratum of clay in which it was found certainly dates from the glacial period. Its mouth is sealed up. It breathes slightly through the nostrils, and though the eyes are quite expressive, it does not seem to see.

DANGERS OF CHEWING GUM.—An interesting interview took place recently between a Philadelphia optician and an editor on the Philadelphia Record in regard to the injuriousness of the gum-chewing habit. He said: "I would advise the girls to stop it at once, 'swear off,' as the drinkers say, for in one respect these dainty girls are like drunkards. If they are chronic gum chewers, they are heir to all the infirmities that afflict the chronic whiskey drinkers. The greatest injury is caused to the eyes. The muscles of the jaws connect with the spine, and from the spine there are fibrous tissues running in all directions; a number of these extending to the eyes are called the optic nerves. These nerves are very sensitive, and when over-worked become shrunken and feeble, and the process of deterioration to the eyesight begins. The vision soon becomes impaired, and eye-glasses must be resorted to."

WHAT IS SARSAPARILLA?

A question that is often asked but seldom answered is, What is sarsaparilla? So many preparations are in the market bearing that name that the question is more than justifiable. The answer is simple enough. Sarsaparilla is the Toltec name for a shrub which grows anywhere from the Rio Grande, on the border of the United States, to the centre of Chili, and which possesses remarkable medicinal and blood-purifying qualities, finding its highest development in Honduras, Central America. When the Spanish *conquistadores*, under Hernando Cortez, landed in Yucatan, to start upon their world-famous subjugation of Montezuma and his Mexican civilization, the first foe that they encountered was the malarial fever, for which Central America now is, and long has been, renowned. The drugs and medicaments of Europe proved worse than powerless, doing more harm than good. The troops sickened and died; nothing seemed left to the bold and reckless adventurers of the Old World save an early and painful death in the New. It was in this condition of affairs that Lieutenant Alvarez called upon the native physicians, and from them received a tea, made by long boiling a mass of Honduras sarsaparilla and straining the resulting thick fluid. Chemistry was then in its infancy, and neither Aztec, Toltec nor European had the faintest conception of the intrinsic value of vegetable extracts, but charged everything to either the skill of the physician or the magical nature of herbs in general. The miraculous success of the sarsaparilla tea attracted the attention of the Spanish monks who accompanied or followed Cortez's quest, and induced them to make a series of investigations, to which every human being is to-day indebted. They found that an extract of sarsaparilla varied according to the age and the freshness of the shrubs used, and that while a young and fresh shrub gave the best possible results an old and decayed one was practically inoperative and worthless. Their researches were extremely interesting. They ascertained that severe cases of blood disease, inflammatory rheumatism, gout and neuralgia had been cured by the use of strong sarsaparilla tea. They learned that the shrub was even venerated as an object of religious adoration. Their reports were duly transmitted to the great monasteries of Europe, and sarsaparilla, especially Honduras sarsaparilla, sprang forth into the *materia medica* of Christian civilization. Here it has ever since remained, and here to-day it occupies the unique position of being the greatest blood purifier with which the medical faculty is acquainted.

Chemistry has made vast strides in the past fifty years, and has discovered the secret which Aztec, Toltec and Spaniard vainly sought. Out of the precious shrub it has extracted the essential principles for the use and benefit of humanity. One concern immediately perceived the value of the discovery and put it to practical use. This was the now world-famous firm of Dr. J. C. Ayer & Co., of Lowell, Mass. Knowing the value of the drug, they imported it in vast quantities, and by means of most ingenious appliances extracted all its beneficent elements. Combining these with other ingredients, they produced Ayer's Sarsaparilla, which, from the onset, has been recognized by physician and chemist as the most reliable and effective blood purifier extant. Realizing its unspeakable beneficence, and desiring to benefit the human race, the Ayers proclaimed the fact to the world, and advertised the composition and properties of Ayer's Sarsaparilla in every publication of the globe. While one result was to bring into being a crowd of imitators, whose sole aim was to realize a fortune by trading upon the superb work of the Ayers, the real result was to make Ayer's Sarsaparilla the standard medicine of every physician and scientist in America and Europe. Years have passed since Ayer's Sarsaparilla was made public property, but never since has any manufacturer ever approached it in purity, efficiency, uniformity and strength. It has kept pace with the progress of the age, and is to-day the best and the most trustworthy blood purifier known to modern science.

THE POWER OF NIAGARA FALLS.—The amount of water falling over Niagara Falls is equal to 100,000,000 tons an hour falling 150 feet. The amount of coal required to raise such a weight up to the point from which it fell, which is a measure of the amount of power yielded by that water in falling, would require the consumption of 260,000,000 tons of coal, which is the amount of coal now consumed by the entire world. Now, if fifty per cent. of the power used to drive the first dynamo machine could be recovered from the second, and hence if the whole power of Niagara could be utilized, it might be distributed over the United States so as to give from that waterfall alone a power equal to the present entire mechanical force of the world, estimating that one-half the coal used is solely for mechanical purposes.

EXTREME VARIATIONS.—At Fort Benton, Montana, the records of the signal service show a range of 170 deg. in one year. Two years ago last summer it was 110 deg. above zero, and the following winter it was 60 deg. below.

BINDERS FOR THE AMERICAN ANALYST.

We have selected the "Handy Binder" for binding the ANALYST, because of the following advantages: It is elegant in appearance, strong, durable, and this new method of binding allows the opening of the pages perfectly flat, owing to the fact that none of the side of the paper is used. This method also permits the taking out and replacing of one or more papers from any part of the file without disturbing the other parts. After the file is completed, it ceases to be a temporary binder, and with its contents becomes a perfectly and strongly-bound book. Owing to the unusual size and strength of the linen binding cord in combination with two metallic binding strips (loops) the strength and durability of the binding is wholly unequalled by any method yet introduced. Price, sent post-paid, 75 cents. To any subscriber renewing his subscription at \$1 sent directly to this office during December, 1888, we will send one for 25 cents, and we will give one free as a premium for every new subscription sent to us with \$1.

DEADLY SOAP.—A man in Topeka, Kan., recently met his death from a peculiar accident. A cake of soap with which he was washing slipped from his hand and striking a tumor on his leg caused a fatal hemorrhage.

BUSINESS NOTES.

BUFFALO LITHIA WATER A SOLVENT FOR URIC ACID CALCULI.

E. C. LAIRD, M. D., HAW RIVER, N. C., IN "MARYLAND MEDICAL JOURNAL" FOR NOVEMBER.

The relief afforded by Buffalo Lithia Water to a patient of mine, Col. H., of this place, a sufferer from renal calculi, is, I think, worthy of some record. The first of May last he came under my care subject to frequent attacks of nephritic colic. Except as to the usual treatment for the relief of present suffering, I put him exclusively upon Buffalo Lithia Water, Spring No. 2, under the influence of which he in a few weeks passed four calculi, weighing from two to three grains each, which was followed by a disappearance of symptoms. Notwithstanding, however, the continued use of the water, after a short interval there was a return of these attacks, with increase both of frequency and severity, when he made a visit to the Buffalo Lithia Springs, where he used the water six weeks with the following results: Ten days after arrival he began to discharge at intervals large quantities of calculi and sand, which continued for several weeks, and afterwards gradually diminished until at the expiration of the six weeks there was only occasionally, and barely perceptible upon minute examination, a slight sandy deposit in the urine. At the same time improvement in the general condition of the patient was very marked.

The amount of calculous matter discharged may safely be estimated at from one to one and a half ounces. Under microscopic examination it was evident, I think, that the calculi were originally parts of larger formations dissolved by the action of the water. Analysis made by Dr. S. F. Whaley, resident physician at the Springs and consulting physician in the case, showed it to be uric acid.

Six weeks have elapsed since he left the Springs. Use of the water continued. The urine is free from sediment and normal.

It is proper for me to add that I was in constant attendance upon Col. H. during his stay at the Springs.

A CONVENIENT CALENDAR AND STAND.

The most convenient, valuable and novel business, table or desk calendar for 1889 is the Columbia Bicycle Calendar issued by the Pope Mfg. Co., of Boston, Mass. It is in the form of a pad of 365 leaves, $5\frac{1}{8} \times 2\frac{3}{4}$ inches, with blanks for memoranda. The leaves are sewed at the ends, so that any entire leaf can be exposed whenever desired. The pad so rests upon a portable stand that the entire surface of each leaf is brought directly before the eye. The upper portion of the stand is made of pressed pulp, with "Columbia" in raised letters at the top, the whole handsomely gilded and practically indestructible. Besides the date and ample room for memoranda, upon each slip appear quotations pertaining to cycling, and about type-writing and stenography, with occasional mention of the new Becker type-writer. Although this is the fourth year of the calendar, the quotations are fresh and new, and the information would, if placed in book type, make a fair-sized volume.

AYER'S POLYGLOT ALMANAC.

We suspect that few, who hang their Ayer's Almanac on its accustomed nail, from year to year, have any idea of the vast number of these pamphlets issued annually by the publishers, J. C. Ayer & Co., of Lowell, Mass., manufacturers of the famous Ayer's remedies. We are assured that from thirteen to fourteen million copies of Ayer's Almanac, in as many as ten principal languages, are printed every year. To accomplish this stupendous work, the publishers use a machine which prints and folds, ready for the binder, a hundred thousand almanacs daily, turning off at the rate of a hundred and eighty books a minute, and consuming about twenty-five miles of paper each day! These astounding facts and figures are given in the preface to a neat volume of the almanac for 1889, consisting of specimen copies of the several editions in English and in nine other languages; also pages of pamphlets in eleven additional tongues. This book will, we have no doubt, be appreciated by many as a rare literary curiosity.

HORSFORD'S ACID PHOSPHATE.

BEWARE OF IMITATIONS.

Imitations and counterfeits have again appeared. Be sure that the word "HORSFORD'S" is on the wrapper. None are genuine without it.

LOOK OUT for Imitations and Substitutes OF *Horsford's* ACID PHOSPHATE.

A variety of imitations and substitutes of this standard preparation have appeared under the name "Acid Phosphate," or a similar title, all of which differ materially from the genuine article.

Be sure the name "**HORSFORD'S**" is on the label. No other genuine.

N. D. ARNOLD, TREAS.

Providence, R. I.

Rumford Chemical Works.

WE USE SOAP.

WE USE PEARLINE.

DISTORTED HANDS will surely come to those who clean house and wash clothes in the old-fashioned way—with soap. How can it be otherwise? You rub—rub—rub, and you ache—ache—ache. You spend hours inhaling the hot steam and odors which rise from the tub, impregnated with the filth of soiled clothing, and with all this you have not obtained the best results.

WITH PEARLINE a delicate woman can do a large wash. You do not have to rub yourself and your clothes to pieces. You do not have to inhale fetid steam; when finished you are not too tired to see that your work is well and economically done, and that you have saved many hours of woman's hardest work.

JAMES PYLE'S PEARLINE is the modern soap. Beware of imitations.

FOR SALE BY

PARK & TILFORD, and ACKER, MERRALL & CONDIT.**NATRONA BI-CARBONATE OF SODA.**

(ABSOLUTELY PURE.)

The nature of the raw material from which **NATRONA BI-CARBONATE OF SODA** is made—viz., kryolith, a mineral containing *pure sodium*—insures a purity and uniformity of product which cannot be obtained from any other known material. In making **BI-CARB. SODA** from any other raw material, the use of sulphuric acid is a necessity, but none is used in any part of the process of making **NATRONA BI-CARB.**; hence its entire freedom from the slightest trace of arsenic, which is always present in ordinary soda. Its absolute purity and entire freedom from all traces of *sulphate of soda*, common salt and other impurities, render **NATRONA BI-CARB.** **NEARLY TASTELESS**, and being bolted through the finest bolting-cloth, insures the finest stage of division.

To these indisputable facts the attention of **CONSUMERS** of soda is specially called. They are **IMPORTANT**, and should influence both those who use and those who sell soda, to buy and sell **NONE BUT THE BEST**.

The **NATRONA BI-CARB. Soda** is kept in stock by almost every wholesale druggist and grocer throughout the United States, of whom it may be ordered.

Natrona Bi-Carb. Soda is unequalled by any other brand of English or American Manufacture.

PENNA. SALT MANUFACTURING CO.,**NATRONA CHEMICAL WORKS.****PHILADELPHIA, PA.****FOR THE THIRD TIME**

In our history we have been forced to move into larger quarters to keep up with the demand from our **New York, Worcester, Springfield, Providence, Lynn, New Haven, and two Boston stores, and our enormous mail trade.** We now occupy two-thirds of an acre of space devoted entirely to custom-work, turning out more garments than any house in the United States. You can order by mail by our system as safely as if you could call at one of our stores. To obtain the famous Custom-made **Plymouth Rock \$3 Pants**, first, send **6 cents**, for which we will mail you **20 samples self-measurement blanks**, and linen tape measure, provided you **MENTION THIS PAPER**, or if you cannot wait for samples, tell us about the color preferred, with **waist, inside leg, and hip** measures, remit \$3, together with 35 cts. to cover cost of expressage or postage, and we will forward the goods prepaid to any address in the U. S., guaranteeing safe delivery and entire satisfaction or money refunded. **Remember**, also, that we make to your order, Full Suits, \$13.25, Overcoats, \$12.00, and that for any cause we refund money at buyer's request upon return of goods, or make alterations or new garments free of extra charge.

PLYMOUTH ROCK PANTS CO.

Any one wishing to learn of our responsibility, may write the American Express Co., at Boston, (capital \$20,000,000) or consult the commercial agencies.

LEA & PERRINS' SAUCE.

Lea & Perrins', the original and genuine Worcester-shire Sauce, has been before the public over a half a century. Like all popular favorites it has long been the standard of comparison and the pattern for counterfeiters who not being able to imitate its excellence offer to the public imitations in bottling, labels and style of putting up. They dare not counterfeit the signature of Lea & Perrins which is on the red label of every genuine bottle, and of which this is a facsimile.

To be sure of obtaining the genuine article, see that the above signature is on the label.

ALTHENE SKIN SOAP

An absolutely pure and perfect soap for all purposes of the toilet, nursery, bath or sick-room. Has the approval of leading chemists and physicians, and is recommended by all who have used it. Price 25 cts. a cake, or 65 cts. for a box of three. Can be obtained of the retail druggists or from

COLDEN'S

ORIGINAL LABEL:

"Colden's Liebig's Liquid Extract of Beef and Tonic Invigorator."

LIQUID**BEEF TONIC.**

AN INVALUABLE AID IN THE TREATMENT OF ALL CASES OF DEBILITY.

Established 15 Years. Endorsed by Scores of Physicians.

Essentially Different from all other Beef Tonics.

Beware of Imitations.

COLDEN'S LIQUID BEEF TONIC consists of the Extract of Beef (by Baron Liebig's process), spirit rendered non-injurious to the most delicate stomach by extraction of Fusel Oil, soluble Citrate of Iron, Cinchona, Gentian and simple aromatics. An official analysis of this preparation by the eminent chemist ARTHUR HILL HASSALL, M. D., F. R. S., and endorsement by SIR ERASMUS WILSON, F. R. S., is printed on the label of each bottle.

Its Range of Action Embraces all Cases of Debility.

By the urgent request of several eminent members of the medical profession, I have added to each wineglassful of this preparation two grains of **SOLUBLE CITRATE OF IRON**, and which is designated on the label as "No. 1," while the same preparation, without Iron, is designated on the label as "No. 2." It acts directly on the sentient gastric nerves, stimulating the follicles to secretion and gives to weakened individuals that first pre-requisite to an improvement, an appetite.

I will, upon application, send a sample bottle of Colden's Liquid Beef Tonic to any physician in regular standing. Please ask your Dispensing Druggist (if he has not already a supply) to order it. In prescribing this preparation physicians should be particular to mention "COLDEN'S" viz: "EXT. CARNIS. FL. COMP. (COLDEN)." It is put up in pint bottles and can be had of Wholesale and Retail Druggists generally throughout the United States.

C. N. CRITTENTON, Sole Agent,**115 Fulton Street, N. Y.**

THE TORSION**Braided Wire Mattress.**

At all times a thoroughly ventilated and perfectly clean mattress, it cannot absorb odors, or retain exhalations or disease germs.

D. HAYES AGNEW, M. D., Prof. of Surgery, University of Pennsylvania, says:

"The Torsion Braided Wire Pillow and Mattress I regard as superior to anything of the kind now in use; well suited for either private or hospital use.

Prof. WM. H. PANCOAST, late Professor of Anatomy, etc., in Jefferson Medical College, now Professor of Anatomy and Clinical Surgery in the Medico-Chirurgical College of Philadelphia Hospital Surgeons, says:

"I have used in my surgical practice your Braided Wire, in the form of mattresses, pillows for the head and body, and short pillows for the arm and leg when injured. I find them most admirable, cool and light, yet affording perfect and elastic support.

I have saved a patient from bed sores by the use of the Braided Wire mattress."

WM. H. FORD, President Board of Health, Philadelphia, says:

"I have used the Torsion Braided Wire Mattress with great satisfaction, it is light and therefore easily handled; it is elastic and very comfortable. The case can be easily removed to afford a complete airing, a feature of great importance from a health point of view, it is an invention of great usefulness.

SCOTT'S EMULSION

OF PURE COD LIVER OIL WITH

HYPOPHOSPHITES OF LIME AND SODA.

THE STANDARD EMULSION OF COD LIVER OIL THROUGHOUT THE WORLD.

A BEAUTIFUL CREAMY MIXTURE—ALMOST AS PALATABLE AS MILK.

Having much greater remedial power than the crude Cod Liver Oil, without any of its nauseating effects.

Its PALATABLENESS, EASE OF DIGESTION, and long tolerance by most sensitive stomachs as well as its reliable therapeutic effect, has given it special favor with the medical Profession, and receives their unqualified endorsement and support.

Possessing as it does the tonic and stimulating properties of the Hypophosphites in combination with the strengthening and fattening qualities of the Cod Liver Oil—gives it a remedial value in WASTING DISEASES, ANÆMIA or IMPOVERISHED BLOOD, EMACIATION and CONSUMPTION—unequalled by any single or combined remedy in existence. The rapidity with which delicate children fatten and grow strong on this palatable Emulsion, is very remarkable.

Samples will be sent free except express charges to any wishing to try this preparation. For sale by all druggists.

SCOTT & BOWNE, New York.

A NEW USE FOR LIQUID PEPTONOIDS.

Successfully used in Dissolving the False Membrane in Diphtheria.

A Physician writes: "In an experience of over thirty years I have never used anything to equal your LIQUID PEPTONOIDS as a local application with a spray. It will dissolve the membrane and destroy the diphtheretic odor in less than twenty-four hours. I use the LIQUID PEPTONOIDS full strength, as a spray, two or three times a day, in bad cases."

Used successfully by another physician in two desperate cases:—"I was induced to try LIQUID PEPTONOIDS in two very desperate cases of DIPHTHERIA. I think I never saw throats more heavily coated with exudate than were these, and I think I never saw it more rapidly disappear than in these cases, by frequent spraying with your LIQUID PEPTONOIDS."

LIQUID PEPTONOIDS can be taken by patients unable to ingest food in any other form. In dyspepsia and loss of appetite its effects are positive, its digestive properties assisting in the digestion of food taken and its peptogenic properties quickly stimulating the natural digestive secretions of the stomach.

PANCROBILIN.

Prepared (in both Liquid and Pill form) from Extract of Pancreas and Bile.

This preparation is designed expressly to increase the digestion and absorption of fats.

We believe that the fat-digesting properties of pancreatine and bile are inseparable, and that without their union in the intestinal tract but little, if any, fat would be digested and absorbed.

PANCROBILIN will be found of great service in *Phthisis and other wasting diseases, Nervous Prostration, Constipation, Inanition, Malnutrition, Intestinal Indigestion* and wherever there is a failure to assimilate fats.

If the skin is first wet with LIQUID PANCROBILIN, the inunction of oils will be greatly facilitated.

LIQUID PANCROBILIN is put up in pound bottles. PILL PANCROBILIN is put up in bottles holding 100 pills. The coating of the pills will resist acid digestion, when given as directed, but will be quickly dissolved in the alkaline secretions of the duodenum.

PHOSPHO-CAFFEIN COMP.

(Granular Effervescent.)

Formula for each dessertspoonful:—

Caffein.

Acidi Phosphorici aa, grains, ss.

Antipyrin.

Ext. Apii. Grav. dulc. (Celery), aa grains, j.

Sodium Bromide, grains, v.

The satisfactory results produced by PHOSPHO-CAFFEIN COMP. in *Headaches, Neuralgia, Insomnia, Neurasthenia and general Nervous Irritability*, are not due to the effect of any one ingredient, but the happy effect of the combination. A thorough series of comparative tests have demonstrated the superiority of the above formula over any other in the market.

Tabasco Pepper Sauce

OR LIQUID PEPPER.

Is simply the Pulp of the Ripe Pepper Extracted by Pressure.

The seed of this Pepper was obtained from Central America, and by careful cultivation in Louisiana for many years has been so improved in strength, flavor and aroma, as to have become a new variety of Red Pepper, superior to all others. The pulp is so handled as to retain all the flavor, strength, aroma and color of the ripe fruit, and to keep unimpaired in any climate. It excites the appetite, promotes digestion, and is pronounced, by connoisseurs, to be the finest condiment in the world. For medicinal purposes it recommends itself by its purity, strength and diffusible form.

Manufactured by E. McILHENNY,
NEW IBERIA, LA.

For Sale by all Wholesale Grocers.

SWIFT'S

Choice Chicago Dressed Beef

— AND —

MUTTON.

CAN be found at all times in full supply and at popular prices at the branch houses in all the larger cities and is retailed by all first class butchers.

The trade of all marketmen and meat dealers is solicited for our Wholesale Branch Houses, and the public may rest assured that in purchasing our meat from dealers they will always receive the best.

THE ELECTRIC SUGAR REFINING COLLAPSE.

The collapse last week of the famous Electric Sugar Refining Company furnished a forcible illustration of the ease with which the public can be gulled by any plausible scheme for making money based upon the operation of mysterious forces. Capital having familiarized itself with all the natural avenues to profit, turns cautiously aside from them as being too narrow or already too crowded and plunges blindly into unknown paths in search of miracles. The eager desire to be the first in the field has a singular power to overcome business shrewdness gained by hard experience of fortune's fickle ways, and the savings of years are thus often invested in enterprises whose sole attraction, apparently, is the expectation of accomplishing the impossible. In the endeavor to make something out of nothing weak humanity is incessantly striving to assert the privileges of divinity. The application of electricity to sugar refining was introduced to public attention in this city about four years ago by a German

named Freund, who claimed to have discovered the process, but refused to impart the secret. The wily Teuton would take the inquirers into a room where there stood a barrel of raw sugar and a partially concealed electrical apparatus, and then causing them to withdraw from the apartment, would in the course of ten minutes re-introduce them and show them in the place of the raw sugar an empty barrel and a sample of beautifully granulated refined sugar. Gradually the bait took, and about a year ago a company was organized with a capital of one million dollars, the stock of which was bought with avidity here and in England, at prices ranging from \$200 to \$625 a share, the par value of which was \$100. Valuable property was purchased and arrangements were made for conducting the business on an extensive scale. But the time at length came when, according to the contract, the inventor was to reveal his secret to the investors. Freund died last spring but his widow held half the stock and the key to the valuable mystery. It turned out however that there was no mystery, and no key was needed other than that which unlocked the room in which the disgusted officers found all the raw sugar that had been purchased for refining, still in the same condition as when carried there, together with a quantity of refined sugar which had been used to furnish samples of the work done by the new "process." The disenchantment was instantaneous and complete. Upwards of a million dollars are estimated to have been sunk in this rainbow chase in order to afford a fresh verification of the adage regarding the fool and his money. That the electric method of sugar refining was a blind humbug from the outset was patent to all except the unlucky visionaries who wasted their money in it. Its fallacy was exposed three years ago by the AMERICAN ANALYST, in the subjoined article, which we reprint from our issue of December 1st, 1885:

It may be possible to cleanse and purify the crystals of raw sugar, eliminate the dirt, evaporate the moisture, and re-crystallize what has always been supposed was the uncrystallizable residuum of raw sugar by the application of the electric battery, but the majority of intelligent men have not yet reached that stage of advanced scientific intelligence that admits of their comprehending the probability of such an invention. It may be that the process of refining sugar that now occupies from twenty-four to forty-eight hours for its completion, and is the result of years of study and investigation, is all wrong, but there are a great many men in the world who are stubborn enough to believe that it is more nearly right than the vague and altogether incomprehensible claims of an adventurer. The sugar industry may be on the point of being crushed out of existence by this discovery, but those whose interests are at stake appear to contemplate their destruction with calm indifference. A French journal of science says that if this man can simply produce electricity at the cost he claims he has made the greatest discovery of modern science, let alone his attempt to refine sugar by the aid of the battery. Notwithstanding the fact that the inventor of this alleged process failed in his efforts to enlist capital in New York City, where, as before stated, the matter was investigated by a committee of experts, who pronounced it impracticable, he has, it seems, been more successful in England, where, it is said, a joint stock company has been formed for manufacturing refined sugar by the "electrical" process. Despite the asserted

caution of Englishmen, their country appears to offer a tempting field for American speculators and cranks. Hamlet was sent to England because he was mad, for the reason, as the grave digger says, in that tragedy, "T'will not be seen in him; there the men are as mad as he." The success of the inventor of the electric sugar refining process would lead one to believe that some, at least, of the descendants of Shakespeare's contemporaries retain the peculiarities of their ancestors. In view of what has followed from the visit of this extraordinary inventor to Great Britain, we shall not be surprised to hear of the departure of Mr. Keely, of "motor" fame, in the same direction. The latter gentleman has, according to his own statement, been on the eve of revolutionizing the science of applied mechanics any time these ten years; but, somehow or other, just as he is about to startle the country by making his invention public, a mysterious breakage of machinery unfortunately occurs—which also shatters the hopes of his confiding stockholders. It is to be feared that a similar disappointment awaits British investors in the electric sugar refining process.

A USEFUL CAUTION.

The *Sanitary News* calls attention to the fact that a postage stamp may in various ways convey contagion. One of the simplest and most plausible is that in which a postage stamp, partially attached to a letter to pay return postage is sent by a person infected with some disease to another person. The disease is transferred in the first place to the adhesive stamp through the saliva, and in being attached to the letter by the receiver the poison may be transmitted to him in turn through the saliva. Another cause may be the infection of the stamp with disease germs. The stamp, having been exposed in a room where a diseased person lies, may become slightly moistened and thus retain the germ. That this is true can be proved very simply by a microscopical examination. We often see a person holding change for a moment in the mouth, probably not knowing that investigation has shown that disease germs can be carried by money. If one could see through what hands the money has passed he would hesitate before using such a third hand. Silver money is as bad as paper money, but while many would hesitate to hold a dirty bank note in their mouth, they think that a silver piece, because bright, is probably clean.

QUANTITY RATHER THAN QUALITY.

The Minnesota State Board of Health has recently published its annual report, containing some interesting facts in relation to the prevalence of adulteration in food products. Commenting upon the report, the *Northwest Trade* of Minneapolis sets forth some philosophical news respecting the cause of the adulteration evil, the substance of which we reproduce. We must, however, in fairness confess that we cannot follow the argument to the precise conclusion our contemporary arrives at. Allowing the public to satisfy its desire to have the best of everything would not, we fancy, prevent greedy dishonesty from interjecting sophistications into the market, whereby larger profits might be real-

ized. The great difficulty in the premises lies more in the weakness of human nature than in the defectiveness of social institutions. All over the country, says the paper referred to, where food laws have not been enforced to check adulteration, the trick of mixing and deceiving the stomach has extended to every article in which it can be profitably practised. People should think a little before ascribing the cause of adulteration to the grocer or manufacturer. Were there no demand for such sophisticated food, no manufacturer would make and no grocer would sell it. But what has given the demand for adulterated food such an impetus? Without doubt, it is due to the high cost of living, and the combination among manufacturers to force up prices above the real value of the necessities of life. The difficulty of getting food commensurate with the labor exchanged for it is out of proportion. While rents, fuel and other necessities are so high the average human being is forced to economize somewhere, and the easiest place is found to be in those things which he puts into his stomach or in the goods which he puts on his back. Shame on it, that we must say that in the United States of America, the most prosperous country in the world, the majority of people must ask more for quantity than they do for quality. Instead of going to the root of the evil that makes such conditions possible, the attempt is made to put a plaster over the sore by passing laws making adulteration a crime. This is preventing rank weeds from growing by lopping off their tops. Let us root them out of the soil. This can only be done by sweeping away every hindrance that interferes with the natural law of supply and demand; by permitting every one to have the fruits of his labor; by granting to every one exact justice, and by not permitting a few to monopolize our natural resources out of which wealth comes. The majority of people want the best they can get, and were they allowed to freely satisfy their desires, the era of sophisticated food and shoddy clothing would come to an end. No quantity of severe laws filling our statute books will prevent the weeds growing.

CONSANGUINEOUS MARRIAGES.

At the annual meeting of the Mississippi Valley Medical Association in St. Louis last September, a paper by Dr. McKee, of Cincinnati, was read on "Consanguinity in Marriage." The alleged evils growing out of the marriage of relatives, however distant, have furnished a fruitful theme for social philosophers for many years, but the extreme views they advocate encounter an occasional check when common sense is brought to bear on the subject in the place of theoretical pre-judgment. Dr. McKee reasons that man being anatomically, physiologically and sexually an animal, he is subject to the same laws. It is well known, he proceeds, that in-and-in breeding is done by cunning breeders to improve the stock and put money into their pockets. The Jersey cattle have been bred for the past 150 years on a small island six by eleven miles. We

would not raise them for beef and oxen, yet they command a high price for their milk and butter. This was probably the recommendation of the first cattle on the island, and this quality has improved from time to time through in-and-in breeding. The ludicrous is approached when we enumerate the half a hundred abnormalities, among others whooping cough, which are ascribed to consanguineous marriages. We find certain factors leading to consanguineous marriages, viz., portions of country geographically isolated by mountains or sea, rendering communication with the outside world difficult; religious or political sects of an exclusive nature, and aristocratic ideas of position and wealth. As examples, note the percentage in Scotland, Martha's Vineyard, the Commune of Batz, and among the Jews and Quakers. The facts deduced by a careful study of the subject do not warrant us in supposing that the troubles complained of are a specific degenerative effect caused *ipso facto* by consanguinity. It would be better for the offspring were consanguineous marriage under medical supervision, but certainly no better than for all marriages to be under like supervision. We are warranted in concluding that consanguineous marriages, no other objection being present, should not be opposed upon physiological grounds.

A RAILROAD PREDICTION.

A railroad official who has given the subject a great deal of careful study says but two alternatives are presented to this country in making its future railroad history, viz.: either a radical amendment to the Interstate Commerce Law, or the gradual bankruptcy of all weak corporations and their absorption by the strong, until the whole land is divided up into railroad districts, all roads in each district to be controlled absolutely by one management. In one of these ways only he believes can the intricate problem presented by the long and short haul clause be solved.

SCIENTIFIC PARADOXES.

CURIOUS FACTS ABOUT ARTICLES OF COMMON OCCURRENCE.

The water which drowns us, a fluent stream, can be walked upon as ice. The bullet, which, when fired from a musket, carries death, will be harmless if ground to dust before being fired. The crystallized part of the oil of roses, so grateful in its fragrance—a solid at ordinary temperatures, though readily volatile—is a compound substance, containing exactly the same elements and in exactly the same proportions, as the gas with which we light our streets. The tea which we daily drink, with benefit and pleasure, produces palpitations, nervous tremblings, and even paralysis, if taken to excess; yet the peculiar organic agent called theine, to which tea owes its qualities, may be taken by itself (as theine, not as tea,) without any appreciable effect. The

water which will allay our burning thirst augments it when congealed into snow; so it is stated by explorers of the Arctic regions that the natives "prefer enduring the utmost extremity of thirst rather than attempt to remove it by eating snow." Yet if the snow be melted it becomes drinkable water. Nevertheless, although, if melted before entering the mouth it assuages thirst like other water, when melted in the mouth it has the opposite effect. To render this paradox more striking we have only to remember that ice, which melts more slowly in the mouth, is very efficient in allaying thirst.

TO THE PUBLIC.

We sincerely regret our publication of Dr. E. T. DARBY's endorsement of Dr. Mason's Combination Tooth Pick; as we now learn that his expressions were intended only for the private inspection of the inventor.

HORSEY MFG. CO., Utica, N. Y.
Manufacturers of the Celebrated

HARTFORD'S PROMINENT PHYSICIAN,

Dr. E. W. KELLOGG, expresses his appreciation, as follows:

"It is my opinion that from a hygienic point of view, the Ideal Felt Tooth Polisher offers decided advantages over the former methods of caring for the teeth; and as a beautifier of them it is unrivalled."

Prices:—Tooth Picks, 10c. per Case. Felt Polishers, 18 boxed, 25c. Holders for same, in bone, horn or celluloid, imperishable and attractive, 35c. **For Sale by all druggists, or mailed on receipt of price by**

LACTOPEPTINE.

The most important remedial agent ever presented to the Profession for Dyspepsia, Vomiting in Pregnancy, Cholera Infantum, Constipation, and all Diseases arising from imperfect nutrition.

Lactopeptine precisely represents in composition the natural digestive juices of the Stomach, Pancreas and Salivary Glands, and will, therefore, readily dissolve all foods necessary to the recuperation of the human organism.

CAUTION

We regret that we are compelled to caution the profession in prescribing Lactopeptine, but very careful investigation has proven to us clearly the necessity of it. Substitution of cheap and worthless compounds are being made in many cases where Lactopeptine is prescribed.

Lactopeptine is always UNIFORM, and its effects are SPECIFIC, and no one has ever been able to imitate its digestive value. If you do not obtain positive results when you prescribe Lactopeptine, you can be sure that some substitution has been made, and in such cases it may be necessary for the physician to prescribe Lactopeptine in the original ounce package to insure certainty of obtaining the genuine article. We can confidently make this assertion, knowing the scrupulous uniformity in digestive value of every ounce of Lactopeptine.

Lactopeptine has always been kept strictly in the hands of the Medical Profession, never having been admitted in any publications but Medical Journals. It is prescribed by the most intelligent and educated physicians in all parts of the world, and there are but few physicians who have ever used Lactopeptine that will not agree with the late Prof. L. P. Vandell, when he says: "Lactopeptine is one of the certainties in medicine, and in this respect ranks with Quinine."

In the various forms of Dyspepsia, in vomiting in Pregnancy, and in Mal-nutrition of children, there is no known remedy so positive in results.

P. O. Box 1574. THE NEW YORK PHARMACAL ASSOCIATION, NEW YORK.

THE DRESSED BEEF TRADE.

IT IS ESSENTIALLY OF CHICAGO ORIGIN.

Rewritten from the Drovers Journal.

Of the numerous enterprises that have had their origin and subsequent development in Chicago, perhaps there is none that is so clearly and indisputably a Chicago product as the dressed beef trade.

That the business is purely and legitimately American in its conception, prosecution and fulfillment can be readily inferred from every feature and characteristic that mark its operations at every stage, and also from the deservedly exalted rank it has taken in the commercial records of the nation.

That such results are directly attributable to Chicago's many natural advantages is undeniable, but nevertheless there are other causes which have led to the splendid success of the Chicago dressed-beef trade, and which should properly find mention in an article of this nature. The men who undertook to send to the epicurean East the primeest beefs of the "wild" West, in a condition ready for use and consumption, instead of on the hoof, were men whose reputations for bold enterprise and successful achievement were already universal, and the colossal proportions and widely-spread popularity of one of Chicago's foremost industries sufficiently attest that the metropolis of the West was again fortunate in having the development of one of her most prolific resources fall into the hands of men who, in their business career, knew no such word as "fail."

The Union Stock Yards Company also materially assisted the growth of the dressed beef trade at this point by the care and promptitude with which they provided accommodation for the rapid expansion in this branch of the live stock business, and so perfect have become the facilities at the Union Stock Yards for handling large numbers of cattle, that the ranchman on the plains and the farmer in the States think only of Chicago as the best market for their stock, where demand is never lacking, where competition is always keen, and where capital is unlimited.

To thoroughly describe the working of the dressed beef trade as conducted at the Union Stock Yards, it is necessary to begin with the receipt and handling of the cattle used in that business.

There are ninety-one fully organized commission firms doing business at the Stock Yards engaged in the receiving, handling and selling of live stock. It is a low estimate to state that each firm has attached to their office at least one man who has a separate connection of his own in the country and whose correspondence, etc., is quite independent of the firm to which he is attached.

Formerly cattle of every grade were carried in the old square boxes called cattle cars, into which the ani-

mals were crowded without any regard for bruise, breakage or even death. To-day, happily, that inhuman system is changed to a great extent, and the "Palace" car and "Stable" car have replaced the old square box monstrosity, especially in the carrying of the best grades of cattle.

Singularly enough in this connection, we discovered a very significant fact that argues strongly in favor of the shipping of the beef dressed as against shipping the cattle alive to the Eastern markets.

One "stable" car line has fourteen hundred cars running over Western roads from points in the West and Southwest hauling cattle to Chicago, while at the same time they have less than one hundred cars running from Chicago to points in the East.

Western shippers, and especially the big ranchmen, are the most regular patrons of the "stable" car as they find that they save enough by the lighter shrinkage of the cattle in transit together with the substantial gain in the superior condition of their stock on arrival at market, to more than pay for the extra cost of the "stable" car over the common cattle car. The "stable" cars are thirty-six feet long and eight feet four inches wide on the inside, with portable partitions dividing the car into three compartments. Each car is furnished with hay racks and water troughs, the former are filled with hay at point of embarkation and the latter are supplied with water at regular watering stations on the route. There is no crowding. The "stable" car generally contains 18 to 20 steers, usually of the best grades, such as are technically known to the trade as "dressed beef," "shippers" and "exporters."

On being unloaded these cattle are handled with the utmost care by the Stock Yard Company's employees and the cattle brokers' men, who are on hand to receive them. One rarely sees the "scrub" class or low-grade cattle arrive in any other but the common cattle car. Attention seems to be chiefly devoted to getting the higher priced and better grades to market in the best condition possible, and it is astonishing to see the huge prize-winners from the plains come to hand after a long trip in the stable-car looking as fresh and with almost as much of the bloom of the country on him as when he left the range.

Right here the question naturally suggests itself: Is it not better to have these animals killed here in their present fine condition than after they had stood the market here and been shipped 1,000 miles further east with all the fever and fatigue of travel and other unavoidable hardships consequent thereon? Common sense would seem to dictate the affirmative in reply.

From the platform where the cars are unloaded the cattle are driven to the pens located in the division of the yards to which they belong by virtue of the road that brought them in. The commission merchant orders them fed and watered, and places them on sale under the most advantageous surroundings his experience can devise.

There are four firms at the Stock Yards engaged in the dressed beef business. They are Armour & Co., Swift & Co., the Hammond Co. and Nelson Morris.

Armour is represented on the yards by seven cattle buyers and five weighers. Swift has six buyers and five men to catch weights, Hammond has three buyers and two men to see after the weighing, and Morris employs four buyers and four weighers.

The buyers here referred to are supposed to know exactly the requirements of the houses they represent, and in the course of the day's trading have to reject a good many animals that are not, for various reasons, suitable to their wants. They are particularly careful to reject any "unmerchantable," "crippled" or "diseased" animal that may, perchance, happen to be in the drove, and very frequently have to assort out and reject animals of inferior quality that are not up to the grade their orders call for.

A stranger cannot fail to observe that much as the buyers may "banter" and "dicker" over the price, there still appears to be less anxiety about that part of

the deal than about the suitability and quality of the drove they are negotiating for, and it not infrequently happens that a buyer will leave a drove of cattle that he had spent considerable time in trying to purchase simply because he fails to get privilege from the salesman to assort them to the extent he considers necessary to fit them for his orders.

There is invariably a "weigher" in attendance on each buyer, so that when the latter makes a purchase the former is on hand to follow the cattle to the scale, where they undergo a further scrutiny from him previous to being weighed. Everything being found satisfactory, the cattle pass on to the scale, are weighed, and from thenceforth are the property of the packer, to be driven with many more later in the day over the viaduct to the slaughter-house.

Under the authority of the Health Department of the city, the inspection at the Stock Yards is very rigid. The staff comprises three officers of whom we will make this passing mention, to show their eminent fitness for their official positions by stating that each one of them is by trade a practical butcher, and the knowledge acquired in that calling, combined with untiring zeal in the performance of their duties, constitute a sanitary inspection corps that any city might well feel assured was perfectly capable of taking care of the animal food supply of its citizens.

It is no exaggeration to say that a more redoubtable barrier against the invasion of the Stock Yards by any "diseased," unthrifty or undesirable animals than this trio it would be difficult to find. They are almost ubiquitous while on the "warpath"; and any animal not fit for the food of man finds swift condemnation at their hands.

The Illinois Humane Society has also an officer stationed here, and since his advent on the yards many cruelties to animals and other barbarous practices have been abated. The "prod-pole" has been almost totally discarded, so that a driver wishing to urge his steers to greater haste has to do so with some more humane though less persuasive weapon. In this connection it is proper to state that some two years ago both Messrs. Swift and Armour sent into the country in several parts of the West on a mission to stop, as far as possible, the use of the "prod-pole" by having offenders of this class arrested wherever they found cause to do so. The crusade was productive of many beneficial results.

Following up our description of the *modus operandi* of the dressed-beef business, the slaughter-house will next be the scene of our investigations, and for the first time since our hitherto pleasing task began, we find ourselves on what is very germane to our subject, "the horns of a—dilemma." Which of the great beef-houses shall we visit? All are typical houses and emblematic of Chicago enterprise in every respect; so it may be set down that having seen one you have seen all the houses in the business; but as what is considered by priority the best "show" house in the Yards is close at hand, we will make it the field of our deliberations.

Approaching the cattle pens in which were corralled the doomed bovines, awaiting the attentions of the "Knights of the Knife and Steel," one would be led to suppose that a fire in this part of the building was being fought by a small gang of men who worked at a large hose, but no such casualty had taken place, the *soi-disant* firemen were simply giving the steers their customary cold-water bath to cool them off preparatory to being slaughtered. This introductory preparation, simple as it may seem, has been found a very effectual method of cooling down any heated temperature of the cattle from the weather, natural excitement or any other cause, and for getting them in the best possible condition for killing, though of course this treatment is only used in hot weather.

Generally the first timid feeling experienced upon entering one of these monster slaughtering establishments gives place to one of admiration of the perfect system that prevails in the midst of what seems the most chaotic surroundings. Small armies of skilled and

unskilled employes work with almost as much purpose and regularity as men under military discipline; and of such an awfully impressive character is the scene presented by a vast abattoir in full blast, with its countless multitude of brawny men who participate in various ways, under skilled direction, in the wholesale slaughter that is going on, that one carries the remembrance of it vividly in his mind when all else that was curious and interesting are forgotten.

In rotation and by sure stages through a long line of pens, the cattle approach the fatal "felling" pen, where they are despatched with lightning rapidity by a man who handles the rifle with the unerring aim of an Indian scout, or the spear with the dexterity and precision of a Cosack lancer.

The lifeless monster of the plain is next hauled from the "felling" pen out on to the floor or "skinning bed," where he is bled, the head severed from the body, and the body hoisted by the hind legs to the iron "runs" or "rails" overhead, where it is allowed to hang for at least ten to fifteen minutes, to give the blood every chance to drain from the body.

Here it may be remarked that this system of bleeding differs radically from the method in vogue formerly, when the animal was bled and allowed to lie on the floor until at least half the skinning and other parts of the work of "dressing" was done. Whatever probability there was of coagulation taking place in the veins of the dead animal under the old system, there is no possibility at all of it occurring with the plan adopted at the dressed-beef slaughter-houses where the body is hoisted while the circulation is hot and active, with all the principal arteries cut at the throat to accelerate the downward flow of the crimson torrent. The body is again lowered to the floor, the entrails removed, the bullock "sided" (i. e., the sides skinned with a long, peculiar, free sweep of the knife, requiring much skill), and again hoisted to the "runs." The hide is next "dropped," and the carcass thoroughly washed on the inside and wiped down on the "flesh" or outside with a clean, dry cloth, which is used with a tenderness in the hands of the butcher suggestive of unusual attention to this particular part of his work, for it is at this stage that the genuine butcher considers he is really "dressing his bullock." All his mechanical pride is aroused instinctively by the quality and proportions of the noble "critter" that hangs before him, and his ambition leads him to put on the numerous little touches of the "flesher's craft" that produce a picture in "pink and white" on the carcass of beef as it hangs on the "runs." As soon as the artistic work is finished on it, the carcass is "cleft in twain" and run into the cooling room, where it remains from thirty-six to forty-eight hours if heavy and twenty-four hours if it be light weight. It might be stated here that once the carcass of beef leaves the hands of the butcher and enters the cooling room, it travels on wheels on the iron "runners," and can be switched to any part of the establishment on this "elevated railway" by an ingeniously contrived system of switches, thus obviating the necessity of handling the beef only as little as possible when "toting" it from one department to another.

The cooling rooms devoted to the exclusive use of the shipping beef are four in number, each measuring 120 feet square, and has a capacity of 900 carcasses, or a total of 3,600 for the four rooms. Though the cooling rooms will each contain snugly 900 dressed cattle, the management does not consider it wise to crowd them to their utmost capacity, and therefore generally hang between 600 and 700 carcasses in each room, thereby allowing a freer circulation of air.

The temperature of the cooling rooms and the refrigerator cars is kept as nearly equal as possible at 36 to 30 degrees, and by this steady, uniform temperature, the best results are obtained.

The entire establishment is lighted by electricity, and the effect of the brilliant light on the rosy-tinted, healthy-looking, well "mixed" and "marbled" beef on the varnished woodwork, on the brightly shining

hooks and other "tinned" ironwork, and on the evenly laid "carpet" of deal sawdust, which softens at one and the same time the sharp rays of the electric light and the elastic tread of the white-frosted operatives, make a picture of cleanliness and order that would captivate the heart of a New England housewife.

Between the cooling rooms and the platform where the refrigerator cars are drawn up, there is a shipping room. The beef that is ready for shipment is run out into this apartment, where it is weighed, quartered and inspected. This room should be called the "custom house," for the inspection here is very rigid; the inspector exercises the keenest judgment on every individual quarter, so that anything showing the least blemish shall not be permitted to pass out to the refrigerator car.

The refrigerator car is 29 feet long and 8 feet 2 inches wide on the inside. It is 7 feet 4 inches from the floor to the cross bars on which the hooks hang, and 1 foot 2 inches above the cross bars to the roof of the car, this latter space admitting of an uninterrupted current of air. The car is supplied with galvanized iron tanks at each end. These tanks are filled from the outside through small "hatchways" in the roof with a mixture of "pounded" ice and coarse salt. The tanks thus filled quickly become cold and create a temperature of 36 to 38 degrees in the closed car. The chilling influence of the tanks forces a circulation in which the heavier cold air descends and displaces the lighter and warmer current, which naturally ascends and becomes again chilled to a much lower temperature by contact with the tanks. By this process the air in the refrigerator car becomes rarefied, and, therefore, is the best means known to natural law to eliminate moisture from meat and leave the fibrous substance in a condition to "keep" and improve it in its digestible qualities by the "keeping."

For confirmation of this theory one has only to refer to the custom prevalent in some of the Western States of preserving beef by "jerking" or drying in the dry atmosphere of the altitudinous regions where it is practised. And again, in this connection, it is a noteworthy fact, that at Denver, Colorado, a quarter of beef on being hung out of doors and exposed to the action of the atmosphere will "shrink" 10 lbs. in twenty-four hours, or at the rate of 40 lbs. to the carcass.

To the uninitiated in the scientific principles of the system, the foregoing cases will convey an intelligent understanding of the principle on which the dressed beef refrigerator car is operated, and if one were disposed to still further follow the comparison, he would find analogy enough to satisfy the most sceptic, in the fact that the two cases above cited, the beef is dried and preserved solely and simply by the action of dry rarefied air and by identically the same means. Without the aid of chemical or other doubtful agencies, the beef is cooled and preserved in the refrigerator car.

Between the "ice-box" that flourished some few years ago and the splendidly equipped refrigerator car of the present day "comparisons are odious," in fact there is no comparison. The plan of the former ice-box was to smother the meat in ice. That idea might do well enough to work on at Nova Zembla, but the Chicago dressed beef man has a refrigerator car modeled on nature's laws, in which the meat cannot come in contact with the ice by any possible change, and consequently is never moist, but always dry and cool, and ripens every hour it is in transit to the Eastern market.

The refrigerator car when loaded contains from thirty to thirty-three carcasses of selected beef, averaging about 650 pounds each, or equal to twenty thousand to twenty-one thousand pounds. The hind quarters are all hung in one end of the car and the forequarters in the other, presenting the appearance of what a professional stevedore would enthusiastically call a "well-trimmed cargo."

The cars are iced the day before shipping and re-

filled just before loading, and re-iced every twenty-four hours at regular stations on the journey east.

Better than volumes of descriptive information to eastern people would be the examination of a Chicago dressed beef car on its arrival at the point of destination. It would furnish them with a subject for study for more than the traditional nine days, and perhaps would set them thinking like the Auburnites while contemplating Goldsmith's "Village Schoolmaster,"

"And still they gazed, and still the wonder grew."

It would certainly be a revelation to them, for there can be no doubt whatever that the manner of handling dressed beef by the firms who are engaged in it in Chicago, is a triumph of modern science in its application to the improvement of the food of the people. Experiments have proved that this beef will keep sweet from two to three weeks under passably favorable circumstances, and will eat better during or at the expiration of that time than meat killed and eaten within a couple of days.

When the cars return empty they are side-tracked at the packing house and there undergo a scrubbing and cleaning with boiling hot water until they look new again. The hooks being "tinned" instead of galvanized, are also washed, polished and brightened. All other iron work in the interior of the car is washed and thoroughly dried, and finally the car is allowed to stand twenty-four hours with the doors open, so that it will be perfectly aired preparatory to being again loaded for the eastern market.

Having shown how the beef is prepared and how the faultless machinery for handling it is operated, it is proper to explain the mode of distributing it in the east. There are agencies or depots for raising and distributing the beef located at numerous points through the Eastern States, including all the large cities as well as cities and towns of smaller size and less importance. These depots are constructed and "run" on principles the exact duplicate of the present houses at Chicago. The beef is sold and distributed through the surrounding country, until every town and village in the district that is at all accessible, either by wagon, road or rail, is well supplied with Chicago dressed beef. It is not claiming too much to say that by a system so far reaching in aim, so progressive in management and so aggressive in commercial spirit, the prime beef produced in Western America is placed within the reach of all in better condition and at less cost than the most sanguine economist dared hope for before the introduction of improved machinery into what was indeed a very crude business.

In the pineries, the fisheries and the collieries, where "pork and molasses" held sway, the bill of fare has undergone a decided change, and no one will deny that the change is for the better by a "large majority."

In the places named the old relics of pioneer days—"pork and molasses" and "hog and hominy"—have given place to "beef and butterine," and in the great manufacturing centres the unskilled laborer and the artisan have become so habituated to the use of good beef, that one can imagine them giving vocal expression to their preferences in the words of the Englishman who sang:

"My dame likes her puddings,
My boys like their pies,
But I like my dinner of beef."

Statistics show that the number of hogs killed in the west has decreased in two years, one million seven hundred thousand, whereas the increase in the number of cattle killed has been proportionately as great, and most assuredly to shut off the dressed beef trade to-day would ruin the ranch and great cattle growing interests of the west.

The week ending Sept. 22, 1888, there was received at the Union Stock Yards 71,300 head of cattle—it was the banner week for receipts—and the four dressed beef firms, Swift, Morris, Armour and Hammond, took two-thirds of the total receipts, and still they were like Dickens' Oliver, "asking for more."

The conclusions to be drawn from the foregoing are as follows: First, that the Chicago dressed beef shipper uses every endeavor to get the best material for his trade that money and trained judgment can obtain. Secondly, that he takes every precaution that untiring vigilance can suggest to exclude from the make up of his goods anything open to the least suspicion of unfitness, and lastly, that he literally "shuts his eyes on expenses" in his determination to keep Chicago dressed beef where he has placed it to stay—in front and without a rival.

MICHAEL FOSTER.

TO COOK DRIED FRUIT.

SOME SIMPLE HINTS DESERVING OF ATTENTION.

It may seem like a broad, sweeping assertion when we state that nine out of every ten persons who undertake to cook dried fruit make a positive failure. The usual method followed is a very poor one, that of selecting the fruit to be eaten at lunch, dinner or tea, two or three hours prior to using it, rinsing it in a little water, then placing it in water and allowing it to remain to soak for two or three hours only, then pouring off the water in which the fruit was soaked and applying fresh water, putting it on the stove and cooking it thoroughly. Such a manipulation as this is calculated to produce the poorest possible result, if it does not actually ruin the fruit. Many people consider dried fruits hardly worthy of their time and attention from the fact that after repeated trials they find so little of value—the fruit having lost its original flavor, is tasteless and not at all palatable. If the following method for cooking dried fruit is followed, a directly opposite result will be realized. Select the fruit that you intend to use, rinse it thoroughly in clean, clear water, then place the fruit to soak in an earthen dish, with sufficient water to cover it, from ten to fifteen hours before requiring it for use. Then place it on the back of the stove in the same water in which it has been soaked, which contains the flavor and nutrition soaked out of the fruit, and allow it to simmer slowly, just coming to a boil occasionally, until it is entirely cooked through, add sugar as the occasion requires to make it palatable. It can be served either hot or cold as you desire; as a rule, if it is placed one side and allowed to cool it will be fully as palatable. By this method you will secure a wholesome and palatable dish, full flavored and resembling in appearance, size, taste and flavor the original green product, as near as is possible.

INTEMPERATE TEMPERANCE.

HOW MANKIND STRIVES TO REACH RIGHT ENDS BY WRONG METHODS.

The Frenchwoman who, after quenching her thirst with a glass of water, declared that if it had been wicked to drink it, it would have been a most delightful beverage, struck a chord, the truth of which has been demonstrated by the tide of events ever since the fall of Eve. An unwise crusade against a supposed evil often has the effect of increasing rather than diminishing its power, and laws that are arbitrary frequently counteract the intentions of the lawmakers. This was never more forcibly illustrated than in the total incompetency of the recent fantastic attempt to manufacture a temperance society by legal enactment. Human law like all laws of nature should be made to harmonize with the requirements of the surroundings. Otherwise, like the fable of the house divided against itself, it cannot stand. The laws of hygiene for instance require that the germs of disease should be destroyed by the adoption of sanitary regulations whereby they are deprived of the power of disseminating their poison and propagating disease, herein the laws of nature and reason combine and the result is health instead of sickness. The making of state or municipal laws having for their object the promotion of abstemiousness in food or drink, can have no force so long as they are antagonistic to personal liberty, and tyrannical in their bearings; and they can have no greater effect toward the promotion of temperance, than would result in the use of blowing soap bubbles to clear a hazy atmosphere. Education stands in the same relationship toward temperance as does sanitary regulation, to the prevention of disease. The education of which we speak is that which enlightens the mind, softens the heart, gives strength of character and self control, and teaches each individual to be a law unto himself. Education like charity be-

gins at home and is thrice blessed. Its sphere is the domestic circle, from whence it undulates through society like circling waves; too often the spirit of illiberality is sown where the seeds of nobility of character should alone be nurtured. The young are indoctrinated with the idea that temperance means total abstinence, and that to imbibe any alcoholic beverage is a deadly sin, and when maturer years has ripened the judgment, and the man discerns the fallacy of these early lessons, he will be more likely to break loose from the ideas that were thus inculcated and run into excess, than if his early education had not been characterized by such inconsistent teachings. The prohibitionist attempts to supersede the necessity for self-restraint by the removal of temptation, if logically carried out to its sequel, would be to destroy property lest any one should steal, annihilate money because it is the root of all evil, forbid the existence of women because they debauch mankind, or call upon the Almighty to cause all vegetation to wither because it contains the alcoholic germ. If these social reformers would exert their influence toward the creation of a healthy domestic atmosphere, by such teaching as we have indicated instead of spending their energies in such an *ignus fatuus* manner, we would ere long witness a change for the better in the habits of the people. There is a great deal of mistaken sentimentalism manifested toward the drunkard, whose place should be behind the walls of the penitentiary or of an inebriate asylum where he should be treated as one who has broken the laws of both God and man. If such men were punished thus, there would be very little drunkenness in comparison with the state of society where prohibition reigns over all.—*Western Broker.*

A PERFECT HOME.

A BRIGHT-FACED MOTHER THE KEYNOTE TO DOMESTIC HAPPINESS.

The late Helen Hunt, writing of a perfect home, said: "The most perfect home I ever saw was a little house into the sweet incense of whose fires went no costly things. A thousand dollars served as a year's living for father, mother and three children. But the mother was the creator of a home; her relations with the children were the most beautiful I have ever seen; every inmate of the house involuntarily looked into her face for the keynote of the day, and it always rang clear. From the rose bud, or clover leaf, which, in spite of her hard housework, she always found time to put beside our plates at breakfast, down to the story she had in hand to read in the evening, there was no intermission of her influence. She has always been and will always be my ideal of a mother, wife and homemaker. If to her quick brain, loving heart and exquisite face had been added the appliances of wealth and enlargements of wide culture, hers would have been absolutely the ideal home. As it was, it was the best I have ever seen."

INNOCUOUS DESUETUDE.

WHAT HAS BECOME OF THE NEW YEAR'S DAY OF OUR KNICKERBOCKER FOREFATHERS?

A nameless, or at least an anonymous poet, writing a number of years ago about the early history of New York city, mentioned

"The good old days when doughnuts were made as big as bricks,
And 'twas not though unmannerly to eat as many as six."

Then he went on, and bewailed him, as the fashion of some poets is, that the olden observances of festal days, especially that of New Year's Day, were passing away, and were no more to be relied upon to gladden the heart of man.

This is true! It is by no means a fresh and original reflection, anent the American, that he neglects the

hoary past, and ardently woos the glowing future, unfaithful even to the present, so that he can gain fair promises from the love to come. We do not quarrel with him. We are also American, but it is well, even for us, who are pledged to the mystic, wonderful, and intricate secrets of chemistry, to inquire into the reasons why we neglect the old for the new, and to ask whether it is altogether the part of wisdom to do it.

"It is well to be off with the old love, before you are on with the new,"

sang a philosopher, in rhythm. But is it possible for us to rid ourselves entirely of the past, before we embark on that cruise through futurity which entices every adventurous soul? It is said of humanity that pre-natal education can never be thoroughly unlearned. If this is true, the old order, though it change, will influence the new, and perhaps the leaven of the past working after the manner of all leaven, may leaven the lump, no matter what the later predilection may be.

We do, however, change our manners and our customs. The New Year's Day, just passed, has shown it, as every great occasion shows it. That day, being typical of general observance, may be described, briefly, to point the moral, if it be a moral. The New York observance of New Year's Day is as purely a Knickerbocker custom as anything could be. Logical and apposite in its inception, it first found place, so far as we know, only among the Dutch worthies who laid the foundation of the greatness of our city. They were not many, but they were doughty and mighty. It was no "Dutch courage" that made them the heroes of our early days. Phlegmatic and slow, forceful and magnificent in their own quaint way, they kept the time to think. We think to-day, but we do not take time for the purpose. They remembered that as the years went by, it was well for comrades to clasp hands from time to time, and they founded the custom of New Year's calls.

It was a graceful and a most apposite thought. Men and women who knew that they were together on earth for only a brief term, pledged one another in friendship at the opening of each new year. No one was worse, but every man was stronger for knowing that he had strong bonds and ties of friendship here and there.

Then, "one good custom" did "corrupt the world." It came to pass that young New Yorkers, copying their forefathers, made the day an occasion of unreasonable license. To greet one's friends is well, but to shake the cold and unresponsive hand of casual acquaintance all day long, is profitless and meaningless, and it took New York a short time only to find out the fact.

So, as we have just learned definitely, New Year's Day is an occasion which is no longer remembered in the old way. The day just past was one on which New Yorkers did not go from door to door, visiting old friends and wishing to each, happiness and prosperity for another of the years that are all too few for the average man's accomplishment of purpose. We have distinctly abandoned an old custom. Why?

It would be easy to say that the city has been enlarged, and that the horizon of daily life now takes in too great a scope for a man to cover the entire ground of his circle of acquaintances, even by the use of a cab at \$2 an hour. This, however, like other patent explanations, is insufficient. If the spirit of the festival, and it was a true festival, survived, some measure of observance would remain, and it is a fact that New Year's calls are no longer customary.

The reason is simple and is strong in its very simplicity. The custom dies out because it has not, or seems not to have sufficient utility. Men no longer call. Women no longer "receive" on New Year's Day. It may be well to abandon a custom that has become too onerous for its observers, but it is well to stop and consider whether it be not well to preserve some customs for the very sake of maintaining the spirit that established them, even though it lack utilitarian value. The people without a past may perhaps fall into as evil a case as a people without a future.

TOMATOES.

THEIR RECENT ADOPTION INTO GENERAL USE IN ENGLAND.

American readers, accustomed to see tomatoes in some shape on the table nearly every day of the year, will scarcely appreciate how nearly that familiar vegetable comes to being a rare delicacy in England. We quote the following from the *London Tatler* of recent date:

Ten years ago it was an exception to find this delightful fruit on the tables of any but the wealthy; but to-day they are to be found in most houses during the season, their extensive cultivation having brought down the prices so as to make them come within the reach of all. The tomato, or love apple as it was formerly called, originally came from South America, but it was not until the climate of the United States was found to be eminently adapted to their growth that they came into general use, the taste for the same spreading to Europe. It is, in addition to its valuable hygienic qualities, one of the most profitable fruits to cultivate, and we know of one private gentleman who sends no less than one ton to market daily in the early season, the price paid for the same averaging 6d. per pound, all of them being grown under glass. Few come to perfection in the open air, owing to the short duration of sunshine in England. Like the olive, it was a long time before people became accustomed to their peculiar and delicate flavor, but each day they grow in popularity, so much so, indeed, that Cape Town has been requisitioned for a supply of the same when they are out of season here.

BRIE.

HOW THE CHEESE OF THAT NAME IS MADE.

A cheese that makes the epicure's palate bob with delight is called "Brie," or "Fromage Coulommiers," as one of the brands is called. Brie is the name of the province in France where this cheese is made. Those French peasants, in making this delightful cheese, set the milk for twelve hours, then skim it. Twelve hours later the skimmed milk is curdled with rennet. Twenty-four hours after curdling the curd and cream in equal parts, are put together in moulds, spoonful by spoonful. The tin mould, which is topless and bottomless, rests on a straw mat—single straws laid side by side to cover a surface of about twelve inches, and this is held together by a woof of two or three threads. This mat lies on a thin board, resting on an inclined shelf, to drain off the whey. After two days, it is turned out upon another straw mat, which rests upon a mat of osier, and lightly sprinkled with salt. It is then turned every day until cured. It never feels the heat of fire. After this it will keep a year, provided you can keep it away from the mouths of people who know a good thing when they see it.

OLIVES.

THEIR VARIETIES AND DIFFERENT DESIGNATIONS.

The designation of "Queen" has no reference to size, only the variety, they being round—the others oval—in shape. The olives put up for table use by the Bordeaux bottlers are of several different varieties. The large Spanish olives, known to us as "Queen Olives" are known to the trade as "Padrones Sevillas." These by the way, are quite a distinct variety from the other, varieties grown in Spain, known as "Manzanillas," which are used for making oil, the "Gordalles," having much more meat but less oil. The smaller olives put up in Bordeaux are principally of French growth and are known as "Amelleaux," "Verdalles" and "Lucques," the latter called here "Crescent Olives" on

account of their shape, and are much preferred to any other for table use. The "Verdalles" have a strong, full flavor, and are much used for sauces, to be served with meats, while the "Amelleaux" have a little more oil and less flavor. There is also a fourth variety, known as "Picholies," similar to the "Amelleaux" in character, but larger and longer. "Olive farcies" are Amelleaux olives stuffed with anchovies and capers. As a rule, the American trade prefers the "Queen Olives" on account of their size and fine appearance, the smaller size being as large as the largest of other varieties; but in Europe the smaller olives are quite generally preferred on account of their flavor and the finer quality of the meat.

WHAT BEEF COSTS.

THE PROFITS OF THE RETAIL BUTCHER EXHIBITED IN DETAIL.

The question has frequently been asked why it is that when the newspapers quote the wholesale price of beef at from four to seven cents a pound, the consumer is compelled to pay as much as twenty or twenty-three cents a pound. To answer this question intelligently the AMERICAN ANALYST detailed one of its staff to make the necessary inquiries, and we give herewith the itemized results. A carcass of beef, weighing 750 lbs., cut into loins, rounds, chucks, ribs, plates, shanks, flanks, kidneys and necks, will make the following product, at the retail price stated. The average wholesale price of such a carcass in New York is seven cents, or \$52.50 for the carcass, which, when retailed, as shown by the table subjoined, would make \$92.12, or a profit of \$40.62 upon an investment of \$52.50, which would certainly appear to the outside observer as a pretty good profit to the retailer. It is true that from this profit must be deducted the expenses of the retailer's business; but, nevertheless, it also proves conclusively that the retail butchers have no grounds for complaint against the Chicago dressed beef men, nor can the public have unless it is that the prices of meat at retail stores are as high as they were when cattle sold at higher prices; but the remedy for this should be demanded of the retailer, whose prices have not been reduced in proportion to the wholesale price. We may add here that the retail prices given are the lowest prevalent, and where there is any variation, it will be found that the prices demanded by retail butchers are somewhat higher. In any case, it should be borne in mind that as for quality, Chicago dressed beef is always the best, having the advantage of more careful selection, better dressing, and consequent tenderness.

A GLOSSARY OF MICROBES.

CLASSIFICATION OF THE MICRO-ORGANISMS OF FERMENTATION AND DISEASE.

Mr. W. Hamlet gives the following classification of microbes. 1. Microbes which appear as points are called *monads*, *monera* or *micrococci*. They are motionless, and may be regarded as the spores of other microbes. 2. Motionless linear microbes—the *bacteridians* and the *bacilli*. To them belongs *bacillus anthracis*. 3. Cylindrical mobile microbes, having rounded ends or contracted in the middle so as to form an 8, are the *bacteria* proper. Among them is *bacterium termo* of putrefaction, and the commonest of all. 4. Flexuous mobile microbes. They look and act like eels, and differ but little from the equally active bacteria. They are the *vibrios*. 5. Spiral microbes, resembling a corkscrew and mobile; *spirilla spirochetes*. Their presence in human blood appears to be connected with intermittent fever. 6. Microbes with heads, very active, having globules larger and more refractive than the rest of the body at one or both ends. These globules are apparently spores ready to be detached from a bacterium—*bacterian capitatum*. Besides these six principal states, the microbes form agglomerations or colonies that often notably changed the aspect of the elementary cells, and which have received various names. Agglomerations in microscopic masses, surrounded by a jelly that sticks them together and deprives them of motion, are called *zooglaea*. A non-gelatinous membrane formed of motionless bacteria is *micoderma*. Bacteria attached end to end in a string form filaments of *leptothrix*. A number of spherical micrococci joined one after another form the string of round grains called a *torula*. A considerable number of species may be included in each of these divisions; and there does not appear at present any way to distinguish by sight a disease-producing bacterium from a harmless one.—*Pacific Record*.

OUR COLORED POPULATION.—There are 7,000,000 negroes in the United States. In the South there are 16,000 colored school teachers. They have colleges, universities and seminaries, and are worth \$2,000,000 in property.

IRON PIPES LINED WITH GLASS.—A process, called the Cooper process, of lining iron pipes with glass, is reported, which is said to have stood the severe test of having water passed through them at the boiling point and immediately followed by water at a temperature of 33 degrees, and without in any way cracking or damaging the glass. If the invention shall prove equal to such changes of temperature in ordinary service without injury, it will be found exceedingly valuable.

ORGANIC POISONS.

PTOMAINES, THEIR CHARACTER, OCCURRENCE AND EFFECTS.

At the fifth annual meeting of the New York State Medical Association, held at Albany in October, the subject of ptomaines, leucomaines, and extractives, was discussed by several of the members. In speaking of the composition of ptomaines, Prof. Elwyn Waller of New York said that the presence of nitrogen, sulphur, and phosphorus had been determined. They were volatile, unstable bodies, some of which could be represented chemically as ammonia, in which more or less hydrogen was replaced by the radical CH_3 , forming dimethylamine, trimethyldiamine, etc. Their action in the case of the poisonous members of the series when taken into the living body resembled that of the pyridic bases. Some produced a rapid dilatation of the pupil and weakening of the nervous centres, others loss of muscular contractility, others loss of cutaneous sensibility, others a slow action of the heart, others convulsions, others somnolence and torpor, and others pallor with profuse flow of the secretions. He thought that the ptomaines of cholera and typhoid had been found beyond much doubt. All ptomaines, leucomaines and extractives were converted albumens. Leucomaines were midway between ptomaines and extractives, without definite boundaries between them. They were divided into groups named uric and creatinic, from resemblances to urea and creatinine respectively. Sixteen were known. All represented progressive changes in albumen. All but one contained oxygen. They had been found in expired air, saliva, blood, brain, urine, pus and the digestive tract. The progressive changes being interfered with so that retention occurred at some intermediate stage, or by-forms arising as a result of the interference, diseases might at once be produced. The neutralization of these products, even where made by bacteria, must, he thought, be more important than the destruction of the micro-organisms. Dr. N. B. Sizer, of Brooklyn, stated that canned meats usually owed their poisonousness to the presence of ptomaines, and not to the action of the soldering fluid used. In one instance canned apricots had contained a poison due to some alteration by decay, and resembling tyrotoxin in its effects. It had killed the child of the nursing mother in a few hours, the mother in forty-three hours, and, after an illness of six days, the father also.—*Science*.

THE DANGER OF TIGHTS.

UNHEALTHFUL COSTUMES WORN ON THE BURLESQUE STAGE.

It may not be generally known that the wearing of tights is a decidedly unhealthy practice. There has never been any scientific principle applied to wearing them properly. They are simply drawn on as tightly as two or four strong arms can get them, and fastened by a leather belt around the waist. This belt has to be drawn at such a tension that what doctors call unhealthy lacing is nothing in comparison with the torture to which women subject themselves in this manner. Articles have recently been written in reference to the wearing of tights in the circus ring, and the bad results that usually follow for the women so employed. But this is nothing compared to the system in vogue in comic opera and burlesque theatres. The circus rider has a ten or fifteen minute act to perform, and she is done for the night. The chorus girl dresses at half-past seven, and knows no relief until after eleven. Louise Montague, the handsome Medora in "Conrad, the Corsair," said not long ago that she did not believe any woman who was not compelled to wear tights would do so. It involved a large expenditure of physical force, and she would be quite willing at any time to

accept \$25 a week less salary if she were not compelled to wear them. As an expert on the question, she added that there was no doubt whatever that women's health was injured by this wearing of tights. Fortunately for herself she had not been compelled to do so for any length of time, but so far as her observation went, women became old before their time by means of these modern requisites of the stage.

WHALE'S MILK.

THE LATEST FAD OF ENGLISH VALETUDINARIANS.

A London correspondent of the *Druggists' Bulletin* writes: "On turning down Oxford Street, my attention was attracted by a huge sign on the opposite side of the street, and also by the number of people flocking into the building. This sign read as follows: 'Whaloid. Infallible cure for Consumption. Dispensing hours, 8 to 10 A.M., 3 to 5 P.M.'"

"Entering the building I was at a loss what to make of the matter, as all I could see was the crowd and a large tank in the centre of the room. This tank was some 70 feet long, 30 feet wide, and as I learned afterward about 30 feet deep, having been constructed at a great expense. While waiting patiently for developments I found that the liquid was being lowered or let out by some means. Soon a smooth black surface appeared to view, and as the water continued to recede I became aware that a captive whale was on exhibition. Surprised at not having to pay any admission fee, I was soon made aware of the reason. A frame-work had been constructed, on which the animal rested, and soon an expert milkman was engaged in extracting for the consumptives, whaloid (or whale's milk) which was greedily absorbed at five shillings per glass. This plan seems to be identical with that of the milkmen in Naples, who lead a cow to the door and deliver the fluid in the presence of the consumer, so that the latter can be satisfied that no illegal dilution is indulged in. I had hardly recovered from my surprise at this unique idea of getting nature's own emulsions when I was to encounter a severer shock. Joining the throng who were leaving, I found myself drifting further down the street toward Southampton Row. The place of attraction proved to be, however, a smaller building, also labelled in a mysterious manner: 'Codloids. Authorized agency protected by letters patent. Supplied to subscribers only. Specific for rheumatism and consumption.'

"Now, what do you suppose codloids proved to be? Why, eggs of the cod-fish, and wonderfully large ones too. They were retailed at two shillings per egg, and eaten raw with a little sodium chloride, which in plain English means salt. I retired that night with the conviction that our native therapeutics and pharmacy were in a very primitive condition, and had been obscured by a large sized 'cloudoid.'"

NOTHING LOST.

WHAT BECOMES OF FOOD WASTE IN PARIS.

The *Revue des Deux Mondes* has some curious statements respecting the food consumption of Paris. In the large lyceums and schools, boys are generally very wasteful; they will throw away half the bread they get for lunch, tread upon it, kick it into the gutter, ink it, etc. None of these fragments are lost. The servants sell them to certain dealers who are called *boulangers en vieux*, and turn their acquisitions to good account. They first pick out all the tolerable pieces, which they heat in an oven and then rasp clean. Thus prepared, these bits re-appear in the market in the shape of toast for soup. Most of the *coûtons* cut into lozenges and served on the tables of the rich, with spinach, have no other origin. As for the dirty crumbs and refuse left after the picking, they are pounded in a mortar and sold to butchers as *chapelure*, with which they cover their outlets and knuckles of

ham. The really filthy remainder, which is too bad even for *chapelure*, is blackened over a fire, pounded, and then mixed up with honey aromatized with a few drops of essence of peppermint. This is sold as an opiate for the toothache.

SANITARY SNOW.

SOME POPULAR MAXIMS ON THE VALUE OF SNOW TO HEALTH.

1. A snow year; a rich year.
2. In March much snow, to plants and trees much woe.
3. Snow for a se'n'ight is a mother to the earth, forever after a stepmother.
4. Snow is the poor man's fertilizer.
5. The more snow the more healthy the season.
6. What lay hidden under the snow comes to light at last.
7. When in the ditch the snow doth lie,
'Tis waiting for more by and by.
8. When the snow falls dry it means to lie;
But flakes light and soft bring rain oft.
9. Whether you boil snow or pound it, you will have but water from it.

BOGUS EGGS.

A DOUBTFUL STORY FROM THE REGION OF NATURAL GAS.

Artificial eggs have been sold in the Pittsburgh market and offered to the public in the place of real ones. A woman walked into the office of the Board of Health on Seventh Street, in that city, with a basket containing four dozen eggs.

"All these eggs are manufactured and not a single one has been laid by a hen," the woman exclaimed to one of the health officers. "What am I to do about the matter?" she then asked.

The gentleman picked up one of the eggs, looked at it, and he then gazed at the woman in astonishment, saying:

"What is wrong with the eggs? They look all right, and I don't see any difference between them and any other eggs. You mean to state that they are manufactured? They may be rotten, but I don't think that this egg was made by the mere ingenuity of any human mind."

"Well, then, you are just a little mistaken, that is all," said the woman, "and I will prove it to you. Look here, now, at this egg."

She then took one of them from the basket and broke it, and when the officers observed the yolk their faces bore the evidence of unmistakable wonder.

In shape the yolk was similar to that of a real egg, but its color differed somewhat from that article, being darker and of a browner tint than that in the ordinary egg. Besides that, however, the yolk of the false egg consisted of a more jelly-like substance.

Its composition appeared to contain gelatine, syrup and starch. The white of this manufactured article looks exactly like the white of the real egg. It had the same transparent appearance, and the imitation seemed to be perfect.

But the most puzzling thing is the shell. There is no difference noticeable to the eye at all, and it is not wonderful that any one should buy such an egg as real hen fruit.

The entire article, outside of the yolk, is a perfect counterpart of anything we see in the real egg. The woman bought them in the market at thirty cents a dozen.—*Pittsburgh Dispatch*.

DOMESTIC DIETETICS.

SPECIALLY PREPARED, FROM PRACTICAL TESTS, FOR THE
LADY READERS OF THE "AMERICAN ANALYST."

SEASONABLE FOOD.

January.

MEATS.—Beef, mutton, ham, kidneys, liver, venison, sausage, pork.

GAME AND POULTRY.—Grouse, hare, pigeon, quail, chicken, duck, turkey, rabbit, goose.

FISH.—Bream, cod, crabs, eels, carp, flounder, halibut, herring, lobster, mackerel, mussels, oysters, perch, pike, rock-fish, salmon, smelt, whitefish.

VEGETABLES.—Artichokes, beets, beans, cabbage, carrots, cauliflower, celery, garlic, lettuce, onions, parsley, parsnips, potatoes, shallots, spinach, squash, tomatoes, turnips.

FRUIT.—Apples, bananas, grapes, oranges.

PRACTICAL RECIPES.

CHOWDER.—Fry some slices cut from the fat part of pork, in a deep stewpan; mix sliced onions with a variety of sweet herbs, and lay them on the pork; bone and cut a fresh cod into thick slices, and place them on the pork; then put a layer of slices of pork, on that a layer of hard biscuit or crackers, then alternately the pork, fish and crackers, with the onions and herbs scattered through them till the pan is nearly full; season, pepper and salt; put in about two quarts of water, cover the stewpan close, and let it stand with fire above and below it four hours; then skim it well and serve it.

MACARONI, TOMATOES AND CHEESE.—Cook the macaroni till tender; make a sauce of ripe tomatoes seasoned with pepper and salt, grate some cheese; have ready a hot dish, put in a layer of macaroni, next sprinkle with cheese, then add a layer of the tomato sauce. Serve at once.

HALIBUT COLLOPED.—Cut the fish into nice cutlets of about an inch thick, and fry them; then put them into a broth made of the bones, four onions, a stick of celery and a bundle of sweet herbs, boiled together for one half an hour.

MUSHROOM CATSUP.—Mushroom juice, two gallons; allspice, two ounces; cloves, one ounce; black pepper, one ounce; mustard seed, one ounce; ginger, one ounce; salt, one pound; shallots, two ounces. Bruise all the spices, simmer all the ingredients for one hour in a covered vessel, cool, strain and bottle.

DELANO PUDDING.—One large cupful of chopped suet; three teacupfuls of flour, in which two heaping teaspoonfuls of Horsford's baking powder has been sifted; one teacupful of raisins; one teacupful of citron, currents and orange peel mixed; one and a half teaspoonfuls cinnamon; one teaspoonful cloves; one cupful milk; one cupful molasses. Mix dry ingredients together, add milk and molasses, stir well, steam for three hours and serve with hard sauce.

GINGER COOKIES.—Take one pint of molasses, one teacupful of butter, one spoonful of ginger, and one teaspoonful of salaratus, and boil all the ingredients thoroughly; when nearly cold, add as much flour as can be rolled into the mixture.

APPLE JELLY.—Pare and core five dozen of pippins, put them in a pan with enough water to cover them, let them boil gently until soft; let them cool, then strain them through a jelly-bag, put the juice in your preserving pan, and to each pint of juice put one pound of fine sugar and the peel of two lemons, then boil it until reduced to the stiffness of calf's-foot jelly, skim it well, and add the juice of a lemon; if you cannot get the pippin, any acid apple will do.

RUSSIAN SIGNS.

HOW THE CZAR'S TRADESMEN EXPLAIN THEMSELVES BY
SIGN LANGUAGE.

Mr. Stead, in an entertaining article in the *Contemporary Review* on Russia, says: "In Holland and Belgium the names of the railway stations are given in three or four different languages. In Berlin and Paris there is more consideration shown for foreigners than in St. Petersburg. The Russian thinks that in Russia Russian suffices as a means of communication. Fortunately in his shop fronts he mercifully interprets his Cyrillian characters by that original Volapuk of the world's infancy, the picture. The use of signs, once universal in England in an age when few save the priests could read and write, is now confined with us almost exclusively to the public-house. In Russia, the number of literates being still small in proportion to the population, the tradesman has recourse, not to signs, but to the simple and obvious expedient of painting upon the outside walls of his establishment more or less vivid pictures for all the articles which he has on sale. The butcher's front is covered with frescoes of legs of mutton and sirloins of beef. The green grocer glows resplendent behind a wall full of painted cabbages, carrots and turnips. Tempting pictures of the warmest of fur overcoats proclaim the dealer in winter wraps. Some of these mural advertisements are wretched daubs, as bad as our signboards, but others are very fairly executed; and, considering the difficulty of the subject and the stucco on which the artist has to work, the result is not unsatisfactory. The effect of the whole is to give much more variety and color to the streets of St. Petersburg than we can boast in Western capitals.

PRUDENT FORESIGHT.

THE DEALER DIDN'T WANT IT MADE TOO GOOD.

An inventor recently perfected a discovery, for which he has been working during a number of years. It is India-rubber in a state of solution, in the preparation of which no sulphur, ether or naphtha is employed. He applied it to a number of materials to demonstrate its varied and great usefulness, among them to a piece of black silk. A friend introduced him to a leading silk importer, who sent for his chief expert to examine the piece of material treated. After a very careful examination the expert said:

"This increases the lustre of the silk?"

"Yes," assented the inventor.

"Increases its body?"

"Yes, yes."

"Renders it thoroughly waterproof, while the rubber is not discernible?"

"Just so."

"And vastly increases the durability?"

"Exactly so. Just the four things that I claim. I'm delighted that you recognize them."

"And nothing is further from our wishes than to see such a thing introduced. We want silk to wear out, not made to last forever."

The merchant endorsed that view, and politely bowed the inventor out.

CITY STABLE NUISANCES.

BROMINE MAY SOLVE THE PROBLEM TO THE PUBLIC
SATISFACTION.

President Bayles, of the Health Board, last week issued a notice to the effect that as stable-owners had found that bromine solution corrected all causes of offence by absorbing ammonia, so that everything in a stable, including manure, bedding, and even saturated floor boards were rendered immediately inodorous, a

large quantity of bromine solution had been prepared at the disinfecting house in East Sixteenth Street. This would be given in five or ten gallon quantities to those who wished it for experimental use. Bromine being a material which cannot be safely handled in large volume, an effort will be made to induce the manufacturing chemists to put it up in half-ounce and ounce packages, which will respectively saturate five and ten gallons of water. These small packages, glass encased, are to be dropped into the water without unsealing, and broken as they lie in the bottom of the vessel by an iron rod.

A FATAL DRINK.—The "ginger beer bottle" seems to be very fatal to Englishmen who drink ammonia from it for pop, and declare that the blarsted stuff tastes queer.

WARMING CLARET.—Red wines should always be taken out of the cellar and kept in the kitchen some hours before they are drunk. They should never be placed before the fire, but allowed to become warm gradually.

OLD BUT GOOD.—Doctor (passing a stonecutter's yard)—"Good-morning, Mr. Jones. Hard at work, I see. I suppose you finish your gravestones as far as 'In Memory of' and then wait for someone to die, eh?" Stonecutter—"Why, yes; unless somebody's sick and your doctoring 'em; then I keep right on."

HOW HE WAS TO TAKE THE MEDICINE.—An absent-minded doctor, who had considerable investments in real estate, was about leaving a patient after writing a prescription, when he was asked for directions as to how the medicine was to be taken. "Oh, yes," he said, "I forgot. One-third down and the balance in one and two years."

BACTERIA.—"Bacteria" is a word in the plural number. It is applied to one of the lowest forms of vegetable life. The thing may be poisonous or not, according to the conditions. Bacterium is a chemical, not a medical term, though the physicians have got hold of it along with that modern doctrine known as the germ theory of disease.

GERMAN BEER GLASSES.—Each Berlin beer glass must bear the standard pint mark upon the side, showing where the top of the beer and the bottom of the foam must meet. Often a German will look at his glass and sarcastically inquire, "Is this a glass of beer?" Without a word the mug is filled to the proper line. This is just the way they do it at Coney Island.

EDUCATED APPRENTICE.—Boy to druggist: Want a boy?

Druggist: Yes. Ever worked in a drug store?

Boy: Yes, sir.

Druggist: What did you do?

Boy: Bit holes in porous plasters.

Rapid exit of boy, followed by a bottle of mucilage.

CHINESE DUCKS.—It is stated that there are more ducks in China than in all the world outside of it. They are kept on every farm, on the private roads, and on all the lakes, rivers and smaller streams. There are many boats on each of which as many as 2,000 are kept. Their eggs constitute one of the most important articles of food. They are hatched in establishments fitted up for the purpose. Some of them turn out as many as 50,000 young ducks every year. Salted and smoked ducks are sold in all the towns, and many of them are exported to countries where Chinamen reside.

DEPTH OF THE OCEAN.—The greatest known depth of the ocean is midway between the Island of Tristan d'Acunha and the mouth of the Rio de la Plata. The bottom was there reached at a depth of 40,236 feet, or eight and three-fourth miles, exceeding by more than 17,000 feet the height of Mount Everest, the loftiest mountain in the world. In North Atlantic Ocean, south of Newfoundland, soundings have been made to a depth of 4,580 fathoms, or 27,480 feet, while depths equaling 34,000 feet, or six and one-half miles, are reported south of the Bermuda Islands. The average depth of the Pacific Ocean between Japan and California is a little over 2,000 fathoms; between Chili and the Sandwich Islands 2,500 fathoms, and between Chili and New Zealand 1,500 fathoms. The average depth of all the oceans is from 2,000 to 2,500 fathoms.

A SURE SIGN.—"What an intellectual couple Mr. and Mrs. Cranque are!" "Intellectual? What makes you think so?" "Why, Mrs. Cranque cuts her hair short, and Mr. Cranque lets his grow long."—*Harper's Bazar*.

NO ADULTERATION THERE.—Servant girl (from the country): Mister, I never find any cream in this milk of yours. Milkman (highly pleased): No, young woman, I never adulterate my milk with anything.—*Chicago Tribune*.

STRONG!—"This butter, Mr. Spicer," said the dealer, "carried off the prize at the farmer's fair," and Seth spat out a taste of the compound and remarked: "Unless the prize was a ship's anchor and chain cable, I would think the butter could have carried it off easily."—*Grocers' Advocate*.

BUSINESS NOTES.

TWIN COMFORTS.

Two essentials for sound and beautiful teeth are now supplied by the Horsey Manufacturing Company, of Utica, and may be found on sale at every druggist. They are the Ideal Felt Tooth Polisher, a perfect polisher of the enamel, a gentle stimulant to the gums, and a thorough cleanser of the teeth. It avoids all the well-known irritation, discomforts and injuries of bristles. A blessing to adults. A delight to children. More economical, more cleanly than harsh bristles. The other is what a noted authority describes as "the con-

necting link which makes our system a perfect prevention of decay." It was invented by Dr. B. T. Mason, President of the Fifth District Dental Society of New York State. It combines the best imported quill and the finest floss silk at the slight expense of ten cents for a case containing six tooth picks. Each holds a spool of one yard of floss silk, which is so earnestly advised by every dentist to be used between the teeth after eating, to promote comfort and prevent decay. The prices of these are remarkably low.

YELLOW FEVER.

JACKSONVILLE, FLA., Sept. 26, 1888.

I believe I have prescribed over one hundred bottles of Malted Milk for yellow fever patients during the present epidemic. Children and adults find it just the food needed for their diseased and delicate stomachs. Often I have found it retained on the stomach when everything else was rejected. Will write you more fully after the epidemic is over. I am treating from thirty to sixty patients daily. Yours truly,

GEO. F. CENTER, M. D.,
43 Julia Street.

To Malted Milk Co., Racine, Wis.

A NEW BRAND OF SOUPS.

Armour & Co., the Chicago packers, invite attention to their packing of extra quality soups, in red lacquered one and two-pound cans. They are prepared under the direction of an experienced "chef," and are equal to the finest soups served in the best clubs, hotels, restaurants or private houses. They will stand at least an equal quantity of water. These statements are made by Armour & Co., which is a sufficient guarantee of their reliability.

BUFFALO LITHIA WATER

In the Uric Acid Diathesis, Bright's Disease, Chronic Inflammation of the Bladder, etc.

JAMES L. CABELL, M. D., A. M., LL. D., Professor of Physiology and Surgery in the Medical Department in the University of Virginia, and President of the National Board of Health.

"The Water of Buffalo Spring No. 2 contains in notable quantities two of the ALKALIES which are accredited as extremely valuable in the treatment of GOUT, LITHIASIS, and Liver Affections. I refer to the CARBONATES of POTASH and LITHIA.

"I have recently read with interest a paper in 'The New York Medical Journal' on the Buffalo Lithia Water in Diseases of the NERVOUS SYSTEM, in which the writer, Dr. Boyland, citing his own observations and those of other eminent physicians, ascribes to this water a special virtue as a direct tonic for the NERVOUS SYSTEM in cases of CEREBRAL exhaustion. I have only had occasion to test its effects in this direction in cases in which the NERVOUS SYMPTOMS may have been due to LITHAEMIC conditions. In these cases the relief following the use of the remedy was very decided."

Dr. WM. A. HAMMOND, of New York, Surgeon-General U. S. Army (retired), Professor of Diseases of the Mind and Nervous System in the University of New York, etc.

"I have for some time made use of the Buffalo Lithia Water in cases of affections of the NERVOUS SYSTEM, complicated with BRIGHT'S DISEASE OF THE KIDNEYS or with a GOUTY DIATHESIS. The results have been eminently satisfactory. Lithia has for many years been a favorite remedy with me in like cases, but the BUFFALO WATER CERTAINLY ACTS BETTER THAN ANY EXTEMPORANEOUS SOLUTION OF THE LITHIA SALTS, and is, moreover, better borne by the Stomach. I also often prescribe it in those cases of CEREBRAL HYPERAEMIA resulting from over-mental work—in which the condition called NERVOUS DYSPEPSIA EXISTS—and generally with marked benefit."

Dr. ROBERT BATTEY, of Georgia, SUGGESTOR OF BATTEY'S OPERATION.

"I would state that I have been using the Buffalo Lithia Water, No. 2, in my practice for three years past, in cases of CHRONIC INFLAMMATION of the BLADDER, whether induced by STONE, by enlarged PROSTATE in the aged or by NEGLECTED GONORRHOEA, AND HAVE SECURED EXCELLENT RESULTS, which encourages me to prescribe it for the future."

HUNTER McGUIRE, M. D., LL. D., late Professor of Surgery, Medical College of Virginia, Richmond.

"BUFFALO LITHIA WATER, Spring No. 2, as an ALKALINE DIURETIC, is invaluable. In URIC ACID GRAVEL, and, indeed, in diseases generally dependent upon a URIC

ACID DIATHESIS, it is a remedy of extraordinary potency. I have prescribed it in cases of RHEUMATIC GOUT, which had resisted the ordinary remedies, with wonderfully good results. I have used it also in my own case, being a great sufferer from this malady, and have derived more benefit from it than from any other remedy."

Dr. WM. B. TOWLES, Professor of Anatomy and Materia Medica in the Medical Department of the University of Virginia.

"BUFFALO LITHIA WATER, No. 2, belongs to the ALKALINE or, perhaps, to the ALKALINE-SALINE Class, for it has proved far more efficacious in many diseased conditions than any of the simple ALKALINE waters.

"I feel no hesitancy whatever in saying that in GOUT, RHEUMATIC GOUT, RHEUMATISM, STONE in the BLADDER, and in all Diseases of URIC ACID DIATHESIS, I know of no remedy at all comparable to it.

"Its effects are marked in causing a disappearance of ALBUMEN from the urine. In a single case of BRIGHT'S DISEASE OF THE KIDNEYS I witnessed decided beneficial results from its use, and from its action in this case I should have great confidence in it as a remedy in certain stages of the disease."

Dr. THOMAS H. BUCKLER, of Paris (formerly of Baltimore), SUGGESTOR OF LITHIA as a Solvent for Uric Acid.

"Nothing I could say would add to the WELL-KNOWN REPUTATION OF THE BUFFALO LITHIA WATER. I HAVE FREQUENTLY USED IT WITH GOOD RESULTS IN URIC ACID DIATHESIS, RHEUMATISM, AND GOUT, and with this object I have ordered it to Europe, from Coleman & Rogers, of Baltimore. Lithia is in no form so valuable as where it exists in the Carbonate (the form in which it is found in the BUFFALO LITHIA WATER), Nature's mode of solution and division in water which has passed through Lepidolite and Spondumline Mineral formation."

Dr. GRAEME M. HAMMOND, of New York, Professor of Diseases of the Mind and Nervous System in the New York Post-Graduate Medical School and Hospital.

"In all cases of BRIGHT'S DISEASE of the KIDNEYS I have found BUFFALO LITHIA WATER of the greatest service in increasing the quantity of urine and in eliminating the ALBUMEN. In certain cases of Melancholia, accompanied by excessive eliminations of URATES and URIC ACID, it is often the only remedy necessary. In GOUT and RHEUMATISM it is highly beneficial, and in many cases of Impotence its restorative qualities have been of undoubted assistance. I have long regarded BUFFALO LITHIA WATER as the most valuable mineral water in use."

Water in cases of one dozen half-gallon bottles, \$5.00 per case at the Springs.

THOMAS F. GOODE, Proprietor, Buffalo Lithia Springs, Virginia.

BOVININE, BUSH'S FLUID + FOOD,

Is the ORIGINAL and ONLY preparation of RAW FOOD that does not become putrid and disgusting in a short time.

A MOST WONDERFUL NUTRIENT.

The vital principles of Beef and Mutton concentrated. A highly condensed Raw Food Extract. Acceptable to the most delicate taste and smell. Retained by delicate stomachs that reject all other foods. It assimilates more readily than any other food known to the medical profession. Bovinine under the microscope shows the blood corpuscles in their normal condition strongly marked, while in other foods or extracts this vitally important element is destroyed by the action of heat in cooking.

Containing 26.58 Per Cent. of Soluble Albuminoids,

According to OSCAR OLDBERG, Ph.D., Professor of Chemistry and Toxicology, and Dean of the North-Western College of Pharmacy.

A. L. LOOMIS, M. D., Professor in Medical Department of University of New York, says: "I prescribe Bush's Fluid Food or BOVININE, and prefer it to similar preparations."

J. S. JEWELL, M. D., Chicago, says of Bovinine: "I am delighted with it; it is what I have been looking for these twenty years, and it supplies a want that nothing else has been able to fill."

DRS. WARD and FRED. SMITH, speaking for themselves and their colleagues of the Hospital of St. Barnabas, Newark, say: "Bovinine was readily taken by the patients, was easily retained, and in many cases by stomachs which had rejected all other forms of nourishment. We believe Bovinine contains more nutriment, relative to the bulk, than any other preparation known to the medical profession."

"During the last four months of his sickness, the principal food of my father, General Grant, was Bovinine and Milk; and it was the use of this incomparable food alone that enabled him to finish the second volume of his personal memoirs.—FRED. D. GRANT."

October 1st, 1885.

Carefully prepared from the formula of the late James P. Bush, by the J. P. Bush Manufacturing Co., 44 Third Avenue, Chicago, Ill.

PUT UP IN 6 AND 12 OUNCE SIZES, AT 60c. AND \$1.00 PER BOTTLE.

For Sale by all Druggists.

Principal Office, 2 BARCLAY STREET, NEW YORK CITY.

KEITH'S CON. TINC. AVENA SATIVA

(FROM COMMON OATS.)

WITHOUT ADMIXTURE OF ANY KIND.

A Powerful Nerve Stimulant, Tonic, Etc.

WAS FIRST offered to the medical profession by B. KEITH & Co., in 1881, as a remedy to be employed in the treatment of

Paralysis, Epilepsy, St. Vitus' Dance, the Morphia or Opium Habit, Chloral and Tobacco

Habits, Sleeplessness, Nervous Debility and Exhaustion, Neuralgia, Alcoholism

Painful and Deficient Menstruation,
Headache, Hysteria, Impotency,
Convulsions and Prostration
from fainting, and in the
Convalescent stage of
all Acute Diseases.

DOSE.—From ten to thirty drops, or more, as often as may be indicated to meet the urgency of the case. Administer in hot water when quick action is desired.

AN OVERDOSE CAUSES PAIN AT BASE OF BRAIN.

—WE MAKE ONE QUALITY ONLY.—

Price,

3 oz., 45c.; 4 oz., 75c.; 8 oz., \$1.35; 16 oz., \$2.50

MALTINE

MALTINE is far superior in nutritive and diastatic value to any Malt Extract manufactured in the World. There is no reconstructive that excels Maltine in Phthisis and many wasting Diseases.

MALTINE in its different forms is the only malt preparation we now employ, being so palatable, digestible, and easily assimilated. Of its efficiency in appropriate cases there is no more doubt in our minds than there is of the curative power of Quinine, Cod Liver Oil, the Bromides, and the Iodides. It deserves to stand in the front rank of reconstructives, and the reconstructives by their preventive, corrective, and curative power are probably the most widely useful therapeutical agents that we possess. PROF. L. P. YANDELL.

MALTINE is a valuable food, a food of priceless value at times of emergency. In fact, in very grave gastric cases it is a food which may be often resorted to when at one's wits end what to do. J. MILNER FOTHERGILL.

Out of 14 trade samples of Malt Extract examined by Messrs. Dunstan & Dimmock, only three possessed the power of acting on starch. These brands were MALTINE, Corbyn, Stacey & Co.'s Extract, and Keppel's Malt Extract. WILLIAM ROBERTS, M.D., F.R.S.

I have subjected "Maltine" and all other leading "Extracts of Malt" to an exact quantitative comparison of their diastatic activity. The results demonstrate conclusively the far greater diastatic value of Maltine, and enable me to state, without any qualification whatever, that it far exceeds in diastatic power any of the six preparations of Malt which I have examined. R. H. GRITTENDEN.
Professor of Physiological Chemistry in Yale College.

At the International Health Exhibition held in London, England, the only gold medal and the highest award of merit were given to Maltine by a Jury composed of the best chemists in Europe, and recent analyses made by the most reliable authorities in Europe and America prove conclusively that Maltine—in nutritive and diastatic value—is superior to all other malt preparations now in the market.

NOTE.—Physicians will observe that Maltine, as now prepared, is not so viscid as formerly made, being of a more fluid consistency; and, while retaining the nutritive and diastatic value which has given it precedence over all other Extracts of Malt, it is rendered entirely agreeable to the taste of the most fastidious, and is more easily administered. As now prepared, we positively guarantee that Maltine will not ferment or congeal in any climate or at any season of the year.

COMPLETE LIST OF MALTINE PREPARATIONS.

MALTINE (Plain).	MALTINE with Phosphates, Iron
MALTINE with Alkalies.	Quinine, and Strychnia.
MALTINE with Cod Liver Oil.	MALTINE Ferrated.
MALTINE with Hypophosphites.	MALTO-YERBINE.
MALTINE with Peptones.	MALTO-VIBURNIN.
MALTINE with Pepsin and Pancreatine.	MALTINE with Ocasara-Segrada.

Physicians may obtain Maltine from all druggists in every part of the world. In cases where the physician intends to prescribe Maltine, the word "Maltine" should be written, and not simply the words "Malt Extract," or "Extract of Malt."

Send for Pamphlet giving comparative analyses by 100 of the best Analytical Chemists in this country and Europe. We will be happy to supply any regular practitioner with eight ounces each of any three Maltine compounds that may be selected from our list, providing he will agree to pay express charges on same.

CONGRESS AND PURE FOOD.

The recent report of the Commissioner of Agriculture on food adulterations, which was referred to at length in our issue of January 3d, has naturally attracted considerable attention at the hands of the press throughout the country. One contemporary believes the evidence confirms the statement that adulteration is widely practised on account of the cheapness of substitutes almost identical with the genuine article, and that the trade in these adulterated goods would be legitimate and proper, and probably very large, if carried on under truthful representations. This view has been maintained for several years by the AMERICAN ANALYST in opposition to the sensational and senseless denunciations in which a greater portion of the subsidized trade press has indulged. In another place we read, in reference to the attempts to extort blind legislation from Congress: "The Commissioner's report strengthens the position taken by those who resist selfish class legislation designed to tax one class of products for the benefit of another, and who insist upon Federal and State pure food legislation, under which the adulterated and unadulterated articles may compete for popular favor

under truthful representations as to their composition. The advocates of narrower legislation should perceive that Congress has shown its disinclination to adopt their views, and that if action is to be obtained it must be by a concerted effort in favor of a fair and comprehensive measure."

PEPTONES.

What are peptones? The *Schweizer Wochenschrift* has a very instructive article on this subject, from which we condense the following: Peptones are transformed albumenoid matter, the product of digestion. Digestion causes albumenoids to lose their coagulating power, and prevents their being precipitated by certain chemical reagents. The composition of peptones is similar to the matter from which they have been formed. Poehl says that peptone is the highest state of albumen. Another chemist believes the peptone of milk to be a solution of albumen in lactic acid; and as regards peptones generically, a solution of protein in lactic acid. Peptones, as most generally found in the stomach, consist of muriatic as well as lactic acid: in fact, peptones may be considered as a solution of protein in acid.

DANGEROUS FOOD PRESERVATIVES.

The French Committee on Hygiene has lately brought the dangerous nature of some food preservatives into prominence. It has been well established that digestion is only a form of decomposition produced by certain minute organisms which also produce the other form of decomposition which we call decay. It must be therefore evident that any substance which has the power of arresting decay may seriously interfere with the normal process of digestion. Hence, it is important that in investigating the character of a food preservative we should look further than as to its absolute freedom from what we call poisonous properties. On these principles the use of benzoic acid has been prohibited in France. For the same reasons salicylic and boric acids and the new antiseptic hydronaphthol have been prohibited. The greatest caution should be exercised in the employment of food preservatives, and until absolute safety can be guaranteed it would be as well to stick to the old process of Pasteurizing, which consists simply in exposing foods to such a temperature as will destroy germs.

WHO SELLS CHICAGO BEEF?

The foregoing is a question which is frequently asked without eliciting any answer. We all know that a large quantity of dressed beef from Chicago is delivered daily at all important railroad points, but the consumer does not feel sure whether the Chicago beef ever reaches his table. The retail butcher, falsely instructed by the wholesaler and the dressers of worn-out cows, miniature steers or worked down oxen, has for years felt it to be

his interest to decry Chicago beef, repeat all the sensational falsehoods he has learned about it, and when asked if he sells it held up his hands in holy horror that he should sell the beef he has so loudly decried. The truth, however, is that nearly every retail butcher having a first-class family trade to supply has had to sell Chicago beef, because it was the kind of meat that was the most tender and healthy-looking, and the only kind any sensible housewife would buy after she had once tried it. Many a juicy Chicago roast has been placed on the table with the well-meant but entirely erroneous comment, "What beautiful meat we are getting. We don't need to buy Chicago beef." The truth is that in most cases the best meat exposed in the butchers' stalls comes from Chicago, and the sooner the retail butchers realize that their customers prefer the superior Chicago beef under its right name the better they will get along.

THE SUN'S ATMOSPHERE.

The eminent astronomer, M. Janssen, says the *Boston Science News*, has been investigating the question of the existence of oxygen in the sun's atmosphere. The question to be decided was, whether the oxygen lines in the solar spectrum were due to the earth's atmosphere, or were really caused by the presence of that element in the sun. He ascended to the Grand Mulets on Mont Blanc, and at an elevation of 9,000 feet, where the air was comparatively rarefied and nearly free from aqueous vapor, found that the oxygen lines were almost entirely absent from the solar spectrum. Hence he infers that these groups would entirely disappear from the spectrum if it could be observed at the limits of the earth's atmosphere, and the rays and bands due to oxygen which we find in the spectrum are exclusively due to the earth's atmosphere. We are not, however, entitled to assume the absence of oxygen in the sun. We can merely say that oxygen does not exist in the sun's atmosphere in a condition capable of producing the spectral manifestations which it gives to the earth's atmosphere.

A WORD-COUNTER.

A telegraph operator in Minneapolis has invented a word-counting machine which may be used by itself or attached to a type-writer. It is much the same as a pedometer, only more accurate. It is as large as a small clock. The works are inside the nickel case, on one side of which is the face. The machine will count up to 2,500 words, and can be used for any number by keeping tally of the number of times it passes the 2,500 mark. There are two hands like the hour and second hand of a watch. Every time a word on the type-writer is finished the same motion which spaces for the word registers on the word-counter. When the second hand counts up to twenty-five words the large hand moves forward a quarter of a space. The face is divided into twenty-five spaces, one for each hundred words,

and a glance at it shows at once how many words have been written. The use of the word-counter is not limited to type-writing machines, but it can be used in writing and in dictation by keeping it at hand and making a slight pressure at the end of each word. Some operators attach it to their desks and work it with a string fastened to their feet. It is a useful invention, especially in telegraphy, and in making a written article of a specified length.

THE PURE FOOD FIZZLE.

Our esteemed contemporary, *The Retail Grocer's Advocate*, at length throws up the sponge on the subject of a National Food Law. The theme is suggestive, but we reserve comment. The *Advocate* says:

"It cannot be possible to ever accomplish much in the way of an organized effort at national organization in anything. That was why the committee so reported to the last convention. A national convention is all that should be attempted. Two such have been held in favor of a National Food Law, but nothing can be accomplished by holding any more such exhibitions. They do more harm than good. The trade press may as well abandon all attempts at accomplishing anything outside of educating the grocer to handle pure goods as fast as the consumer can be educated to pay for them. That work is steadily going on. Everything else is standing still in the pure food movement. An appropriate obituary notice of it is now about all that is in order."

SUGAR REFINING.

HOW THE PROCESS IS PERFORMED—WITHOUT ELECTRICITY.

In view of the recent collapse of the fraudulent electrical process for refining sugar, the following description of the genuine process from the *Popular Science News* will have timely interest:

"Sugar is a peculiar product of many different species of plants, but the greater part of that consumed is obtained from the sugar-cane and beet root. It has been known in the East Indies and China from a very remote period, but has only been generally used in Europe and America since the beginning of the eighteenth century. Previous to that time it was an expensive luxury instead of the cheap necessity of life which it has now become. Beet sugar is extensively used in Europe, the cultivation of the root being stimulated by the governments, but in this country the supply is principally obtained from the sugar-cane plantations of the Southern States and the West Indies. The sugar-cane belongs to the family of grasses, and contains about eighteen per cent. of pure sugar, although not more than one-half of this can be actually realized. The canes are crushed between rollers, and the expressed juice boiled down to the proper point and allowed to cool and crystallize. The moist, impure, dark-colored mass of crystals obtained by this process, is known as raw sugar and is shipped to the refineries, while the liquid which drains off is known as molasses, and consists of a mixture of cane-sugar, inverted sugar, caramel, etc., with a liberal admixture of "extraneous matter," that is, dirt. The process of refining the raw sugar and converting it into the white, brilliant, and chemically pure crystals of granulated or loaf sugar, is an interesting one. The raw sugar is dissolved in water, strained to remove the coarser impurities and pumped into large tanks, where a quantity of albumen, usually in the form of ox blood, is added, and the mixture heated until the albumen coagulates or becomes solid. In so doing it separates out the impurities which, entangled in the mass of albumen, rise to the top of the liquid as a thick scum which is pressed dry and solid as a fertilizer. This process is exactly analogous to the "clearing" of coffee with the white of an egg, the only difference being in the source from which the albumen is derived. The solution of sugar is now perfectly clear

BURNETT'S PERFECTLY Standard PURE Flavoring HIGHLY CONCENTRATED EXTRACTS

and pure, but is still of a dark color, which must be removed. This is done by filtering it through long iron vessels filled with bone-black or charred bones coarsely ground. This bleaching property of bone-black is not very well understood, but is a most valuable quality in many other arts besides that of sugar refining. The impurities are doubtless attracted and held by the pores of the bone-black, as it loses the property after a while and must be burned over again to restore its power. We now have a clear, colorless solution, consisting principally of saccharose or crystallizable sugar, with varying amounts of inverted or uncrystallizable sugar. It is only necessary to concentrate it by boiling and allow the sugar to crystallize out. If, however, this is done in an open pan under the ordinary pressure of the air, boiling will only take place at a temperature sufficiently high to "burn" the sugar and form caramel and other undesirable substances. The evaporation therefore takes place in a vacuum pan, an air-tight hollow vessel heated by a steam coil and from which the air and water-vapor are exhausted by a powerful pump. According to the well-known principle that the boiling point of a liquid is lowered as the pressure upon it diminishes, the clear syrup boils at a sufficiently low temperature—from 114 degs. to 150 degs.—to prevent the alteration of decomposition of the sugar. This process of evaporation requires great experience, and only a thoroughly skillful workman can obtain a complete and uniformly crystallized product. After the concentration has reached the proper point, the syrup is drawn off and allowed to crystallize, forming granulated sugar. The mother-liquor or syrup is drained from the crystals and boiled over again and a fresh crop of crystals obtained, and this process is repeated several times. These products are of inferior quality and are sold under various names as "coffee crushed," and "brown" sugars. There is a popular opinion that these sugars are sweeter than the more refined article, but this is a mistake, and they are really less economical to purchase, as they contain more or less moisture and glucose for which a comparatively high price is paid. The crystals of granulated sugar are dried without heat by a most ingenious machine known as the centrifugal drier. It is a cylindrical vessel with finely perforated sides, which is filled with the moist sugar and rotated with great velocity. The water is thrown off through the sides by the centrifugal force, leaving the sugar almost dry, a simple exposure to warm air only being needed to complete the process, and it is then ready to be sifted into barrels and sold in the market. Loaf sugar is refined in the same way, but the concentrated syrup is allowed to crystallize in conical molds, so that it hardens into a solid mass which is afterwards cut up into lumps. Rock-candy is sugar which has been allowed to crystallize slowly so as to form large crystals. Granulated sugar is one of the purest articles of food produced. It is rarely or never adulterated, the characteristic form of its crystals rendering any foreign admixture evident upon simple inspection."

THE TONGUE.—A white tongue is said to denote a febrile disturbance; a brown, moist tongue, indigestion; a brown, dry tongue, depression, blood poisoning, typhoid fever; a red, moist tongue, inflammatory fever; a red, glazed tongue, general fever, loss of digestion; a tremulous, moist and flabby tongue, feebleness, nervousness.

THE superiority of these Extracts consists in their PERFECT PURITY AND GREAT STRENGTH.

There is no subject which should more engross attention than the purity of the preparations which are used in flavoring the various compounds prepared for the human stomach.

They are not only true to their names, but are prepared from fruits of the best quality, and so highly concentrated that a small quantity only need be used.

JOSEPH BURNETT & CO., Boston, Mass.

STEVENSVILLE MILLS.

IMPEROYAL VACUUM COOKED OATS. IMPEROYAL VACUUM COOKED WHEAT.

Adapted to all kinds of Pastry, Bread, Biscuit, Griddle Cakes, etc., and its absolute purity and freedom from Alum, Terra Alba or any injurious ingredient, makes it a necessity in every household. No lady can afford to be without it. Sold by best Grocers.

M. D. STEVENS,
Room 18, Mercantile Exchange,
Cor. Hudson & Harrison Sts., NEW YORK.

A NEW ORNAMENT.—A new Parisian industry is the manufacture of hoar frost glass, which is covered with feathery patterns resembling those naturally produced upon window panes in cold weather. The glass is first given a ground surface, either by the sand-blast or the ordinary method, and is then coated with soft varnish. The varnish contracts strongly in drying, taking with it the particles of glass to which it adheres, and this reproduces very accurately the branching crystal of frost-work. A single coat gives a delicate effect, and several coats yield a bold design.

PIANOS AND PLANTS.—A piano tuner who says that pianos frequently deteriorate because they are allowed to become too dry, prescribes this remedy: "Keep a growing plant in the room, and so long as your plant thrives your piano ought to, or else there's something wrong with it. Just try it, and see how much more water you'll have to put in the flower-pot in the room where your piano is than in any other room. Some people keep a huge vase or urn with a sopping-wet sponge in it, near or under the piano, and keep it moistened just as a cigar dealer keeps his stock. They keep this up all the time the fires are on."

A GLUTTONOUS WAGER.

EATING ONE HUNDRED DOLLARS WORTH AT A SINGLE MEAL.

Some few gentlemen happened to be dining a few weeks ago at the fashionable restaurant, the Café de Paris, and one of them asserted that it was impossible for a single person to eat a dinner that should cost 500 francs, and that he would pay for it if he (the eater) could. The Vicomte de Viel Castel accepted the challenge.

"But when I say one person," he stipulated, "I don't mean a ploughman, but a *gourmet*, an epicure, myself; and when I say *eat*, of course it includes *drink*. Nothing is easier. I will dine, even here, at the Café de Paris, after drawing up my own bill of fare, and I will dispatch, without help, your 500 franc dinner.

"Leaving nothing in the plates and dishes?"

"Yes; I shall leave the bones."

"But you won't breakfast that day?"

"I shall breakfast as usual."

"Let it come off, then, to-morrow; here, at seven in the evening."

The *maitre d'hôtel* was summoned and consulted. It was the depth of winter; the Vicomte wanted forced fruits and vegetables; the shooting season was over; he insisted on game. The *maitre d'hôtel's* request for a week to prepare in was granted. The umpires were to dine at separate tables, to the right and left of the Vicomte's table. He was allowed two hours to dine in, from seven till nine, and he might either talk or hold his tongue.

At the appointed day and hour the parties met and took their places. The bill-of-fare was still a mystery. The first things served were twelve dozen Ostend oysters and a half-bottle of Johannisberg. The Vicomte's appetite was sharp; he asked for twelve more dozen oysters and another half-bottle of the same wine. Then came swallow's nest soup, which the Vicomte poured into a basin and drank off at a draught, like a cup of tea.

"*Ma foi, Messieurs*," he said, "I feel hungry to-day. Will you allow me to indulge a longing? I adore beef-steak and fried potatoes. That's an extra which I will pay for myself. Waiter, a bottle of Bordeaux, grand cru."

The umpires stared at one another. The beefsteak and potatoes were brought and consumed to the very last scrap.

"And now for the fish? *Messieurs*, this is a ferrat from the Lake of Geneva, the only place where it is found. It arrived this morning alive, in the water of its native lake. The ferrat is a delicious fish; I advise you to try it. Waiter, another bottle of the same Bordeaux."

Five minutes afterwards, all that remained of the

ferrat was the bones. Then came the truffled pheasant, which was demolished in about ten minutes more. Then the *salmis* or ragout of ortolans, ten in number, each of which made just one mouthful. Forced asparagus, green peas from Africa, strawberries and pineapple followed, with a half-bottle of Constantia; and then coffee and liqueurs; all of which were consumed to the last scrap and drop. The umpires acknowledged that everything had been executed loyally and literally aboveboard. It only remained to call for the bill. Total, 548 francs, 50 centimes. A few only of the items need be cited: swallows' nest soup, 150 francs; beefsteak and potatoes, 2 francs; ferrat, from the Lake of Geneva, 40 francs; two bottles of Bordeaux, grand cru, 20 francs; strawberries, 20 francs.

The only comment that need be made is, that for the same sum of money a plain but hearty meal might have been given to five hundred hungry men, women, and children.

POISONS IN FOODS.

METALLIC POISONS FOUND IN FOODS, DRINKS AND ARTICLES OF DAILY USE.

At a recent meeting of the Newark (N. J.) Medical Association, Dr. August Drescher, chemist to the New Jersey Board of Health, read a very interesting and instructive paper on the detection of mineral poisons in articles of diet and common use, which we condense as follows:

Chemists have found lead in canned foods over and over again, the lead being generally supposed to come from the accidental dropping of some solder into the contents of the cans while these were being closed, or the food, on being extracted from the cans, coming into contact with the solder. In samples of canned tomatoes and peaches, I have myself repeatedly discovered lead, and the scrapings of the inner tin-coating of their containers have invariably given evidence of the presence of that metal. Tin and lead may be alloyed in almost any proportion. The melting points of these alloys never agree, as might be supposed, with the mean of melting point or hardness of both metals, but quite the contrary; they diverge rather widely from the mathematically calculated figures for the same. Of this fact manufacturers of tinware are well cognizant. Tin and lead alloys are "more convenient and cheaper" than "plain tin." Doubtless there are manufacturers who do use pure tin, just as they claim, but they are certainly in the minority; thus, a number of our soda water apparatus makers now furnish tin pipe connections, etc., of pure tin. Far be it from me to say one word derogatory to the honest standing and dealing of men so inclined. Canned foods are now more largely bought and consumed than ever, for obvious reasons. In our day convenience, cheapness and dispatch are the desiderata. Why cook fresh fruit, corned beef, etc., while you can buy them "all ready made?" It is only necessary to warm them, and you will have a "hot dinner" in less than no time, and a cheap one at that time. The oft pointed-out danger of lead poisoning is pooh-poohed. Who ever died of eating canned foods? Directly, no one, it is true; and right here lies the danger. Had sudden deaths occurred from such a source, the public would doubtless have been aroused, and the resulting panic would have soon brought the delinquent to the corner. Lead, except in very excessively large doses, never kills at once. In point of fact, it is the Judas of metallic poisons. "Under the mask of a sweet taste," as the famous Professor Stoeckhardt very fittingly puts it, "it slowly, insidiously, yet surely, does its deadly work!" Bottled drinks (soda water, ginger ale, sarsaparilla and other "soft drinks," as well as wines, etc.), are exactly in the same predicament with "canned foods." It has been and is now a practice to clean old bottles by means of shot. Many authorities have, in the past and present, indicated the dangers of such

practice, and, by conscientious pharmacists at least, it is safe to say it has been generally abandoned. Not so, however, with bottlers of wine, soda water or other drinks with whom this reprehensible custom seems still to prevail. Shot contains, I would add, a not at all trifling quantity of arsenic, which is another very undesirable ingredient. The use of shot for cleansing bottles ought to be condemned outright.

During the summer I was entrusted with the task of testing "soft drinks" put up in bottles with patent metal and India-rubber stoppers. The analyses comprised my work for three manufacturers. Some of these beverages were found to be defiled with lead and copper, one with lead and arsenic, and the rest, with one exception, were proved to be contaminated with lead. All contained tin, but this metal is not considered to be poisonous. The stopples themselves were examined. They are generally composed of a loop of coated brass and a tin (and lead) button with an India-rubber belt. Analyses of them conclusively showed the presence of lead, copper, zinc and tin. These "soft drinks" are usually kept in boxes in "upside-down" position, thus favoring access of the beverage to the tin stopple (containing lead), and, though to a lesser degree, to the loop (composed of copper and zinc). The tin button with its India-rubber belt is thus in constant contact with the fluid, while this may suffer contamination by copper or zinc during the filling or emptying of the bottle, in cases where the coating (which is itself not unimpeachable) may have worn off more or less.

It is seldom, in our time, that we hear of metallic contamination of bottled wines or liquors. Suspicion rarely points that way, and examinations are consequently not called for. And yet, this ubiquitous foe sends his unerring arrow from even this quarter. In the year 1875 I was called upon to assist in an examination of a red wine, which was suspected of having been colored with aniline red. An afternoon birthday party of five persons had been attacked with vomiting and other alarming symptoms soon after having drank of this wine. Two of the number had been most severely visited by the distressing symptoms, and they were conspicuous as having been the "champions in the race," as far as relates to quantity imbibed. The host, a physician and pharmacist, puzzled, as might be expected, sent the rest of this wine to a chemist near by, with special directions to look for arsenic (coming from the suspected aniline). The chemist, a busy man, applied Marsh's test, and failed to find arsenic. He then referred the matter to me for further investigation. I also failed to find arsenic, but I found copper and zinc in appreciable quantity. Soft drink bottles with patent metal stopples, I have been informed, are now no longer cleansed by means of shot, better and more modern contrivances for the purpose being at hand. It is a well-known fact, that water, which has remained undrawn some time in our leaden aqueduct pipes may become polluted with lead, while oft-drawn water is not apt to be thus affected, it not finding the time to take up any of the metal. Similarly, shot standing under water, or being shaken up with it in bottles, may cause defilement; and this I have recently corroborated by direct experiment. As to the possibility of contamination of soft drinks in our usual metal stoppered bottles by means of the stopple itself, there can be no further doubt. Dr. Wm. K. Newton, New Jersey State Dairy Commissioner, of Paterson, has obtained—independently of my work (of which he knew nothing at the time) in this connection—results corroborative of my own. Later on, Dr. Harold, speaks of "lead in our soft drinks and in the tinned metal stopple," in a paper contributed to our local board of health.

Boilers, measures or other utensils of tinned copper, serving as receptacles or containers of foods or drinks, need faithful watching. If the tinning be of pure tin, it may easily wear off, more especially by exposure to acid or alkaline fluids, laying bare more or less of the underlying copper, which will then be a source of contamination. If the tin carry lead, our bill of fare will not fail

to offer also this questionable luxury. The same applies to brass and lead forks, knives and spoons plated with tin, nickel or silver. Tinned iron pots, measures, etc., are apt to carry lead; but I have, so far, found it in traces only, often very minute even, probably because of the small amount of lead present in the very thin tin coating of these cheap contrivances. The same might, seemingly, apply to tomato and other food cans of tinned iron, but we must here remember that in these cases there is more or less prolonged contact of food with metal, this enhancing the metallic invention. On opening these cans we often find them to be badly corroded on their inside surface, which circumstance in itself is loudly eloquent. Conversely, the tinned iron cooking dish, the measure, etc., are much less effected, they being used for the occasion, cleansed, rinsed and put by for future use. Tomato cans, etc., are used for their intended purpose but once; the cooking pots, measures, etc., a thousand times.

If clay, as found in the bosom of our mother earth, be not above our suspicion, we might at least expect to find it purified and suited to our uses, in the form of our familiar table pottery ware, comprising our coffee cups, dinner plates, milk pots, etc., these necessities of our daily life all appearing in our market of a milk-white color, suggestive in itself of purity. Even here disappointment awaits us, however. Clay is porous; to make it serviceable as pottery ware, it is glazed. In the process of glazing or enameling, the chief agent employed is lead oxide. If this were chemically completely used up so as to form lead silicate, which is generally insoluble, not affected by acids, etc., we would have little to fear from this source. If, however, the lead oxide should have been used in excessive amount, or, what is equally noteworthy, the temperature in the glazing process should not have been driven high enough, so as to result in using up all of the lead oxide, changing it to the form of insoluble lead silicate, we would have to face the danger of lead pollution. Our cheap glazed and enameled clay ware is generally unsafe for this very reason. Extensive experiments made within the last few years by unquestionable authorities in Germany, lead to the conclusion that the common clay ware manufactured in that country, in very many cases yields lead by treatment with vinegar, hot or cold, more or less, according to the extraction method employed. The clay goods of our American market, according to my own observations, are exactly in the same predicament. While conducting the experiments on glazed ware, I came across many samples of our now well known blue glazed metal pots, etc., and I am ready to state that I have found them safe in every single case, they failing to impart lead to fluids acid or alkaline, even after prolonged boiling with them. European governments allow definite quantities of lead in glazed ware. It is even claimed that a certain amount of lead is indispensable in the glazing or enameling process; but the lead should never be present in soluble form.

The India-rubber tubing, stopples, infants' nursing bottle fittings, nipples, etc., of our market I have found to contain large quantities of zinc, which is a metallic poison. The use of zinc oxide, etc., in these goods is prohibited by law in Europe, just as is the use of lead oxide. That nursing bottle tubing, nipples, teething rings, etc., may stand in some relation to certain infantile diseases seems plausible. India rubber tubes are often used for siphoning wines, ciders and other beverages which might thus become polluted with zinc. It is noteworthy that in my examinations of India rubber goods I have never yet discovered lead. Zinc oxide, *per se*, is not, perhaps, a poison. But, let it meet an acid, a poisonous zinc salt will result.

Poisonous metals or their compounds in these preparations for external use are considered to be dangerous to health because of their liability to be absorbed by the skin, or even carried to the mouth inadvertently by the hands, with which they may have been applied. Many hair dyes contain lead in large quantity, as has

often been found by chemists. White lead and calomel are regular ingredients in many of our toilet and cosmetic preparations. I have recently found white precipitate (a very poisonous mercurial compound) to be the chief constituent of a "cream face wash." White precipitate and red precipitate, both of mercurial parentage, are often bought in drug stores for the preparation at home of ointments, etc., which are empirically employed. Not without danger, most assuredly. The general use and application of such powerful poisons had better be left to the discretion of the physician, he alone understanding the system and manner of their application. The conclusion of my remarks is this earnest admonition to the public: Be careful how, what, out of what, with what you dine and drink; be careful what you apply to your face, hair, hands, or any part of your body.

WHAT TO EAT.

SUGGESTIONS FOR THE EFFECTIVE REPAIR OF BRAIN-WASTE.

A physician, writing on the food necessary to give strength and sustenance, says that if a person uses up his brain faster than he makes it he soon becomes nervous and irritable. If he does not assimilate enough food to supply its demands his mind is sure to become weak. The healthiest and strongest individuals, even, should eat a far greater proportion of meat than of vegetable food. Beef should be taken as the standard meat. It answers every purpose of the system. Veal and pork are not as easily digested. Pork, so far as its composition goes, is an excellent food for nervous persons, but it is not readily digested. Yet, in the army, we used to think nothing better for the wounded men than bacon. As a rule, salt meat is not adapted to the requirements of the nervous individual, as nutritious juices to a great extent go into the brine. The flesh of the wild birds is more tender and more readily digested than that of domestic ones. This is accounted for by the greater amount of exercise they take, thereby renewing their flesh more rapidly and making it younger than that of birds which lead a more quiet life. This is a suggestion that might be of benefit to women of sedentary habits, who are desirous of prolonging an appearance of youth. Fish of all kinds is a good food for the nervously inclined. Raw eggs, contrary to the general opinion, are not as digestible as those that have been cooked. A notion has been prevalent that many persons injure their digestion by eating too much. The fact is that most people don't eat enough. There are more people killed every year by insufficiency of nourishment than by overloading their stomach. Many of those who do eat a sufficient quantity are prevented from disease by digesting enough for the economy of their systems. The very first thing for any one to do who has exhausted himself by mental work or who has been born weak and irritable, is to furnish his brain with sufficient nourishment either to repair the damage it has sustained, or to build it into a strong, healthy condition. People in this condition usually suffer from nervous dyspepsia. Their stomachs are unable to perform the labor of assimilation. Owing to the deficient nerve power of the individual the food lies in the stomach unacted upon by the gastric juice, because there is none or the quantity is insufficient to have any power. Food, instead of helping to renew the body, and the nervous system with the rest, undergoes fermentation, and the body and brain it should nourish may starve. The person is in a worse state than if the food had not been taken, for the fermentation generates acids and gas. Nervous individuals may derive all the fat they need from sugar and starch. It is better, however, for those with weak digestive organs, or whose nerves are in a highly sensitive state, to get it from the animal kingdom than compel their enfeebled stomachs, intestines and

pancreas, to create it out of these articles. Good bread, sweet butter and meat are the best foods for the nerves. People troubled with insomnia, nervous starting from sleep and sensations of falling, can often be cured by limiting themselves to a diet of milk alone for a time. An adult should take a pint for a meal, and take four meals daily. People with weakened nerves require, usually, a larger quantity of water than those whose brains and nerves are strong. It aids in the digestion of food by making it soluble, and seems to have a direct tonic effect. With proper eating and drinking we should have fewer broken down, nervous wrecks, and far more vigorous intellects. The present human species cannot eliminate flesh from its food and amount to a row of pins. The fancy that nothing but vegetables should be eaten is apt to overtake every one somewhere in life. It is due to some disorganization, and usually passes away with the disturbance that created it.

PROTECTING THE CONSUMER.

SAFEGUARDS MAINTAINED AT THE STOCK YARDS IN CHICAGO.

The Union Stock Yards at Chicago are the most important cattle yards and largest market in the world. To show the public what care is taken to prevent diseased cattle from being slaughtered for food, we quote some extracts from the rules governing the handling of cattle at these yards. These rules are rigidly enforced.

Diseased animals and meats are condemned.

Dead hogs, 100 pounds and over, $\frac{1}{2}$ c. per pound less than 100 pounds, of no value.

Broken-ribbed and bruised cattle docked \$5 per head.

Public inspectors dock pregnant sows 40 pounds, and stags, altered boars, 80 pounds each. Public inspection of hogs, 15c. per car.

Some explanation may be necessary.

The second of the rules quoted refers to the price paid for dead hogs. Provision is made by which a rendering company seizes all dead animals. Docking means that a deduction is made from the market value. This rule prevents the sending of animals known to be injured to these yards, and the deduction is also sufficient to permit such animals to be bought and killed for hide and tallow for commercial uses. The stock yard company evidently does not mean to allow any fraud upon the public to be perpetrated.

GIVE THEM UP.—When the doctors give you up, there is only one way to get well; and that is to give the doctors up.—*Fliegende Blätter*.

PROTECTIVE RISKS.—An indignant landlord writes demanding the name of the party who first suggested putting coils of rope in sleeping rooms as a protection against fire. He says he provided every bedroom in his house with a coil of rope, and the first night three of his guests lowered their baggage from the sixth-story window and skipped, leaving several days' board bill unpaid. He allows that being burned to death is bad enough, but running a hotel for fun is a good deal worse.

HOW TO FORGET SORROW.—A druggist recently received a visit from a lantern-jawed, hollow-eyed man, who asked in cadaverous tones if he could give him any remedy that would drive away a nightmare-like care that was preying upon his health. The man of drugs nodded, and compounded a mixture of quinine, wormwood, rhubarb and Epsom salts, with a dash of castor oil, and offered it to the despairing patient, who apathetically gulped it down. History avers that for six months he could not think of anything except new schemes for getting the taste out of his mouth.—*British and Colonial Druggist*.

DOMESTIC DIETETICS.

SPECIALLY PREPARED, FROM PRACTICAL TESTS, FOR THE
LADY READERS OF THE "AMERICAN ANALYST."

SEASONABLE FOOD.

January.

MEATS.—Beef, mutton, ham, kidneys, liver, venison, sausage, pork.

GAME AND POULTRY.—Grouse, hare, pigeon, quail, chicken, duck, turkey, rabbit, goose.

FISH.—Bream, cod, crabs, eels, carp, flounder, halibut, herring, lobster, mackerel, mussels, oysters, perch, pike, rock-fish, salmon, smelt, whitefish.

VEGETABLES.—Artichokes, beets, beans, cabbage, carrots, cauliflower, celery, garlic, lettuce, onions, parsley, parsnips, potatoes, shallots, spinach, squash, tomatoes, turnips.

FRUIT.—Apples, bananas, grapes, oranges.

PRACTICAL RECIPES.

TOMATO SOUP.—Four quarts clear soup, one quart strained stewed tomato, one teaspoonful sugar, one tablespoonful corn starch, one tablespoonful butter. Stir all together, season, boil a few moments and serve.

BEEFSTEAK PUDDING.—Take two pounds of round steak, one teaspoonful each of summer savory, celery salt, and one small onion chopped very fine, a sprig of parsley, salt and white pepper. Cut the steak up into small pieces and place a layer of it in a buttered dish, the sides of which you have lined with paste. Sprinkle over the steak some of the onion, celery salt, etc.; add another layer of steak and seasoning until all is used, then pour over it a little water and cover with paste. Place on the top of it a buttered paper, and stand it in a basin of boiling water, cover it tight, and let it boil two hours and a half. To make the paste, take one teacupful and a half of flour, a half teaspoonful of salt, and two tablespoonfuls of roast beef drippings, and wet it with a half teacupful of water. This quantity will make a dish sufficient for five persons, with the customary vegetables.

BAKED SPANISH ONIONS.—Peel four Spanish onions, put them in cold water with a small lump of soda, place on the fire and let them come to the boil, and then simmer them gently for half an hour; drain thoroughly, and put them in a baking dish with a little butter and bake till brown.

CANNED SALMON.—Cut round the top of the tin; place it in boiling water for a few moments, until thoroughly heated through, taking care, however, that the water doesn't reach sufficiently high to be in danger of flooding the contents. Have ready some nicely mashed potatoes, and arrange them in a wall around a very hot dish; turn the salmon into the centre of this, removing any pieces of bone there may be. Sprinkle a few capers over it, interspersed with morsels of fresh butter, and serve immediately, before it has time to chill. Rice, boiled as for curry, is sometimes substituted for the potatoes by those who prefer it.

BAKED LOBSTER.—Put a lump of butter in a saucepan, add a couple of teaspoonfuls or so of flour, and cook for several minutes, stirring all the time; thin to a thick cream with milk; add to this sauce the chopped meat of the tail and claws of a lobster, and a pinch of the coral which has previously been dried in the oven, and pounded. A little cayenne is an improvement, with a few drops of lemon juice. Put this in small baking dishes, one for each person; sprinkle with bread crumbs and a pinch of allspice and cloves. Bake a few moments till brown.

BERKSHIRE COOKIES.—One cupful of molasses, a teaspoonful of soda; dissolve in a half-cupful of cold

water, a dessertspoonful of salt, a tablespoonful of melted butter, one dessertspoonful of ginger, flour enough to roll out to the thickness of an inch. Bake in a quick oven for about ten minutes.

A ROLLA POLLA.—Beat together two cupfuls of sugar, one cupful of butter, one egg, two cupfuls of cream, half a glass of wine, three cupfuls of flour, a heaping teaspoonful of Horsford's baking powder, half a pound of seeded raisins. Pour into a pudding bag, and boil for three hours. When done, serve hot with a cream sauce.

ARSENICAL POISONING.

ITS FREQUENT AND FAMILIAR OCCURRENCE.

The AMERICAN ANALYST has on several occasions pointed out some of the dangerous coloring materials used by manufacturers of articles for domestic use. A new confirmation of our warnings is furnished in an article by A. W. Stokes, F. C. S., F. I. C., in the London *Chemical News*:

"Some few months ago I examined for a large firm of household furnishers, as well as for numerous private individuals, a number of samples of the then fashionable 'imitation Indian muslins' and cretonnes. More than 100 samples were examined, and 23 per cent. of these were found to contain arsenic in appreciable quantities. In all qualitative cases, Marsh's test was used, and only such samples as gave within five minutes indications of arsenic were marked arsenical. Several were quantitatively examined. The highest proportion of white arsenic found was 2.10 grains per square yard. The colors in which arsenic was principally present were the terra-cotta reds and the greenish browns. There being some doubt whether these materials would give off arsenical vapors, I made some experiments. From this it would seem that under ordinary circumstances, arsenic would not be evolved by such fabrics. Yet in two cases samples of these materials were brought to me by medical men, in which well-marked symptoms of arsenical poisoning were ascribed to their use. In one case some six or eight work girls employed in making up some of this material were all taken ill with the same symptoms of arsenical poisoning. Of course, in such case the material, when pressed with hot irons, is heated far beyond blood heat, and minute particles are detached and float in the air of the workroom. That the arsenic is held very loosely by the fabric was evidenced by dipping some of the fabric in water. Plenty of the arsenic was at once taken up by the water. It would seem at first as if this might be due to arsenic having been used as a preservative for the size or starch present as 'stiffening,' but then these muslins have no stiffening. A little flax mat of green color, weighing 9 ounces, contained 21 grains of white arsenic. I found my infant playing lately with a small glazed cardboard box of a green color that had once contained chocolate, and that had been obtained from one of the automatic supply boxes. After the manner of infants, he was occasionally sucking this. Out of curiosity I tested it, and found that the 'surface paper,' measuring 5 inches by 1¾, contained 1.10 of a grain of white arsenic. In all these cases the quantity of arsenic found is small, and it may be, under ordinary circumstances, quite harmless, but in all cases its presence is quite unnecessary. Other coloring materials could equally well be used in which there is no possibly noxious ingredient. Of wall papers submitted to me, 10 per cent. are found to contain arsenic. This is a high proportion, but then only suspected samples are sent for analysis. One of my rooms I found thus papered. Neither are those who avoid wall paper altogether safe. A lady some two or three years ago had her rooms painted, and covenanted with a sanitary decorating company that they should use on the walls paints containing neither lead nor arsenic. Pieces of the moulding she brought to me contained both lead and arsenic in the color. Omitting articles in which its occurrence has been purely accidental, arsenic has been found of late years to be present in some samples of muslins, cretonnes, wall papers, playing cards, the glaze of some enamelled stew-pans, the paper of fancy boxes, and in some furs. These last are usually the furs prepared by amateurs. So that we may picture an infant placed by an unfortunate concurrence of circumstances in a room covered with arsenical paper, having its cot draped with muslin or cretonnes, fed on food prepared in a glazed saucepan, itself covered by a rug, and playing with some fancy box of sweets or toys, all of these containing a minute but unnecessary amount of arsenic.

PICKLING OLIVES.

HOW THEY ARE PREPARED BY CALIFORNIA CULTIVATORS.

The olive raisers of California have different methods of preparing the fruit for pickles. The one adopted in Santa Barbara is as follows: The berries are put in fresh water, which should be changed every day, for forty or fifty days; then put in salt brine, not very strong, and, after remaining a few days, drawn off, a second brine substituted, made nearly strong enough to bear an egg. The water should be boiled. Keep the olives well covered with the brine. Great care should be taken in handling the berries so as not to bruise them. The easiest plan, when picking from the tree, is to drop them in water. They are usually picked when they begin to turn a purplish color. Another method, copied from the *Pacific Rural Press*: Pick the olives as soon as they begin to show a reddish cast, and rinse them in clean water. Then take one ounce of concentrated lye and dissolve it in water. One-third of this solution put in water enough to cover one gallon of olives. After a day or two pour off this water, and add another lye of the same strength. This may be repeated once more, as five or six days are consumed in taking out the bitterness with the lye. The lye should be used until the fruit suits the taste. Then the olives are put in pure fresh water until the alkali is well removed. This can be ascertained by the color of the water and by the taste. In salting, use the best Liverpool "coarse fine" salt, the amount being about ten pounds to the barrel of olives, water enough being used to cover the fruit. Barrel up tight, and keep in a cool place. All the process should be conducted in the dark, as the light is apt to injure the color. The celebrated olives pickled after the manner of Picholine are put under a treatment of lye made more alkaline by the addition of quicklime. After leaving the olives a certain length of time, until the pulp separates easily from the seed—a condition which depends upon the strength of the lye and the size of the olives—they are then washed and put in strong brine. In the South they flavor with fennel and coriander; sometimes they substitute in place of the seed a small piece of anchovy and a caper. In the latter case the olives should be in oil.

STONE SMASHING.—It is well known that a stone, however large, may be broken by striking a sufficient number of blows with a hammer along the line where it is desired to break the stone. In this process the force of the blow is expended in gradually weakening the cohesion of the particles in a line following the direction of the blows. This weakening is increased by each successive blow until finally rupture occurs.

TESTING ROOF SLATES.—A German trade journal advocates the following method of testing the quality of roof slates: The samples of the slate to be tested should be carefully weighed and then put into boiling water for a quarter of an hour. The water must, however, be fairly free from lime, saltpetre and ammonia. The slates are then re-weighed, and those that show the greatest increase of weight are those most capable of resisting deterioration.

AUTOCOPYING PRESSES.—Several improvements are claimed in autocopying printing presses by Mr. T. Reiner, of Leipsic. He provides two cylinders which may act as receiving surfaces for the writing, and which also operate with pressure to feed the paper to be printed upon. The patentee provides the cylinders with a surface composed of a mixture as follows: 100 parts soluble glass, 10 parts whiting, 10 parts magnesium carbonate, 10 parts silicate of magnesia, 10 parts glycerine, 10 parts water, 5 parts oxalic acid, 5 parts manganese ore and 5 parts mineral color. These substances may be used on any suitable supports, as plates of metal, glass, earthenware, for replacing lithographic stone. In combination with the cylinders is an ink trough consisting of two parts separated by a slit having a regulating screw. By the action of a lever the inking mechanism may be thrown in or out of action.

NEW USE FOR ELECTRIC LIGHT.—The body of a boy drowned at Winchendon, Mass., recently, was found through the use of the electric light, a bulb being fastened to a pole and submerged, illuminating the water for a considerable distance in the neighborhood. The electric light promises to become an important aid in all manner of submarine operations.

CONGESTIVE AND GASTRIC CHILLS.

While the familiar expressions, "Congestive chill" and "Gastric chill," are not, properly speaking, scientific, yet they represent facts of the highest interest and importance. All chills, so-called, are of one general type. A heated portion of the body is suddenly reduced in temperature. A feeling of cold, at first local and shortly afterwards general, is noticed, followed by a reaction in which high fever and extreme weakness are the main features. Gastric chills, for instance, are produced in children who eat excessive quantities of ice cream, who drink large amounts of ice water, or who go in swimming after a hearty meal. They are produced in adults by the same cause, although not to so great an extent, and also by the use of ice-cold summer beverages, now so generally in vogue. There is no doubt in the minds of the more advanced physiologists but that bronchitis, laryngitis, tonsillitis, asthma, coryza, and, deadliest of all, pneumonia, are similar in character, development and origin to the so-called chills, and are to be prevented and remedied in very much the same way. In every instance, when these ills are critically studied, the system is found to be in a diseased or unhealthful condition and the blood full of impurities. Dr. Miller, who deserves much credit for the successful introduction and development of the Turkish and Russian baths into the United States, says, in his writings on pulmonary diseases, that he never knew of a chill occurring in a person whose blood was perfectly pure. Scrofulous people, sufferers from malaria, men and women prone to sick headaches, chronic constipation, indigestion, skin eruptions, are the chief sufferers. On the other hand, athletes, young men and

women who exercise a great deal, and adults who engage in hard manual labor, are singularly exempt. In other words, those who are best qualified by nature to resist all physical ailments seldom or never suffer, and those who are already in a condition not far removed from disease itself are afflicted upon the slightest provocation. In nearly every instance of a serious chill, there is, beyond the fact of illness, the possibility, if not the probability, of intense pain and death. The truest wisdom lies in preventing all these ills by purifying the blood and restoring all the great vital functions to a normal state of efficiency and action. In accomplishing this end, not only is all danger from chills and colds reduced to a minimum, but the entire organization is strengthened and improved. In purifying the blood, the whole body is purified and ameliorated. To effect the purpose, Ayers' Sarsaparilla is the best. Other medicaments of value there are, but not one known to chemist or physician, will do the work so efficiently performed by this powerful alternative. It promptly dispels and expels the humors which clog up the minute vessels of which the human frame is composed. The liver, kidneys and bowels are changed from lethargy and mal-action to high activity and thorough cleansing power. The skin clears off as the impurities are removed, giving a handsome complexion and allowing the millions of pores and glands to again fulfil their functions. With the blood purer and stronger, the appetite increases and the palate regains its pleasurable powers of appreciation. Digestion is improved and accelerated, and the nerves and brain receive a new impetus. In a short time health and strength have replaced delicacy, disease and weakness, and the danger from all the ailments which are occasioned by colds and chills is annihilated.

BINDERS FOR THE AMERICAN ANALYST.

We have selected the "Handy Binder" for binding the ANALYST, because of the following advantages: It is elegant in appearance, strong, durable and this new

method of binding allows the opening of the pages perfectly flat, owing to the fact that none of the side of the paper is used. This method also permits the taking out and replacing of one or more papers from any part of the file without disturbing the other parts. After the file is completed it ceases to be a temporary binder, and with its contents becomes a perfectly and strongly bound book. Owing to the unusual size and strength of the linen binding cord in combination with two metallic binding strips (loops) the strength and durability of the binding is wholly unequaled by any method yet introduced. Price, sent post-paid, 75 cents. To any subscriber renewing his subscription at \$1 sent directly to this office during December, 1888, we will send one for 25 cents, and we will give one free as a premium for every new subscription sent to us with \$1.

BUSINESS NOTES.

CRYSTALS.

This is a new cereal food prepared from the heart of barley, made by Farwell & Rhines, of Watertown, N. Y. It has been well introduced, is liked by all who have tried it, and has the great advantages of being adapted to more uses, more quickly cooked and sold cheaper than other cereal foods. In order to still better introduce it, the manufacturers have issued the following circular to grocers, which speaks for itself:

WATERTOWN, N. Y., U. S. A.

DEAR SIR: If you order one keg or more of our patent barley "Crystals," and will send us a list of your customers, with their post-office addresses (residences), we will mail to each one a postal card order for one pound for trial. When these orders are presented and filled by you, please mark them paid and sign your name, and return to us at your convenience, and we will remit for same at the rate of five cents per pound. We think this will advertise you and us, and thoroughly introduce and make a demand for the goods. Please read the other page carefully, and oblige us. A circular containing directions for use should be given with each package. Respectfully, FARWELL & RHINES.

LOOK OUT for Imitations and Substitutes OF *Horstford's* ACID PHOSPHATE.

A variety of imitations and substitutes of this standard preparation have appeared under the name "Acid Phosphate," or a similar title, all of which differ materially from the genuine article.

Be sure the name "**HORSFORD'S**" is on the label. No other genuine.

N. D. ARNOLD, TREAS.

Providence, R. I.

Rumford Chemical Works.

"Coming events cast their
Shadows before."

PEARLINE

From the start, the
shadows have read, *Pyle's*
Pearline is mightier than
soap, muscle and washboard

combined. It is the modern soap. Nowadays one cannot afford to reject a new idea because it promises "big things." These are days of "big things." Wide awake men and women are looking for them. She who refuses the aid of PEARLINE is behind the times—far behind. She might as well reject the comfort and aid of the steam car—sewing machine—telegraph—electric light, etc., because she does not believe in them. Millions appreciate Pearlina, and have for years. Millions more will appreciate it—you will—why not begin at once to use it. Its prodigious popularity proves its merit—you have everything to gain, nothing to lose, therefore try it.

Beware

Peddlers and some unscrupulous grocers are offering imitations which they claim to be Pearlina, or "the same as Pearlina." IT'S FALSE—they are not, and besides are dangerous. PEARLINE is never peddled, but sold by all good grocers.

FOR THE **THIRD TIME**

In our history we have been forced to move into larger quarters to keep up with the demand from our New York, Worcester, Springfield, Providence, Lynn, New Haven, and two Boston stores, and our enormous mail trade. We now occupy two-thirds of an acre of space devoted entirely to custom-work, turning out more garments than any house in the United States. You can order by mail by our system as safely as if you could call at one of our stores. To obtain the Famous Custom-made Plymouth Rock **\$3 Pants**, first, send 6 cents, for which we will mail you 20 samples self-measurement blanks, and linen tape measure, provided you MENTION THIS PAPER, or if you cannot wait for samples, tell us about the color preferred, with waist, inside leg, and hip measures, remit \$3, together with 35 cts. to cover cost of expressage or postage, and we will forward the goods prepaid to any address in the U. S., guaranteeing safe delivery and entire satisfaction or money refunded. Remember, also, that we make to your order, Full Suits, \$13.25, Overcoats, \$12.00, and that for any cause we refund money at buyer's request upon return of goods, or make alterations or new garments free of extra charge.

NATRONA BI-CARBONATE OF SODA.

(ABSOLUTELY PURE.)

NATRONA

SODA

The nature of the raw material from which NATRONA BI-CARBONATE OF SODA is made—viz., kryolith, a mineral containing pure sodium—insures a purity and uniformity of product which cannot be obtained from any other known material. In making Bi-Carb. Soda from any other raw material, the use of sulphuric acid is a necessity, but none is used in any part of the process of making NATRONA BI-CARB.; hence its entire freedom from the slightest trace of arsenic, which is always present in ordinary soda. Its absolute purity and entire freedom from all traces of sulphate of soda, common salt and other impurities, render NATRONA BI-CARB. NEARLY TASTELESS, and being bolted through the finest bolting-cloth, insures the finest stage of division.

To these indisputable facts the attention of CONSUMERS of soda is specially called. They are IMPORTANT, and should influence both those who use and those who sell soda, to buy and sell NONE BUT THE BEST.

The NATRONA BI-CARB. Soda is kept in stock by almost every wholesale druggist and grocer throughout the United States, of whom it may be ordered.

Natrona Bi-Carb. Soda is unequalled by any other brand of English or American Manufacture.

LEA & PERRINS' SAUCE.

Lea & Perrins', the original and genuine Worcester-shire Sauce, has been before the public over a half a century. Like all popular favorites it has long been the standard of comparison and the pattern for counterfeiters who not being able to imitate its excellence offer to the public imitations in bottling, labels and style of putting up. They dare not counterfeit the signature of Lea & Perrins which is on the red label of every genuine bottle, and of which this is a facsimile.

Lea & Perrins

To be sure of obtaining the genuine article, see that the above signature is on the label.

ALTHENE SKIN SOAP

An absolutely pure and perfect soap for all purposes of the toilet, nursery, bath or sick-room. Has the approval of leading chemists and physicians, and is recommended by all who have used it. Price 25 cts. a cake, or 65 cts. for a box of three. Can be obtained of the retail druggists or from

COLDEN'S

ORIGINAL LABEL:
"Colden's Liebig's Liquid Extract of
Beef and Tonic Invigorator."

LIQUID

BEEF TONIC.

AN INVALUABLE AID IN THE TREATMENT OF
ALL CASES OF DEBILITY.

Established 15 Years. Endorsed by Scores of Physicians.

Essentially Different from all other Beef Tonics.

Beware of Imitations.

COLDEN'S LIQUID BEEF TONIC consists of the Extract of Beef (by Baron Liebig's process), spirit rendered non-injurious to the most delicate stomach by extraction of Fusel Oil, soluble Citrate of Iron, Cinchona, Gentian and simple aromatics. An official analysis of this preparation by the eminent chemist ARTHUR HILL HASSALL, M. D., F. R. S., and an endorsement by SIR ERASMUS WILSON, F. R. S., is printed on the label of each bottle.

Its Range of Action Embraces all Cases of Debility.

By the urgent request of several eminent members of the medical profession, I have added to each wineglassful of this preparation two grains of SOLUBLE CITRATE OF IRON, and which is designated on the label as "No. 1," while the same preparation, without Iron, is designated on the label as "No. 2." It acts directly on the sentient gastric nerves, stimulating the follicles to secretion and gives to weakened individuals that first pre-requisite to an improvement, an appetite.

I will, upon application, send a sample bottle of Colden's Liquid Beef Tonic to any physician in regular standing. Please ask your Dispensing Druggist (if he has not already a supply) to order it. In prescribing this preparation physicians should be particular to mention "COLDEN'S" viz: "EXT. CARNIS. FL. COMP. (COLDEN)." It is put up in pint bottles and can be had of Wholesale and Retail Druggists generally throughout the United States.

C. N. CRITTENTON, Sole Agent,

115 Fulton Street, N. Y.

Please Mention the AMERICAN ANALYST.

THE TORSION**Braided Wire Mattress.**

At all times a thoroughly ventilated and perfectly clean mattress, it cannot absorb odors, or retain exhalations or disease germs.

D. HAYES AGNEW, M. D., Prof. of Surgery, University of Pennsylvania, says:

"The Torsion Braided Wire Pillow and Mattress I regard as superior to anything of the kind now in use; well suited for either private or hospital use."

Prof. W. M. H. PANCOAST, late Professor of Anatomy, etc., in Jefferson Medical College, now Professor of Anatomy and Clinical Surgery in the Medico-Chirurgical College of Philadelphia Hospital Surgeons, says:

"I have used in my surgical practice your Braided Wire, in the form of mattresses, pillows for the head and body, and short pillows for the arm and leg when injured. I find them most admirable, cool and light, yet affording perfect and elastic support."

I have saved a patient from bed sores by the use of the Braided Wire mattress."

WM. H. FORD, President Board of Health, Philadelphia, says:

"I have used the Torsion Braided Wire Mattress with great satisfaction, it is light and therefore easily handled; it is elastic and very comfortable. The case can be easily removed to afford a complete airing, a feature of great importance from a health point of view. It is an invention of great usefulness."

A NEW USE FOR LIQUID PEPTONOIDS.

Successfully used in Dissolving the False Membrane in Diphtheria.

A Physician writes: "In an experience of over thirty years I have never used anything to equal your LIQUID PEPTONOIDS as a local application with a spray. It will dissolve the membrane and destroy the diphtheretic odor in less than twenty-four hours. I use the LIQUID PEPTONOIDS full strength, as a spray, two or three times a day, in bad cases."

Used successfully by another physician in two desperate cases:—"I was induced to try LIQUID PEPTONOIDS in two very desperate cases of DIPHTHERIA. I think I never saw throats more heavily coated with exudate than were these, and I think I never saw it more rapidly disappear than in these cases, by frequent spraying with your LIQUID PEPTONOIDS."

LIQUID PEPTONOIDS can be taken by patients unable to ingest food in any other form. In dyspepsia and loss of appetite its effects are positive, its digestive properties assisting in the digestion of food taken and its peptogenic properties quickly stimulating the natural digestive secretions of the stomach.

PANCROBILIN.

Prepared (in both Liquid and Pill form) from Extract of Pancreas and Bile.

This preparation is designed expressly to increase the digestion and absorption of fats.

We believe that the fat-digesting properties of pancreatine and bile are inseparable, and that without their union in the intestinal tract but little, if any, fat would be digested and absorbed.

PANCROBILIN will be found of great service in Phthisis and other wasting diseases, Nervous Prostration, Constipation, Inanition, Malnutrition, Intestinal Indigestion and wherever there is a failure to assimilate fats.

If the skin is first wet with LIQUID PANCROBILIN, the inunction of oils will be greatly facilitated.

LIQUID PANCROBILIN is put up in pound bottles. PILL PANCROBILIN is put up in bottles holding 100 pills. The coating of the pills will resist acid digestion, when given as directed, but will be quickly dissolved in the alkaline secretions of the duodenum.

PHOSPHO-CAFFEIN COMP.

(Granular Effervescent.)

Formula for each dessertspoonful:—

Caffein.
Acidi Phosphorici aa, grains, ss.
Antipyrin.
Ext. Apii. Grav. dulc. (Celery), aa grains, j.
Sodium Bromide, grains, v.

The satisfactory results produced by PHOSPHO-CAFFEIN COMP. in Headaches, Neuralgia, Insomnia, Neurasthenia and general Nervous Irritability, are not due to the effect of any one ingredient, but to the happy effect of the combination. A thorough series of comparative tests have demonstrated the superiority of the above formula over any other in the market.

Tabasco Pepper Sauce OR LIQUID PEPPER.

Is simply the Pulp of the Ripe Pepper Extracted by Pressure.

The seed of this Pepper was obtained from Central America, and by careful cultivation in Louisiana for many years has been so improved in strength, flavor and aroma, as to have become a new variety of Red Pepper, superior to all others. The pulp is so handled as to retain all the flavor, strength, aroma and color of the ripe fruit, and to keep unimpaired in any climate. It excites the appetite, promotes digestion, and is pronounced, by connoisseurs, to be the finest condiment in the world. For medicinal purposes it recommends itself by its purity, strength and diffusible form.

Manufactured by E. McILHENNY,
NEW IBERIA, LA.

For Sale by all Wholesale Grocers.

SWIFT'S Choice Chicago Dressed Beef — AND — MUTTON.

CAN be found at all times in full supply and at popular prices at the branch houses in all the larger cities and is retailed by all first class butchers.

The trade of all marketmen and meat dealers is solicited for our Wholesale Branch Houses, and the public may rest assured that in purchasing our meat from dealers they will always receive the best.

NUMBER ONE HUNDRED.

At this period, when centennial celebrations are especially in vogue, we feel particular gratification in placing before the public the One Hundredth issue of the AMERICAN ANALYST. Thankful for the support our efforts have been rewarded with in the past, and fully appreciative of the continued patronage which attends us now, we are encouraged to look forward with hopeful confidence to a permanent career of successful usefulness. More than four years have passed since we undertook, the pioneers in the effort, the contest against those deadly enemies to human health and happiness, the adulterator and the falsifier of food. It is with heartiest satisfaction we look back, from the standpoint of this centennial issue, over the field on which the struggle has been so pertinaciously and so uncom-

promisingly maintained. To recapitulate the fraudulent devices whose unblushing audacity has been exposed and overthrown through the instrumentality of the AMERICAN ANALYST, would form a list of greater length than we could afford space to in our crowded columns. The whole army of sophisticators, high and low, with their false pretenses of foods, medicines, substitutes, specifics, cure alls and tricky preparations of every character and name, have been revealed in their true light to the world, with almost uniformly disastrous results to themselves and their nefarious devices. Our readers can recall with ease the series of flaming frauds which have been projected, with lavish expenditure of money and curious fertility of advertising invention, upon the public attention during the past few years, only to collapse when subjected to the keen sunlight of honest investigation. The work has been done thoroughly, but it is far from being completed. Human nature will have been raised to a higher plane of moral excellence than it now seems susceptible of attaining to before men shall have ceased seeking to enrich themselves through deception of their fellow creatures. But the sophisticator's field of operations is steadily contracting, and the most venturesome enters it now with full knowledge that his success can be at best but brief. While exposing and denouncing these dangerous frauds, the AMERICAN ANALYST has been performing another and scarcely less valuable service by showing up the folly and truthlessness of the numerous sensational stories with which conscienceless scribes succeed in imposing upon newspaper editors in relation to the prevalence of adulteration. Exaggerating an evil is often as operative to retard its reform as the assaults of ignorant opposition. As already stated, we were the first to enter this particular field of enterprise, and we still stand alone in it; for though we have from time to time been promised companionship, the promise has always failed to materialize. There was a Philadelphia concern, consisting of a lawyer and a few philanthropic dupes, who undertook to engineer an anti-adulteration "crusade" on a national basis, and who for a while afforded a subject of amusement, and then were re-absorbed in the sublimity of their own ineffectiveness. Here in New York, too, was an "organizing" genius who, a couple of years ago, undertook to reform trade and society and, for aught we know, religion, shoe-making, and the universe, by the application of a scheme of "organization," the basis of which was that all his fellow-organizers were to subscribe to his journal, and accept him as their high spokesman. He, too, has been "organized" out of the subject. Then there was the coterie of retail grocers, who were agitated by a "movement" which subsided as soon as the emptiness of its true inwardness was exposed, and who we hope are now more comfortable. Nor should we omit to mention those pair ots who twice have contrived "conventions" at the national capital, where they strutted and fumed, and adjourned, leaving the cause they proposed to sustain, on both occasions, more hopelessly undisposed of than before. Daily journalism also has occasionally ventured into the arena, as in the case of our enterpris-

ing contemporary, the *World*, a year or so ago, but the venture has always been abruptly and speedily relinquished. The difficulty in all these instances, and some others we might cite, lay largely in the nature of the subject, but more in the fact that the persons endeavoring to grapple with it did not come into the discussion with proper equipment, nor with an adequate appreciation of the magnitude of the task they had undertaken. The AMERICAN ANALYST, however, has "got there," and the steady increase of our subscription list indicates that we are there "to stay." Meanwhile, several valuable new features have been added to the journal, the issues have been increased from twenty-four to fifty-two a year, while the subscription price remains unchanged—one dollar a year to every part of the United States and Canada.

ILLOGICAL CENSURE.

The AMERICAN ANALYST, a newspaper published in New York City, has been devoting considerable of its space to the Western dressed beef packers and the butchers' associations—eulogizing the former and damning the latter. We would respectfully suggest to our contemporary that it set its analysts to work on some of the products manufactured by at least one of the gentlemen in whose business methods it sees so much to admire.

The above is from the *Butchers' Record*, of Allegheny, Pa. It seems almost superfluous to state in response that the products of the gentlemen referred to are already being very extensively experimented upon, not by our analysts alone, but by the people of the whole eastern section of the United States. Our contemporary seems to have gone off on a wrong tack. Just so long as Chicago sends the best beef that is received in the New York and other Eastern markets, just that long the consumers will insist upon being supplied with Chicago beef. It is not our eulogy of one thing, or our condemnation of another, that establishes the marked preference for the best article, which causes our rural friend such worry. The housekeeper demands a certain thing, and the local butcher is naturally only too eager to satisfy that demand. And so long as the consumers and the butchers are satisfied, the traffic will continue in spite of malevolent opposition. Supply us, Mr. *Record*, with something better than "those gentlemen" do, and we will deal with you instead.

CALIFORNIA RAISINS.

In another column of this issue we present an interesting summary of the condition of the grape industry in California. A significant element in the consideration of the subject is the circumstance, that while apparent over-production has caused a partial paralysis in the cultivation of grapes for wine manufacture, the culture of special varieties for raisins is notably on the increase. Many thousand acres have been planted during the past year in grapes adapted to raisins, and many growers are re-grafting their vines to the varieties

most suitable for that purpose. There is scarcely any more striking illustration of the possibilities of the soil and climate of the United States in the matter of fruit raising than is presented in the history of the California raisin industry. Any one who, ten years ago, had predicted its present proportions, and its effect on the Mediterranean fruit trade, would have been counted a madman. But there are some weighty facts in this connection which are gradually being accepted everywhere. An exchange puts them thus: "The Golden State now supplies a very large portion of the United States with this product, and it also gives promise of crowding out the raisin of the Malaga vineyards from the English markets. Within the past few years the California output has increased nearly a hundredfold, and with the enormous acreage that has been planted in the past year or two, which will bear fruit in about three years, it is not unlikely that the importation of raisins into this country will practically cease. It has been demonstrated that the California raisin is of a better quality than that of Malaga. During the past summer the holders of the former were much gratified to find that the domestic article is a better 'keeper' than the imported goods. While the foreign product is liable to 'candy' in the warm season, the domestic raisin is such a good 'keeper' as to lead to the remark that it may be difficult to recognize the new crop raisin from that of last year."

THE FALLACIES OF STATE INSPECTION.

By the preamble and resolutions drafted by the recent so-called convention of cattlemen and butchers in St. Louis, we make the following fair and impartial epitome of the reasons why a State inspection of all cattle which are to be used for meat should be had, because: (1.) The Chicago and Kansas beef dressers have opened retail butchers' shops in various cities. (2.) These dressers have combined to protect their interest. (3.) They have forced butchers to sell Western dressed beef by educating the public to demand it. (4.) The beef dressers being large buyers of cattle, exercise a powerful influence on ranchmen and commission dealers. (5.) They have made such a large and favorable market of Chicago that farmers and cattle raisers prefer to take their cattle to that market. (6.) They have utilized beef suet and cotton seed oil to make a cheap and wholesome butter substitute for the poor man, thus enabling him to avoid monopolistic prices demanded for unwholesome grease butter in States where political demagogues have not passed laws for the protection of these grease butter monopolists. (7.) They have succeeded in getting dressed beef into Eastern markets without paying the prohibitory and discriminating rates of freight imposed upon them by railroads, in the interest of live cattle men, local butchers and Eastern stockyards. (8.) They have by enterprise, industry and economy, acquired a competency. (9.) And whereas (this is the milk in the cocoanut), the members of this convention think they ought to have

exclusive control of the entire meat market, and make out of it all they possibly can. Resolved, that the various States pass a law prohibiting the sale of all meat within their border, unless the meat so offered has been killed in such State. Of course it was necessary to give a plausible reason for such a law, so it was added that the beef product must be raised above the suspicion of disease. Such laws are clearly unconstitutional, and, even if lawful, would be impracticable. New Jersey meat could not be sold in New York nor New York meat in New Jersey; but the law framers had not thought of such trifles.

METROPOLITAN SLAUGHTER HOUSES.

The Ladies' Health Protective Association of New York in its annual report stigmatizes the condition of New York slaughter houses in the following language: "From the organization of the Association a gigantic nuisance, scarcely second to the manure cartage and dumping ground, confronted it, viz., the slaughter house system—if it can be called such—where each corporation is a rule unto itself. The committee found every rule of the Board of Health for the protection of the community openly and constantly violated. The unsanitary, brutal and filthy methods of these slaughter houses have been fully described in former reports. Of the large numbers of these establishments for furnishing meat for this great city, not more than one or two could be found that were carried on with any regard to sanitary or even decent methods."

ELECTRICITY AND LIGHT.

In a very interesting discussion of the modern view of electricity, recently published, Prof. Oliver Lodge says that light is an electrical disturbance, and that light waves are excited by electrical oscillations. Our present system of making light artificially, he characterizes as wasteful and ineffective. We want a certain range of oscillation—between 4,000 and 7,000 billion vibrations per second. "Perhaps, speaking theoretically," comments the *Electrical Review*, "this is sound reasoning; but practically, we don't see how anything that serves a purpose as well as we have learned to serve it can be wasteful, nor how, when a thing is accomplished satisfactorily and thoroughly, as thoroughly as we can appreciate it, can be called 'ineffective.' It must be effective because it succeeds, and must be regarded as economical, at least until we find a cheaper means."

DRESSED BEEF.

The magnitude of this interest can best be judged from the following figures: Messrs. Swift & Company sold in New York, for the week ending Dec. 1, 2,152 carcasses of beef, average 688, at 6.18 per lb. At the

same place for the same week 2,432 mutton carcasses, average 47, at 7.55 per lb., and for the succeeding week the following figures are given: 2,514 beef carcasses averaging 671 lbs., at 6.33 per lb.

SPECTACLES IN SURGERY.—Spectacles to be used in surgical operations, lit by means of a small electric lamp, are a new invention. The lamp is arranged to send a beam of cool light on the part to be examined; meanwhile the rims of the spectacles exclude the outside light from the observer's eyes. The current is conveyed to the lamp by wires connected to the small terminals.

LACTOPEPTINE.

The most important remedial agent ever presented to the Profession for Dyspepsia, Vomiting in Pregnancy, Cholera Infantum, Constipation, and all Diseases arising from imperfect nutrition.

Lactopeptine precisely represents in composition the natural digestive juices of the Stomach, Pancreas and Salivary Glands, and will, therefore, readily dissolve all foods necessary to the recuperation of the human organism.

CAUTION

We regret that we are compelled to caution the profession in prescribing Lactopeptine, but very careful investigation has proven to us clearly the necessity of it. Substitution of cheap and worthless compounds are being made in many cases where Lactopeptine is prescribed.

Lactopeptine is always UNIFORM, and its effects are SPECIFIC, and no one has ever been able to imitate its digestive value. If you do not obtain positive results when you prescribe Lactopeptine, you can be sure that some substitution has been made, and in such cases it may be necessary for the physician to prescribe Lactopeptine in the original ounce package to insure certainty of obtaining the genuine article. We can confidently make this assertion, knowing the scrupulous uniformity in digestive value of every ounce of Lactopeptine.

Lactopeptine has always been kept strictly in the hands of the Medical Profession, never having been admitted in any publications but Medical Journals. It is prescribed by the most intelligent and educated physicians in all parts of the world, and there are but few physicians who have ever used Lactopeptine that will not agree with the late Prof. L. P. Yandell, when he says: "Lactopeptine is one of the certainties in medicine, and in this respect ranks with Quinine."

In the various forms of Dyspepsia, in vomiting in Pregnancy, and in Mal-nutrition of children, there is no known remedy so positive in results.

P. O. Box 1574. **THE NEW YORK PHARMACAL ASSOCIATION, NEW YORK.**

THE CIGARETTE ABOMINATION.

A VOICE FROM SAN FRANCISCO UPON CARBON-MONOXIDE
AND HÆMOGLOBIN.

There seems to be in the human economy an imperative demand for either stimulants or sedatives. Indeed, the use of one requires the other. If the use of tobacco or any other narcotic depresses the nervous system, there needs a stimulant to restore the equilibrium, and *vice versa*. The demand for and the use of tobacco has increased remarkably during the last decade, until now it has become almost universal in our country. It is estimated that of one thousand men, nine hundred and fifty use tobacco. Cigar-makers say that the year 1888 has been the most prosperous of any year in the history of the trade in this State. There are 300 cigar factories in this city which employ 5,000 workmen. About 175,000,000 cigars and fully 6,000,000 cigarettes have been made, whose value is placed at \$800,000. Besides this, the importations from the East will possibly increase the amount consumed of cigars and cigarettes by another million. If it were possible to estimate the depression of the nervous system, and the loss of heart power produced by the narcotine and the carbon-monoxide, in terms of pounds, we might be able also to estimate the quantity of alcohol needed to restore the normal standard. That good tobacco, used in moderation and at the time when the circulation and nervous action are increased (as after eating), can do little harm, may be conceded, but the trouble arises from the fact that tobacco and alcohol are taken at all times, without regard to the physical or nervous condition and when the accommodating or eliminating power of the system is feeble. As with many other things, the harm from tobacco or alcohol lies not in *use*, but in *abuse*, and the results of this abuse may be found in the enfeebled condition of the nervous system. But while we condone the modern use of good tobacco, we have no words of condemnation strong enough for the use of the cigarette, that abomination of the present day. The contents of the cigarette is generally found to be of imperfectly prepared poor tobacco, in which is a large quantity of nicotine, strongly impregnated with opium, stramonium, or belladonna, while the wrapper is the ordinary quality of paper, whitened by arsenic. The use of this must surely create in the smoker a habit of using opium. Aside from these adulterations, the evil of cigarette smoking arises from the inhalation of the carbon-monoxide, which is so extremely poisonous on account of its strong affinity for the hæmoglobin of the blood. Almost all cigarette smokers inhale and force through the nasal passages the smoke; the narcotine and carbon-monoxide is absorbed by the delicate membrane and produces its effects on the system. No stronger argument against this method of smoking could be found than in the numberless cases of broken down nervous systems among our boys and young men. We have seen many instances of "tobacco heart" among boys of twelve or fifteen years. The presence of amblyopia, which is substantially an affection of the optic nerve, is becoming more prevalent, and is due to the inhalation of tobacco smoke. A celebrated physician declares that he can name seventy different diseases, some of them incurable, which are the result of the use of tobacco. This may be an exaggeration, but it is absolutely certain that many an obscure affection of the nervous system is the result of its abuse. While we deprecate the excessive use of tobacco in adults, we condemn utterly its use in growing boys. The evil effects are already showing themselves, and in a very few years we shall hardly find room in our asylums for feeble-minded youth. It behooves every father of boys to put a stop at once to the practice; and since the State has an interest in the health, both moral and physical, of its future citizens, we believe that some enactment by the legislature to forbid the sale to, or use of cigarettes by minors, would be looked upon with favor. It is the duty of every family physician to explain to those over whose health

he has supervision the evil consequences of the use of cigarettes by their children. It is the duty of the medical, secular and religious press to denounce the use of tobacco by minors. Will they do it?—*Pacific Record*.

COTTON SEED AND ITS USES.

PROFITABLE UTILIZATION OF A FORMERLY DISCARDED
PRODUCT.

The cotton seed which of late years has been put to such profitable uses is steadily increasing in popularity. Heretofore the seed after being taken from the cotton boll was thrown away, but now it is about all put to use and readily sold. From this valuable seed is extracted the much used cotton seed oil, and from the residuum are obtained cotton seed meal, cotton seed bran, and cotton seed hull ashes. The seed after being taken from the cotton gin goes through a "linter machine," which takes off the short staple cotton which the gin does not remove. This short staple cotton is sold mostly to concerns who use it for cotton batting. It is also used for other purposes. After all the fibre is taken off, the bare seed is cracked and the kernel is separated from the hull. The kernel is then ground and put under severe heat or cooked. In the heated state the most oil can be extracted, and it is therefore put into a large iron caldron and is subjected to a heavy pressure. When thoroughly pressed, the residue or meal is in the form of cake. Cotton seed oil is used for numerous purposes, and it is displacing other popular oils, owing to its cheapness and healthfulness, as it is purely a vegetable oil. This variety of oil is used very largely by lard manufacturers, who adulterate their lard with it. Although most people would prefer pure lard, it is claimed that the cotton seed oil adulterated with the hog fat lard improves the quality of the stock. The hog lard contains more than twice as much water as the seed extract, and consequently one pound of adulterated cotton seed oil lard goes much further than the pure stock. Large quantities of the seed oil are yearly shipped from this country to the countries on the Mediterranean where olive oil is produced. It is used almost wholly there to adulterate the olive oil, which is then sold both in this country and in Europe as olive oil from the Mediterranean countries. Most of the sardines are now packed in this new oil, and it proves to be successful. Bakers also buy barrels of the liquid, which they advantageously use in substitution for the more costly lards and greases. Chemists and druggists use considerable also. The white or refined stock is used to quite an extent in the Pennsylvania coal mines for lamp oil. Although the cost is much higher than that of petroleum, the safety of the variety is preferable to the more explosive kerosene. The crude stock is used extensively in the manufacture of soap, as is also the foots or residue left after the oil is made. As above stated, after the oil has been abstracted from the kernel, the caked meal is left as a residue. About 150 mills which utilize the cotton seed use both products, the oil and residue or meal. Most of the residue is sent to England in cake form, where the farmers crack it and feed their cattle with it. A large amount has been satisfactorily used in the West, and now it is being sold in this market, it is claimed, quite successfully. This meal is claimed to excel all others as a feed for cattle. That used in this country is not in the cake form, but ground, and now brings from \$26 to \$26.50 per ton. Last year the prices ranged from \$23.50 to \$24 per ton, the advance being caused by an unprecedented foreign demand. Cotton seed meal is not only claimed to be better, but also cheaper than other meals. In St. Louis there is situated a mill which makes cotton seed bran from the hulls, and claims that it is superior to other coarse feed and costs much less, bringing about \$21.50 per ton. Most of the mills burn the hulls of the seed for fuel and sell it for fertilizing purposes. These ashes are bought by farmers in conjunction with the meal and mixed by them for fertilizer. This mixture is said to contain an abundance

of potash and phosphoric acid, which have very powerful fertilizing properties. The ashes are worth from \$30 to \$32 per ton. This fertilizer is not exported, but used here, in this country mostly in the Connecticut valley, by the raisers of tobacco. The supply is limited, and dealers say they could have sold twice as much if they had it.—*Commercial Bulletin*.

THE CHALK CURE.

A NEW METHOD OF TREATING CONSUMPTION.

A German physician, Dr. Louis Halter, having observed that workers at the chalk kilns in his country do not suffer from phthisis, deduced from this the theory that the high degrees of heat to which these laborers were subjected was the cause of their immunity. The workmen are exposed once or twice daily from ten to thirty minutes to an intense heat, the bodily temperature being raised sometimes as high as 160 deg. Fahr. with consequent increase in pulse and respiration, diaphoresis and rapid tissue changes. They drink very large quantities of water and considerable alcohol. Dr. Halter says that the temperature of air in the lungs is normally about 100 deg. Fahr., which is that most favorable to the development of the tubercular bacillus. If the inspired air be raised to the temperature of say 113 to 122 degs. the lungs will be heated beyond the point favorable to the growth of the bacillus. The practical applications of this theory as proposed by Dr. Halter are hot baths, inhalations of dry air of a high temperature, and the addition of antiseptics to the hot air when desired. Forced inspirations are interdicted and inhalations are made through the mouth only, as the nerve terminations in the nose are too sensitive to bear the heat.

Independently of Dr. Halter, an American physician, Dr. Weigert, residing in Berlin, has been making experiments in the same direction. He finds that the tubercle bacillus dies outside of the body at a temperature of 106 degs. Fahr., and is unfavorably affected by one of 100 degs. Experiments have been made on patients beginning at a temperature of from 104 to 140 degs. Fahr. and gradually raising it as high as 176 degs. The air was perfectly dry and the patients bore it well, continuing to inhale it for from three to four hours a day for a month. The general effects are represented as having been remarkable, the patients becoming quite robust; and the bacilli in the sputum which had been very numerous, rapidly diminished in number and finally altogether disappeared.

It had been suggested by one commentator that perhaps the chalk dust might have something to do with the immunity of the laborers, but Weigert's experiments seem to show that if there is anything in the new treatment, hot air is alone to have the credit of it.

Both Halter and Weigert use dry air; Krull, another experimenter in the same line uses moist air, his work ante-dating that of the other observers named, and favorable results have been reported by him also. So the idea is not wholly new, but is very philosophical.

CIGAR-MAKERS.

HOW THEY WORK AND EXIST IN NEW YORK.

Our sprightly young contemporary, *The Metropolis*, in its issue of last week, published a very instructive description of the experiences and struggles for existence of the cigar-makers in this city, from which we condense the following:

Over 30,000 men, women and children are employed in the tobacco industry of this city, of whom about 16,000 are cigar-makers proper, the rest being cigarette-makers, strippers, bunchers, packers, pasters, box-makers. More than 6,000 cigar-makers are women, girls and small children. Some branches of the trade are almost monopolized by girls. For instance, the making of cigarettes. The nationalities which predominate

among the cigar-makers are the Germans, Bohemians and the English; but there are also quite a number of Poles, Hollanders, Cubans and Hungarians, with a sprinkling of Spaniards, Americans, French and Russians. The best cigar-makers are the Germans and Bohemians; the Cubans and Spaniards rank next. The Poles are ruining the trade here by cheap work done in basements in Division Street and its neighborhood. They work, as it is termed, "below zero," just as the Chinese are doing in San Francisco. The Cubans and Spaniards make a special grade of goods called "Spanish work." Cigar-making has of late years become so unprofitable to the working people, that the average weekly wage ranges only from \$6 to \$7. Even the best workers, making cigars by hand, average only \$15 per week if working full time all the year round on first-class material; but this fortunate class comprises hardly fifteen per cent. of all cigar-makers. The poorest class of workers average only \$5.50 per week, and therefore their wives and children must help by their work to swell the income of the family. The working time is about eight hours a day—a result of their strong organization. Eleven manufacturing firms own tenements in this city in which they house their workers under the so-called tenement-house cigar-making system. These mean firms keep the tenement horror alive by employing 546 entire families. Counting at the lowest estimate, five working members to each family would give us the correct number of tenement-house cigar-makers, viz., 2,830. Each family has either two or three rooms, small, poorly ventilated and dark. In these accommodations they have to pay \$3 more for their monthly rent than they would if they were allowed to live where they like. But—and here the fine game of the cigar manufacturing landlord comes in—no rooms, no work, *S.*, these poor people have only the alternative to accept low wages, high rent and long hours of work (fourteen hours daily on an average) or walk the streets and starve. In these houses, which cannot be called homes, one finds the greatest filth, misery and degradation imaginable. To sensitive persons a description of the horrors would be insupportable. It is happily true that "one-half the world does not know how the other half lives." Cannot these conditions be amended or abolished? For years the cigar-makers have banded together in unions to suppress this terrible, inhuman system. Some headway they have made in their endeavors—for which they have been called conspirators and revolutionists. If American workmen were obliged to live in this manner they would have been revolutionists long ago. There are 1,800 cigar factories in New York City. Of these the great majority employ from one to fifty hands each. Large factories, of which there are 350, employ from 50 to 500 hands, while the largest class of factories, of which there are only ten, employ from 500 to 1,000 hands. The vital statistics gathered in the course of years by some organizations show that among the cigar-makers lung troubles are of common occurrence. Women must frequently stop work to recuperate from the bad effects tobacco has upon them. There is another danger which threatens the cigar-makers and promises to thin the ranks already thinned by competition among themselves. Last year bunching machines have thrown 400 persons out of work. Yet cigar-making machinery is only in its infancy. In the opinion of many cigar-makers, the trade is leaving New York City and will never be as good and prosperous as it was in past years. New York is fast losing its former prestige by manufacturing cheap cigars in too great quantities. Since 1864 the cigar-makers have made determined efforts to organize themselves and through organization to better their condition. They have succeeded in accomplishing a great amount of good to their craft. The Cigar-makers' International Union of America has been in existence for thirty-five years. The number of its members is very large and probably exceeds 25,000. Of the cigar-makers in this city about 8,000 are organized. They stick to their organizations faithfully and are among the best, most intelligent and

most energetic workingmen. Since 1879 the International Union has paid out for strike benefits \$369,833, for sick benefits \$182,425, for death benefits, \$21,843, and for traveling benefits \$196,882. The present fund in its treasury amounts to over \$253,000. The powerful agitation for the suppression of the tenement-house system has resulted in greatly mitigating that evil. Their union label is an effective weapon against unfair employers and has brought many of them to terms. At present it is used by 386 manufacturers in this city alone, who have to observe certain rules of the union for the privilege of using it. Manufacturers who sell tenement-made goods are debarred from its use.

GRAPE CULTURE IN CALIFORNIA.

STATISTICS OF THE PRODUCT IN 1888.

The daily papers of San Francisco have, in summing up the commercial interests of the State, devoted considerable space to the wine industry. A summary of the statistics furnished shows that, while the production of the vineyards was not so great as had been expected early in the season, the total yield during the past year was 17,000,000 gallons—an increase of a million gallons over the previous year. At the beginning of the season the vines gave evidence of producing a very large yield, and in August it was estimated that the production would be 21,000,000 gallons. After that, however, the State was visited by two weeks of hot weather, followed by rain, with the result of a diminution of at least one-fourth of the crop. Of this amount, at least 4,000,000 gallons will be distilled, producing about 600,000 gallons of brandy. The balance of 13,000,000 gallons will consist of dry and sweet wines. During the past year over 7,000,000 gallons have been exported, and there was a home consumption of five or six millions. It will therefore be seen that there is no over-production at the present time. The total shipments of wine, the value of which is approximated at 40 cents a gallon, from San Francisco, were 7,170,634 gallons, and of brandy 428,135 gallons. The shipments in 1887 were, wine, 6,901,771, and brandy, 472,452 gallons. The heaviest shipments to one port were to New York, where 3,002,568 gallons of wine and brandy were sent. The shipments to the same place in 1887 amounted to 1,688,227 gallons. In 1887, 258,248 gallons were shipped to foreign ports, while the shipments last year increased to 398,879 gallons.

Regarding the condition of the vineyards, the *Alta* remarks that the planting of wine grapes has been very light during the past two or three years; the large increase in the production of wine, which so many have predicted, will not occur. With the vines now planted and in bearing, a very large crop in a favorable year would be 25,000,000 gallons. In all favorable years with wet seasons, there is always liable to be heavy spring frosts, which cut off the crop considerably in the bay counties. During dry seasons the vines in the interior counties suffer from sunburn, and the result is that the large crops expected fall far short. The reason that few wine grapes were planted during the last two years is due to the low price of fresh grapes and wines. The prices of wine grapes in most counties has averaged from \$8 to \$15 a ton for ordinary kinds, and from \$20 to \$30 for fine varieties, such as Cavernates and Sauterne. The prices of low wine of the '87 vintage were higher in the early part of the season than in the latter part of the year. In January, dealers were paying from 16 to 20 cents a gallon for good wine. In July the ruling quotations ruled from 12 to 15 cents. When it was discovered that the vintage of '88 would not be a heavy one, prices again arose, and dealers are now paying from 18 to 25 cents a gallon for '87 wines. The past two years have been very hard ones for viticulturists, owing to the low price of grapes and wines, but the future looks brighter than it has for some time.

The exports are steadily increasing, and, as the planting of vines has comparatively stopped, the consumption will soon exceed the production. When that time comes, vine planting will again be commenced in earnest. Many wine growers have been discouraged, and some are pulling up their vines and planting orchards. By those thoroughly posted on the subject this is considered an injudicious movement, and viticulturists are advised to let their vines remain if they only clear expenses at the present time. The raisin growers, however, have been making handsome profits for the past few years, and the result is that a great many thousand acres of raisin varieties have been planted. Many growers are grafting over wine grapes to the Muscat varieties for raisin culture. The table grape industry has flourished for the past two years, owing to the demand for fresh grapes in the Eastern States, good shipping grapes bringing from \$30 to \$50 per ton. Owing to the dry season, the table grapes last year were not as large and showy as they were in former times, and the prices realized in the East were not as good as in previous years. Before vintage time, when prices of grapes were very low, the Viticultural Commission advised growers to dry their grapes. Those who followed the advice were well satisfied. A few thousand tons of dried grapes were produced and sold at 2½ and 3¼ cents a pound—equal to from \$12 to \$20 a ton for fresh grapes. The commission will send some of these dried wine grapes to France and England to ascertain their value in those countries, and the prospects of their market. The drying of wine grapes has been so far successful that it will undoubtedly be carried on to a still greater extent during the present year. Vine diseases have caused great havoc in various sections of the State. *Phylloxera* is still spreading, particularly in counties where it has existed for a number of years. A new disease has destroyed thousands of acres of vines in the southern part of the State. This disease has baffled all experts, and unless checked it will not be many years before all the vines in Southern California are killed. A report of the appearance of this disease in the northern part of the State has not been confirmed. The northern viticulturists, having been warned, are anxiously watching for its appearance. The vines killed by these two diseases will greatly exceed the number planted during the past year.

THE WORLD'S INCREASE.—The population of the civilized world in 1850 was barely 300,000,000, and is now over 422,000,000, having increased 42 per cent. in one generation.

SALICYLATED EGGS.—M. Lambert, the pharmacist to the Bron Insane Asylum, near Lyons, France, has discovered that salicylic acid is being used to preserve eggs. It has been employed in the same way as lime, the users claiming that it did not penetrate the shell. It has been shown, however, that this claim is incorrect, as the acid is soon found in both the white and the yolk. To detect the acid in the white the albumen is to be beaten with a little water, and, on the liquid being acidulated and shaken with ether, salicylic acid may be easily separated and identified by the usual tests. The same process answers for the yolk, but it must be first coagulated by heat to avoid the formation of an oily emulsion difficult to manage.

BENIGNANT BACTERIA.—In a recent communication on the subject of bacteria, Dr. Weibel mentions (*Pharm. Centralhalle*) a class of putrescence vibrios which flourish in offensively putrid matter. As has been very clearly set forth in the new work on "Ptomaines and Leucomaines," by Vaughan and Novy, bacteria induce disease through the production of chemical poisons by the growth of the germ, each specific pathogenic micro-organism producing its own characteristic poison. The office of the particular vibrios observed by Dr. Weibel appears to be the destruction of the offensive products of decomposition upon which they feed, and which they transform into simpler and less offensive combinations. Weibel states that these benignant bacteria have the power of developing in very dilute nutritive solutions where they hold their own with other bacteria, and he thinks it possible that the self-purification of streams may be a result of the activity of these micro-organisms.

CORRESPONDENCE.

THE AMERICAN BUTCHER.

THE TRUE INWARDNESS OF HIS POSITION.

NEW YORK, Jan. 14, 1889.

Editors Analyst.—The butchers of this country are an unusually intelligent class, and like every other class of business men, are carefully looking after their personal interests. Every wise man buys where he can obtain the goods he wants at the lowest price so that he can sell them at as good or better profit as his competitors. If he can find an article which he can honestly sell to his customers as the best of the kind at a fair price and make a good profit, the shrewd merchant does not question as to the locality from whence it comes, nor does he descend to the meanest of all methods, that of allowing sectionalism or blinded prejudices to sway him. It is fair to assume that human nature is alike, and that a business man selling meat is not different from any other merchant. Yet this does not appear to be borne out so far as butchers are concerned, judging from the kind of articles that are printed in the so-called butchers' organs. Either these organs do not represent the butchers' views or the butchers are different from every one else. A brief review of the butchers' so-called organs will, to some extent, clear up this mystery. Nearly every issue of these papers contains a sensational article, based on gross misstatements, from the fertile brain of an individual styling himself Chris. Brokate, Secretary of the Butchers' National Protective Association. If there were no grievances, imaginary or otherwise, there would be no need of any butchers' protective association, and if this association did not exist there would be no well-salaried office for Mr. Chris. Brokate to fill. He would have to go back to earning his daily bread by the sweat of his brow in wielding the cleaver, if he ever knew how. This explains the seeming mystery and also accounts for Mr. Brokate's astounding stories of various mares' nests discovered by him. It is but fair to add that none of the senseless stories related by him with so much gusto, have ever stood the light of a cross-examination before any of the Congressional committees, but when he has had the courage to appear, the stories so glibly told in the butchers' organs, have been considerably toned down by him and then were completely disproven before these committees. Whenever Brokate has been met by any one conversant with the hollowness of his pretensions he has had to resort to low invective, or completely sink out. A further examination of these organs shows that they exchange their canards with wonderful unanimity, quote them, rewrite them, and in various ways ring the changes on them, evidently to impress their readers with the pressing necessity of maintaining these sheets for fear that the "Chicago Big Four" would come some night and gobble up the butchers' organs, butchers, slaughter-houses, meat markets, Senate and House committees, consumers, families, husbands, wives, babies and all. It is horrible to contemplate, but the Pittsburgh butchers seem not to have been frightened, for in one of the Pittsburgh *Advocates'* columns we find this significant wail:

"Our solicitor has been calling upon the butchers lately in the interest of this paper. They have not responded as liberally as they should, in view of the fact that the paper is published in their interest and that our expenses are far in excess of the revenue derived from the Association. We hope the butchers, especially the wholesalers, will give us a little practical encouragement."

The astounding inconsistencies of these papers, who seem to have but one idea, is most remarkable. Wherever they can say anything against Chicago beef, be it true or false, they say it and naturally prefer the false because it is always more sensational. How long will it take so bright a lot of men as the American butchers to see through this little game? CLEAVER.

IMPORTANT TO ELECTRICIANS.

The *Sanitary News* announces that the National Electric Light Association will hold its next meeting in Chicago on February 19 to 21 inclusive. The intention is to present an extensive exhibition of electrical appliances of all descriptions, and arrangements are in progress to extend every possible facility and opportunity to make the exhibit one of great value to all interested in electric light and power. Matters pertaining to this interest will be discussed, and in all probability this meeting, in its scope and value, will be the most important ever held by this body.

THE ETHER HYPOTHESIS.

EXPERIMENTAL PROOFS OF ITS MATERIAL EXISTENCE.

Prof. G. F. Fitzgerald, in his Presidential address before the section of Mathematical and Physical Sciences at the Bath meeting of the British Association, discussed the bearing of the experiments recently made in Germany by Hertz, to prove the material existence of the ether. As the subject is of such vital importance to scientists, a short account of the experiment and its influence may not be without interest. Hertz based his investigations on the modern conception, well set forth in Clerk Maxwell's theories, that electro-magnetic induction must be due to a stress in an intervening medium—the hypothetical ether, and that light and heat phenomena are to be explained on the assumption that they are due to electro-magnetic disturbances of a rapidly alternating nature; that the various phenomena of electric attraction and repulsion cannot be due to an action at a distance, but on the result of action through a medium, since they vary with the nature of the dielectric; that a rapidly alternating current would produce stresses in the supposed ether which would be propagated as waves with a definite velocity. Again, the practical unit of resistance, the British Association ohm, is that resistance which is equal to a velocity of 1,000,000,000 centimetres per second. It follows, then, that the resistance of any conductor is equal to the time required for the passage of a unit of electricity through it, and that conductors have definite time-constants, as stretched strings have definite periods of vibrations. A secondary circuit will thus have the maximum inductive effect produced in it by impulses whose time constant of transmission is the same as its own, just as, continuing our analogy of stretched strings, a string will respond best to impulses which exactly correspond in time to its own. Hertz produced in the primary circuit impulses of an extremely short but definite period—one hundred millionth of a second. The length and resistance of the circuit was so arranged that this gave a wave length of two metres. The secondary or receiving circuit had a short air-space in it. By the inductive action of the primary circuit upon it, sparks were seen to leap across this air-space, the sparks being most pronounced when the circuit was at a distance of two metres, or some multiple of it, from a reflector to the primary circuit. This reflector seems to have been simply a wall of the room. Now, as the action of one string upon another is not an action at a distance, but through a medium—the air, so these results seem to show that the electro-magnetic action must have taken place through a medium. The material existence of the hypothetical medium—the ether—is thus rendered pretty certain. The assumption of a medium such as the ether was a means of co-ordinating the phenomena of magnetism, heat and light. These classes of phenomena seemingly so distinct, and in a sense widely separated, were until late years considered to have very little, or nothing, in common. However, researches in radiant heat and in spectrum analysis showed that heat and light were more closely related, and must both be due to disturbances transmitted by a

medium. A little later on, the close relation in the transmission of light, heat, and electro-magnetic disturbances was demonstrated, and Clerk Maxwell developed his theory of light, that it was due to the action of stresses of a rapidly alternating character in the ether, and that these were similar to the stresses due to electro-magnetic action. As a proof of the correctness of his theory, he showed that the velocity of electro-magnetic impulses in a non-conductor was about equal to the velocity of light. The results of Hertz's experiment seem to prove the correctness of his theory in a striking manner. The admirable train of reasoning which led Maxwell to this theory by clear methods of induction, are comparable only to that masterpiece of inductive reasoning on the part of Adams, which, in 1846, led to the discovery of the planet Neptune. The electro-magnetic theory of light satisfactorily explains why the waves of light and heat have transverse rather than longitudinal vibrations. It remains for careful investigation to accurately ascertain the nature and property of the ether, and to reconcile some contradictory conceptions which demand that it have such high rigidity and elasticity, when its density is almost unthinkably small when compared with water. Scientists may now congratulate themselves upon their courage in adhering to the conception of an all-pervading medium, such as the ether, in spite of the jeers of certain metaphysicians, because they were ignorant of its possible structure and many of its laws. From the results of this and similar experiments we may look for a great change in text-books on the subject of attraction. They will treat the attraction of gravity and attraction in general, as due to stress in the ether and not to action at a distance. The immense gain in clearness to the beginner will be appreciated by those who remember how they struggled over these knotty points in the outset of their scientific studies. Then, too, the various, and to some extent often inexplicable, manifestations of chemical affinity may be explained and co-ordinated by being proven to be a form of ether-stress. We may confidently look to inventive genius to discover some means of utilizing the energy of the different forms of ether-stresses, and the ether-engine may not after all be a dream. The subject is at least fascinating and promising and may give us a key to the solution of that important scientific and commercial problem—how to utilize the solar energy directly as a motive power.—*Prof. W. M. Stine in Pop. Sci. News.*

PHILADELPHIAN—I wish you, sir, to observe the color of that water I have just drawn from the pipes. Councilman—Oh, that is all right. The color is not due to impurities, but to the air in the water. "Air?" "Yes, you see, as the limpid streams which enter the Schuylkill go leaping and bubbling and singing through their mountain glens the soft, brownish Indian summer atmosphere permeates the liquid, and gives it that pleasing, poetic, terra-cotta hue."—*Philadelphia Record.*

GEORGIA HEALTH BOARD.—Dr. Sims, member of the Georgia Legislature from Lincoln, has in course of preparation a bill creating a State Board of Health. The bill will provide for a board consisting of five physicians in good standing, who will have charge of the quarantine regulations of the State, without, however, clashing with the authority of the local boards. One result of the creation of a State Board of Health will be to make uniform the quarantine regulations. The friends of the measure believe that the presence of a State Board will do much to allay the excitement incident upon epidemics.

ELECTRIC PROSTRATION.—Several cases of the peculiar malady, electric prostration, are reported from France. It effects workers under electric light. The light exceeds 100,000 candle power, and it would appear that it is this excess of light, and not the heat, which produces the nervous symptoms. A painful sensation in the throat, face, and temples is first noticed, then the skin becomes coppery red, and irritation is felt about the eyes; much lachrymation ensues, and these symptoms then disappear, while the skin peels off in five days. The effects are comparable to those produced by walking over fresh snow in the sunlight.

WHAT BEEF COSTS.

THE PROFITS OF THE RETAIL BUTCHER EXHIBITED IN
DETAIL.

The subjoined article, which appeared in the *AMERICAN ANALYST* of January 10th, has attracted such wide attention and has evoked such numerous orders for copies of the issue containing it, that in order to meet the demand we feel constrained to republish it:

The question has frequently been asked why it is that when the newspapers quote the wholesale price of beef at from four to seven cents a pound, the consumer is compelled to pay as much as twenty or twenty-three cents a pound. To answer this question intelligently the *AMERICAN ANALYST* detailed one of its staff to make the necessary inquiries, and we give herewith the itemized results. A carcass of beef, weighing 750 lbs., cut into loins, rounds, chucks, ribs, plates, shanks, flanks, kidneys and necks, will make the following product, at the retail price stated. The average wholesale

price of such a carcass in New York is seven cents, or \$52.50 for the carcass, which, when retailed, as shown by the table subjoined, would make \$92.12, or a profit of \$40.62 upon an investment of \$52.50, which would certainly appear to the outside observer as a pretty good profit to the retailer. It is true that from this profit must be deducted the expenses of the retailer's business; but nevertheless, it also proves conclusively that the retail butchers have no grounds for complaint against the Chicago dressed beef men, nor can the public have unless it is that the prices of meat at retail stores are as high as they were when cattle sold at higher prices; but the remedy for this should be demanded of the retailer, whose prices have not been reduced in proportion to the wholesale price. We may add here that the retail prices given are the lowest prevalent, and where there is any variation, it will be found that the prices demanded by retail butchers are somewhat higher. In any case, it should be borne in mind that as for quality Chicago dressed beef is always the best, having the advantage of more careful selection, better dressing, and consequent tenderness.

cheese. Now who is so desirous to eat cheese, must eat it after other meate, and in a little quantity. A penny-weight according to the old saying, is enough; for being thus used it bringeth two commodities—first, it strengtheneth a weak stomach; secondly, it maketh other meates descend into the chief place of digestion; that is the bosom of the stomache, which is approved in 'Schola Salerni.' But old and hard cheese is altogether disallowed, and reckoned among those ten manner of meates which engender melancholy, and bee unwholesome for sick folks, as appeareth before in the chapter of Beefe."

COFFEE DECEPTIONS.

HOW COFFEE IS IMITATED IN GERMANY.

Our foreign exchanges frequently report the detection of food imitations, exhibiting considerable ingenuity of contrivance. The following two samples are reported by J. Konig in the *Zeitschrift für angew. Chemie*, No. 22:

Staining Coffee Berries.—Berries are often roasted with addition of roasting syrup, which unsavory article the author found to consist of: Water, 26.21; fermentable sugar (dextro-glucose), 45.80; unfermentable bodies and dextrin, 37.45; ash, 0.54. Its use is said to be in preserving for a long time the delicate aroma of the berries; but, according to the author, it really constitutes a fraud. Not only does it make the coffee decoction look stronger, but it enables the roasted berries to hold about 7 per cent. more water than they otherwise would.

Artificial Coffee Berries.—A sample submitted to the author for analysis looked very much like the real article, only the berries had all precisely the same shape, which is not the case with the genuine product. The result of the analysis was as follows: Moisture, 5.14; nitrogenous matter, 10.75; fat, 2.19; non-nitrogenous matter, 76.76; woody fibre, 3.96; matters soluble in water, 29.88; ash, 1.20. Microscope revealed wheat starch. The berries, therefore, consisted, no doubt, of roasted wheat flour dough of low quality. They are eagerly bought by retailers, and afterward mixed to an extent of sometimes 50 per cent. with genuine berries.

FRETTING.

A FOOLISH WASTE OF ONE'S OWN AND HIS NEIGHBOR'S
COMFORT.

There is one sin which it seems to me is everywhere and by everybody underestimated, and quite too much overlooked in valuations of character. It is the sin of fretting. It is as common as air, as speech—so common that unless it rises above its usual monotone, we do not even observe it. Watch any ordinary coming together of people, and see how many minutes it will be before somebody frets—that is, makes more or less complaining statements of something or other, which most probably everyone in the room, or the car, or the street corner, as it may be, knew before, and which most probably nobody can help. Why say anything about it? It is cold, it is hot, it is wet, it is dry; somebody has broken an appointment, ill-cooked meal; stupidity or bad faith somewhere has resulted in discomfort. There are always plenty of things to fret about. It is simply astonishing how much annoyance and discomfort may be found in the course of every day's living, even at the simplest, if one keeps a sharp eye out on that side of things. Even Holy Writ says we are born to trouble as the sparks fly upward. But even to the sparks flying upward in the blackest smoke, there is a blue sky above; and the less time they waste on the road, the sooner they will reach it. Fretting is all time wasted on the road.

ANTIQUITY OF CHEESE.

ITS OCCURRENCE IN SCRIPTURAL AND CLASSICAL LITERATURE.

Cheese and curdling milk are mentioned in the Book of Job. David was sent by his father, Jesse, to carry ten cheeses to the camp, and to see how his brethren fared. "Cheese of kine" formed part of the supplies of David's army at Mahanaim during the rebellion of Absalom. Homer makes cheese form part of the ample stores found by Ulysses in the cave of Cyclop Polyphemus. Euripides, Theocritus, and the early poets mention cheese. Thomas Coghlan in "The Haven of Health," 1584, says: "What cheese is well made or otherwise may partly be perceived by an old Latin verse translated thus: 'Cheese should be white as snow is, nor full of eyes as Argos was, nor full of spots as Lazarus, nor old as Mathuselah was, nor rough as Esau was.'" Master Tusser, in his book of Husbandrie, addeth, "other properties also of cheese well made which whose listeth may read. Of this sort, for the most part, is that which is made about Bambrurie in Oxfordshire; for of all the cheese (in my judgment) it is the best, though some prefer Cheshire cheese made about Nantwich, and others commend more the cheese of other counties, but Bambrurie cheese shall go for my money, for therein (if it be of the best sort) you shall neither taste the rennet or salt, which be two special properties of good

AIDS TO SIGHT.

THE NECESSITY AND RESPONSIBILITY OF WEARING
GLASSES.

There still exists quite a prejudice in the minds of many against the use of glasses. This prejudice is not wholly confined to the laity, but is shared by many excellent physicians. It is due principally to the ill effects of poorly adjusted glasses, and partly to a lack of knowledge of the fact that if glasses are needed, it is altogether possible to learn what ones are needed, and to so adjust them as to be a benefit to the eyes and in every case to avoid doing injury. By far the greater number of glasses that are now worn are fitted by the individuals who wear them, that is to say, a man concludes he needs glasses and proceeds to an optician's store and selects a pair that he thinks suits him. It is needless to say that persons under forty years of age run some risk by so doing. Neither is it altogether safe for those over that age, though if the difficulty be only a loss of accommodation or power to see objects at a short distance from the eyes, then a serious mistake is not likely to be made. Some opticians assume the responsibility of fitting any and all cases that apply to them. As well had the druggist essay to treat all cases of diseases that may apply to him for medicine. Quacks play no little part in lessening the confidence of the people in the efficacy of properly adjusted glasses. They know but little

or nothing of the eye and its needs, and it but too often happens that the patient could have done better in fitting himself. Unquestionably, the necessity for wearing glasses is becoming much more common than formerly, and the reasons for this are very apparent. All eyes that are not myopic (near sighted) are in active service at all times, except when they are closed or fixed upon an object that is twenty feet or more distant. It is easy to imagine how little rest the eye gets during the day, when its owner lives in a city. The varieties of employment in which the eyes are brought into constant and unremitting use during the entire working hours of the day, are rapidly increasing. Such work makes manifest many minor defects of vision that would pass entirely unnoticed but for the severe tax on the eyes. Never before has reading formed so important a part in the lives of so many persons as now. As civilization advances the demands for acute vision must increase. It is not generally known that it is the exception and not the rule to find eyes that are perfect in shape. It does not follow, however, that all eyes that are not perfect in shape should have glasses fitted to them. The purposes for which they should be prescribed are, first, to prevent disease of the eyes from "eye-strain;" second, to aid in the cure of certain diseases by giving the eyes rest; third, to enable the patient to better pursue his avocation in life, and, fourth, for his comfort. As a rule, spectacles add nothing to the appearance of the wearer, and they are always a source of inconvenience. Unless there is a definite object to be attained by their use, patients are better off without them. Nearly every case of myopia should be corrected with glasses. Other errors of refraction should be corrected only when they interfere seriously with vision or give rise to disease or decided discomfort to the patient. The degree of error bears no definite relation to the necessity for correction.

—*Med. Review.*

THE DEADLY CIGARETTE.

ITS EFFECT UPON BOYS.

Says the *New York Medical Journal*: "In an experimental observation of thirty-eight boys, of all classes of society and of average health, who had been using tobacco for periods ranging from two months to two years, twenty-seven showed severe injury to the constitution and insufficient growth; thirty-two showed the existence of irregularity of the heart's action, disordered stomachs, coughs and a craving for alcohol; thirteen had intermittency of the pulse, and one had consumption. After they had abandoned the use of tobacco, within six months one-half were free from all their former symptoms, and the remainder had recovered by the end of the year."

A TERRIBLE WARNING.

Henry P. Hatcher, son of Florist J. C. Hatcher, of Amsterdam, N. Y., is threatened with blindness from the effects of excessive cigarette smoking. The left eye is affected and he cannot see.

SPONTANEOUS COMBUSTION.

THE PHENOMENON ATTRIBUTABLE TO ADIPOSE DISPOSITION AND NOT ALCOHOLISM.

That increased combustibility does exist cannot be denied, though at first sight it is not so clear to what it owes its existence. In the doctrine that increased combustibility in bodies is due to excess of fat, Dupuytren has advanced the only explanation capable of setting the subject at rest, and on a true basis explaining rationally and philosophically the cases of so-called "spontaneous combustion."

When we consider the amount of fat some bodies contain, the subject grows even clearer, and a review of the cases demonstrates that the incineration was always most extensive in the skin and subcutaneous adipose

tissue, and other places where fat is abundant, and least marked in organs and regions with less fat. The fatty degeneration of various organs and structures, the intermuscular and subcutaneous adipose tissue, along with the masses deposited on other parts of the body, all present a body of oleaginous matter amply sufficient to account for the combustion, and which, when once ignited, would tend rather to burn *in situ* than to flow out, thus explaining the greater destruction of the corpse than of objects in the vicinity.

Regarding the influence of alcoholic indulgence in these cases, it has been conclusively proved that tissues soaked in alcohol do not burn more readily than others not so treated, and it is only as a stuporifying agent, and in its tending disposition of fat in the body, that alcohol aids in increasing its combustibility.—*Cin. Med. Times.*

THE WEEKLY ANALYST.

HOW THE NEW PLAN IS GREETED BY THE PUBLIC.

(*San Francisco Commercial Record*, Jan. 10.)

The ANALYST has commenced the year by making its appearance as a weekly instead of a semi-monthly journal. In this more frequent issue it will greatly increase its laudable power of exposing the frauds that exist in the adulterations of food and many other products. We wish it a largely increased circulation.

A BURNING SHAME.

SUBVERSION OF THE NEW YORK PUBLIC SCHOOLS TO THE INTERESTS OF POLITICAL SPOILSMEN.

The following pointed and truthful statement of the situation is from *Science* of January 18:

We have frequently had occasion to comment upon the condition of the New York City schools during the past year. This condition, and the influences that are at work in them, have far more than local interest. At the organization of the Board of Education for 1889, which took place last week, the controlling influence of the political machines was again made manifest, and those who had hoped for some improvement in this respect were bitterly disappointed. Two members of the board, who had expressed themselves publicly as in favor of a change, deserted their colleagues at the critical moment. The most contemptible and discreditable political methods had been used to bring this result about, and it again places in the president's chair the man whose previous course we so thoroughly disapproved of in our comments at the time of the contest of last spring. It is a serious matter, also, that the great city newspapers either keep their readers in ignorance of what is going on or else endeavor to have them sympathize with it. It is the simple fact that the New York City schools to-day are in the hands of the political spoils-men, and they use them to provide places for themselves and their friends, and to perpetuate abuses from which they derive personal benefit. From the president of the Board of Education and the superintendent of schools, down to the very janitors, there is a mass of intrigue and chicanery which is a disgrace not only to the city of New York, but to the country.

ICE FAILURE.—The ice crop apparently promises to be short all around. Even Duluth and the dwellers on the line of the Northern Pacific Railroad find the weather so capricious that land and water are alike disappointing. The other day it was wheat failing, now it is ice. In the Puget Sound region they have been obliged to adopt artificial methods of congelation to procure the necessary supply in ordinary seasons. Both Seattle and Port Townsend have factories of ice. The great and growing city of Tacoma gets its supply by rail from Idaho and Montana, where Nature's ice-house is never empty. What would be thought of supplying New York by rail from the Rocky Mountains? In the event of a real ice famine such a thing would be within the possibilities.—*Boston Transcript.*

ANOTHER WONDER.

DIAGNOSING DISEASES BY MEANS OF THE PHONOGRAPH.

What will the unearthly phonograph do next, and what realm will it not lay under contribution to its weird power? are the queries continually suggested by its doings and emphasized anew by its recent accomplishments in medical science, as told in the *Medical Record* by Dr. J. M. Bleyer, who has been prosecuting some most interesting experiments with it. He has been using the machine to teach, record, reproduce and demonstrate the physical signs alike of the normal and diseased condition of the heart and lungs; has actually made audible by his phonographic-physical examinations pulsations wholly inaudible to the ear in its non-phonographic state, and has opened up an entirely new field of investigation that cannot fail to be most valuable to the art curative. He obtained these results by attaching one end of a deaf-conversation-like tube to the recording cylinder of the phonograph and placing the other end on the part of the chest to be explored, the phonograph being set in motion before making tube contact with the chest. Thus every part was examined, the anatomical name of each being registered on the phonogram by speaking its name into the phonograph, and the different physical sounds were recorded by pulsation. In the reproduction of all the sounds and speech, their varied tones and pitch were given with perfect clearness, a direct attached stethoscope being applied to the physician's ears from the phonograph. With some extra experimenting, he was able to apply the use of the machine in such a manner as to throw the registered physical sounds into the auditorium, and so teach directly a larger class. This is all actual fact, not romance, and the time will doubtless come when no physician "in good and regular standing" will be considered to be fully equipped without a doctor's phonograph.

FLEXIBLE STONE.

A SINGULAR SUBSTANCE FOUND IN NORTH CAROLINA.

The Washington, D. C., *Star* of the 19th says: There lay this morning on the desk of Mr. Samuel Hodgkins, acting chief clerk of the War Department, a stone wrapped in brown paper. It weighed about a pound, and was perhaps thirteen inches in length, two-and-a-half in width, and one-third of an inch thick. The texture of the stone was fine and presented no evidence of stratification, and was smooth over the entire surface. A knife blade made no impression on the particles. There was no doubt as to its being a genuine stone, but it nevertheless possessed the flexibility of a piece of india-rubber. When taken in the hand and shaken in the direction of its flat surfaces, it would bend back and forth with a dull, muffled sound. The movement was more of a laxity in the adhesion apparently than an elasticity. When held horizontally by one end, the other would drop and remain in that position. With the two ends supported on rests, the free centre could be pressed half an inch below the middle line. With one end held firmly on the desk, the other could be bent upward over an inch. The movement was not confined to the one direction—in the plane of the flat surfaces—but the entire stone seemed to be constructed on the principle of an universal joint, with a movement in all directions under pressure. It came from a mountain in North Carolina, and bears the name of "flexible sand stone." The entire mountain is composed of this material, and pieces cut at random exhibit the same flexible properties.

BRASSING SMALL ARTICLES.—To one quart water add half an ounce each of sulphate copper and protochloride of tin. Stir the articles in the solution until the desired color is obtained.

DOMESTIC DIETETICS.

SPECIALLY PREPARED, FROM PRACTICAL TESTS, FOR THE
LADY READERS OF THE "AMERICAN ANALYST."

SEASONABLE FOOD.

January.

MEATS.—Beef, mutton, ham, kidneys, liver, venison, sausage, pork.

GAME AND POULTRY.—Grouse, hare, pigeon, quail, chicken, duck, turkey, rabbit, goose.

FISH.—Bream, cod, crabs, eels, carp, flounder, halibut, herring, lobster, mackerel, mussels, oysters, perch, pike, rock-fish, salmon, smelt, whitefish.

VEGETABLES.—Artichokes, beets, beans, cabbage, carrots, cauliflower, celery, garlic, lettuce, onions, parsley, parsnips, potatoes, shallots, spinach, squash, tomatoes, turnips.

FRUIT.—Apples, bananas, grapes, oranges.

PRACTICAL RECIPES.

LENTIL SOUP.—One pint lentils, two quarts cold water, celery tops, one or two whole peppers, two or three ounces of ham, half an onion. Soak the lentils for two hours. Put them on the fire with the water and other ingredients. Boil three hours, adding more hot water if the quantity is reduced too much by boiling. Remove ham, onions and celery. Rub lentils through a sieve, return to soup, stir well and season and serve.

LIVER AND BACON.—Cut the bacon in slices first, then cut each slice into squares. Wash the liver thoroughly and parboil, or rather scald it, and cut it in slices of the same size as the pieces of bacon; put them alternately on wooden or silver skewers, and broil on all four sides. When done do not remove the skewers. Serve with a sauce of melted butter seasoned with lemon juice.

SWEET POTATO CROQUETTES.—Eight potatoes, four ounces butter, four tablespoons cream, salt and pepper. Bake the potatoes with skins on; scoop out and mash fine, adding while hot the butter and other ingredients. Beat all well together; form into croquettes, roll in beaten egg and bread crumbs, and fry in boiling lard.

MUFFIN PUDDING.—Take four fresh muffins, split and spread with apricot jam; close and cut them in quarters; lay them in a dish and soak them with a cold custard of four eggs, half a pint milk, half pint cream, and flavor with a glass of brandy and one of maraschino; sweeten to taste; fill up the mould with the pieces and the remainder of the custard; steam and serve with vanilla sauce.

DOUGHNUTS.—Six cups of flour, one and a half cups of sugar, three teaspoonfuls of Horsford's baking powder, one teaspoonful of salt, butter the size of half an egg. Mix thoroughly; then add four eggs well beaten and moisten with sweet milk until a soft dough; flavor to taste. Cook in boiling lard.

ORANGE JAM.—Weigh the oranges before peeling and put a pound of sugar to a pound of fruit. Take the peel from half the oranges, grate it and add the sugar. Open the oranges and be very particular to get out the seeds and white strings; add to the sugar and peel, with a little water, and boil twenty minutes.

ARROWROOT PUDDING.—To a dessertspoonful of dry arrowroot use a half a pint of milk or water and a teaspoonful of sugar. Mix the arrowroot and sugar, and smooth with a little milk or water. When the half pint of milk has just come to a boil, pour it over the sugar and root and stir well. To thicken nicely the arrowroot must be kept in a dry place. If it does not thicken when the milk is poured over, place the whole upon the fire and stir until it does. This is very nutritious and strengthening for invalids and is pleasant to children.

THREAD SPOOLS.

WHERE AND HOW THEY ARE MADE AND POLISHED.

Among the peculiar industries which flourish in western Maine is the making of thread spools. They are cut from smooth, white birch timber—a wood which works easily—by various kinds of improved machines. There are numerous mills throughout the lumbering region, where the birch is sawed into strips about four feet long and from one to two inches in width and thickness. These strips then go to the spool factories, to be converted into spools. The processes they are put through are numerous, and one of them, the method of polishing them, is quite interesting. A barrel is filled nearly full of them and then revolved by means of machinery and belting until the spools are worn smooth by rubbing one against another. Spool manufacturing is the most important industry in several of the villages of Oxford County, and will doubtless continue so until the supply of white birch timber is exhausted. The manufacture of shoe pegs is another peculiar Maine industry, though shared in to some extent by other New England States. These are cut from maple and white birch by machinery, and are worth at the factory from thirty-five to ninety-five cents a bushel. The compressing of sawdust is also a flourishing business in Bangor in that State. There is a firm there styling itself a "compress company," who convert sawdust and shavings into solid bales by compression, which finds ready sale in the large Eastern cities.

SPIRITUALISTIC HUMBUGS.

PROFESSOR HUXLEY RELATES HIS EXPERIENCE WITH
MEDIUMS.

The oldest in date of my spiritualistic experiences goes back about five-and-thirty years. It took place at the house of a relative of mine, and the "medium" was a pleasant, intelligent and well-mannered woman, a native of the United States, whom I will call Mrs. X. The chief performance was the usual pencil and alphabet business, and operations began with me as scientific witness and doubter general. The ease and rapidity with which that quiet transatlantic lady fooled me was, as she herself might have said, a caution. The name of the dead friend of whom I was thinking was spelled out in no time, and I was left morally agape, while Mrs. X. followed up her victory, and made one after another of the company a still easier prey. However, as soon as I could pull myself together, I watched the proceedings somewhat narrowly. I noted that the medium's success was by no means uniform; and in the case of one of my friends, who enjoyed a well-deserved reputation for outward impassibility, she failed altogether. So when Mrs. X. had made the round of the table I asked for another trial, and this time the failure was total and complete. The only difference in the conditions, however, was that on the second occasion I had my nerves and muscles under strict control, and took care that my pencil should pass along the letters of the alphabet as impartially as the hand of a watch over the figures on the dial. I have no doubt that on the first trial I had, quite unwittingly, rested longer on the letters which interested me, from part of the name which I had in my mind. Whatever the nature of the distinction, and however slight it may have been, it was quite enough for the keen eyes of Mrs. X., sharpened as they were by incessant training. But the interpretation of the signs unconsciously given by the investigator is only one-half of the medium's work. The other is to notify that interpretation by the "raps." Mrs. X.'s "spirits" did their work admirably. The raps were loud and abundant, and the company declared that they came from all parts of the room; indeed, there were some who maintained their persistence in the house for days afterward. At any rate, the sug-

gestion that the particularly quiet woman who sat easily talking at the head of the table could be all the while making these wonderful noises seemed at first sight outrageous. Drive it away as I would, however, the suspicion, the offspring, no doubt, of a basely materialistic philosophy, kept coming back—took shape as a theory, and finally, by dint of patience and perseverance, embodied itself into practice. From that time forth I became the master of two spirits quite as efficient as those of Mrs. X., and, I verily believe, of the same nature. My "delicate Ariels" reside in the second toe of each foot. The method of evocation is simplicity itself. I have merely to bend the toe and then suddenly straighten it; the result is a sharp rap on the sole of my shoe, which by practice may be repeated very rapidly, and rendered forte or piano at pleasure. To produce the best effect it is advisable to have thin socks and a roomy, hard-soled boot; moreover, it is well to pick out a thin place in the carpet, so as to profit by the resonance of the floor. The upper leather of the boot should be kid, rather than patent, as a bright surface may betray a slight movement. By skillful modification of the force of the blows and conversational misdirection of people's attention (by the methods familiar to conjurors and ventriloquists), the ordinary intelligent and well-educated member of society—who is about as competent to deal with these matters as a London street boy with a dairy farm—may be made to believe anything as to the direction of the sounds. So long as no one is allowed to touch the foot of the operator, detection is impossible. When I was in good practice I could stand talking on a well-lighted floor, while the bystanders, who knew that I caused the raps, could not divine how they were produced. And, at one time, I got so much in the habit of rapping that I used to catch myself doing it involuntarily, as a man in a brown study may rap with his fingers. I learned something else which interested me that evening. One of the guests confided to me that, some time before, he had met Mrs. X. at a country house. In the course of a seance, my informant was told that the spirit of his deceased sister Mary desired to communicate with him, and, with gravity befitting the circumstances, he took his share in the interesting, and indeed touching, conversation which followed. At the end of the seance the company broke up into groups. Mrs. X. and my friend happened to stroll away from the rest toward a bay window, whereupon this brief but pregnant dialogue took place: She—Did you ever have a sister Mary? He—No. She—I thought not. Any one could discern, on very short acquaintance, that my friend was a kind-hearted, chivalrous gentleman; but it is not everybody who would have perceived so shrewdly that Irish wit had, for once, been too much for Yankee cuteness, and that the only chance for the culprit was to throw herself on the mercy of the court. Fraud is often genius out of place, and I confess that I have never been able to get over a certain speaking admiration for Mrs. X. But as to the other two media whom I have tried and found wanting, they were merely male and female specimens of the Sludge family—wholly contemptible, clumsy creatures, with no faculty save boundless impudence. * * * When I am told that certain of my contemporaries, justly esteemed in science or in literature, believe in spiritualism, I can but reflect that certain other persons of that day, most unquestionably not in any respect less worthy of consideration, believed in witchcraft and demoniacal possession. Kepler had faith in astrology; Descartes made a pilgrim to Loretto; all the learning and acuteness of Henry More did not prevent him from enthusiastically backing another very acute and accomplished person, Glanvil, in his battle for the truth of the silly story about the "Daemon of Tedworth"—as silly a story as any to be found in the records of "spiritualism." If I decline not only to believe in astrology on the authority of Kepler; in the genuineness of the Palestinian house which flew to Loretto on that of Descartes; in the Daemon of Tedworth on that of Glanvil and More; but even to allow that the favorable opinion of these emi-

ment men makes out a *prima facie* case for these beliefs—it does not seem to me that I am wanting in due respect to Messrs. A, B and C, who are surely not the superiors of Kepler, Descartes and More, if, for the same reasons, I attach no greater weight on their authority, in pari materia. No one deserves much blame for being deceived in these matters. We are all intellectually handicapped in youth by the incessant repetition of the stories about possession and witchcraft in both the Old and the New Testaments. The majority of us are taught nothing which will help us to observe accurately and to interpret observations with due caution. Very few of us have the least conception how much more difficult it is to make such observations and interpretations in a room full of people, stirred by the expectation of the marvelous, than in the calm seclusion of a laboratory or the solitude of a tropical forest. And one who has not tried it cannot imagine the strain of the mind involved in sitting for an hour or two in a dark room, on the watch for the dodges of a wary "medium." A man may be an excellent naturalist or chemist, and yet make a very poor detective. But, in these investigations, those who know are aware that the qualities of the detective are far more useful than those of the philosopher. I had no intention when I sat down to write so long a letter. But I have for many years watched, not without anxiety, the recrudescence in our times, and under respectable sanction, of that belief in man's power of evoking spirits from which the basest and crudest superstitions of bygone ages logically enough took their origin; and perhaps the expression of my views may be of use, at least to those who have not yet toppled over the edge of common sense into the spiritualistic puddle. Those who have seem to be past praying for.

FAT POULTRY.

A CHICKEN FEEDING APPARATUS FOR EPICUREAN GRATIFICATION.

William O. Williams, a newspaper man, formerly of the press of this city, and later of Paris, has introduced into this country a somewhat novel epicurean scheme. He proposes to prepare poultry for table use after the most approved French plan, where the fowls are bred and fattened exclusively for eating. The chickens, of approved breed, are taken young, confined in well ventilated boxes in a darkened apartment, fed three times daily by artificial means with prepared food, composed of cream and ground cereals, are allowed no exercise, and have no business in life but to acquire tenderness, fatness and juiciness. Their flesh is then in a condition to tempt the duller appetite. The boxes are arranged in tiers, one above the other, in a cylindrical frame, each bird being fastened in its box with its head to the front. The feeder is supplied with a box of the prepared food and a force pump. Each chicken is taken in turn, its mouth opened and a tube inserted, through which its quota of food is forced into its crop. For broiling purposes, chickens are taken when from three to four months old and kept under treatment three weeks. For roasting, those from five to eight months old are selected, and they are fed a month. The treatment in that time adds about 60 per cent. to their weight.

BUSINESS NOTES.

MELLIN'S FOOD.

Mellin's Food is a soluble preparation, containing proper proportions of those nitrogenous and phosphatic matters which are essential for the healthy growth of a child, but are not easily obtained in prepared foods as usually sold. It is not only readily digestible itself, but it actually assists to digest milk or other foods with which it is mixed. I have made a careful experiment on its actual feeding qualities, and am thoroughly satisfied with the results.

G. W. WIGNER, F.L.C., F.C.S.,
President of the Soc. of Public Analysts, London, Eng.

BINDERS FOR THE AMERICAN ANALYST.

We have selected the "Handy Binder" for binding the ANALYST, because of the following advantages: It is elegant in appearance, strong, durable and this new method of binding allows the opening of the pages perfectly flat, owing to the fact that none of the side of the

paper is used. This method also permits the taking out and replacing of one or more papers from any part of the file without disturbing the other parts. After the file is completed it ceases to be a temporary binder, and with its contents becomes a perfectly and strongly bound book. Owing to the unusual size and strength of the linen binding cord in combination with two metallic binding strips (loops) the strength and durability of the binding is wholly unequaled by any method yet introduced. Price, sent post-paid, 75 cents. To any subscriber renewing his subscription at \$1 sent directly to this office, we will send one for 25 cents, and we will give one free as a premium for every new subscription sent to us with \$1.

ANOTHER VICTORY FOR THE IDEAL.

The American Institute of New York has just awarded the medal of excellence to the Ideal Felt Tooth Polisher, manufactured by the well-known Horsey Manufacturing Company of Utica, the judges of award being Drs. Davenport, Woodward and Miller, three of the most prominent dentists in New York city. The growing reputation of this article in the hygiene of the teeth is now reflecting great credit upon the manufacturers, not only throughout our own country, but in many foreign lands, where its successful introduction has been effected, and from which the most favorable professional comment is received.

NOVEL ENTERPRISE.

Entering a large grocer's store the other evening, we inquired for some of James Keiller & Son's Dundee Jams; the grocer informed us that he had sold all he had, and could not obtain any more this season, as the supply in the United States was unusually short this year. He offered us another make of imported jam, which he told us depended almost entirely for its sale upon being imported, and the well-known inability to fill orders of Keiller & Sons, all of whose customers were regularly drummed for this jam after Keiller's stock was exhausted. Surely it is an ill wind that blows no one any good.

BETTER DO IT.

Shall I keep a diary? If you decide in the affirmative be sure to use an Esterbrook Pen. All stationers have them.

HORSFORD'S ACID PHOSPHATE.

For indigestion, Dr. Geo. W. Hall, St. Louis, says: "I took it for indigestion and found it of decided advantage."

THE DETROIT FREE PRESS SAYS:

In going to New York to stay a day, a week, or month, you want moderate prices and central location. The Sturtevant House, Broadway, cor. 29th Street is all that can be desired, and nearly 2,000 cars pass its doors daily.

We Scrub Only with

Because we have found nothing which is harmless, that will make things perfectly clean with so little labor in so short a time; besides, it is economical and makes the work easy.

Do you suppose—that anything could attain such popularity as PEARLINE enjoys, and hold it, without wonderful merit—that people would use it year after year were it harmful to fabric or hands—that the hundreds of imitations are attracted by anything but its wonderful success?

You'll do well to use Pearline—see that your servants use it, and insist that they do not use the imitations which they are often induced to try because of the worthless prize accompanying it, or by the glib and false argument of some peddler.

Remember, PEARLINE is never peddled.

DEAN'S PATENT ARDENTER MUSTARD.

BEST IN THE WORLD.

Ardenter Mustard Pellets

— FOR —

Dyspepsia and Indigestion.

UNIVERSALLY recommended and prescribed by physicians. The medicinal property are English mustard seed coated with pepsin and sugar. You will find it will relieve you after using two or three doses. It is very beneficial for Heartburn, Sour Stomach and Headache. They are a beautiful confection for children. Each bottle contains full directions.

W. G. DEAN & SON,

361 and 363 Washington Street, 84, 86 and 88
North Moore Street, New York.

MALTINE

MALTINE is far superior in nutritive and diastatic value to any Malt Extract manufactured in the World. There is no reconstructive that excels Maltine in Phthisis and many wasting Diseases.

MALTINE in its different forms is the only malt preparation we now employ, being so palatable, digestible, and easily assimilated. Of its efficiency in appropriate cases there is no more doubt in our minds than there is of the curative power of Quinine, Cod Liver Oil, the Bromides, and the Iodides. It deserves to stand in the front rank of constructives, and the constructives by their preventive, corrective, and curative power are probably the most widely useful therapeutical agents that we possess. PROF. L. P. YANDELL.

MALTINE is a valuable food, a food of priceless value at times of emergency. In fact, in very grave gastric cases it is a food which may be often resorted to when at one's wits end what to do. J. MILNER FOTHERGILL.

Out of 14 trade samples of Malt Extract examined by Messrs. Dunstan & Dimmock, ONLY THREE possessed the power of acting on starch. These brands were MALTINE, Corbyn, Stacey & Co.'s Extract, and Keppeler's Malt Extract. WILLIAM ROBERTS, M.D., F.R.S.

I have subjected "Maltine" and all other leading "Extracts of Malt" to an exact quantitative comparison of their diastatic activity. The results demonstrate conclusively the far greater diastatic value of Maltine and enable me to state, without any qualification whatever, that it far exceeds in diastatic power any of the six preparations of Malt which I have examined. E. H. CRITTENDEN, Professor of Physiological Chemistry in Yale College.

At the International Health Exhibition held in London, England, the only gold medal and the highest award of merit were given to Maltine by a Jury composed of the best chemists in Europe, and recent analyses made by the most reliable authorities in Europe and America prove conclusively that Maltine—in nutritive and diastatic value—is superior to all other malt preparations now in the market.

NOTE.—Physicians will observe that Maltine, as now prepared, is not so viscid as formerly made, being of a more fluid consistency; and, while retaining the nutritive and diastatic value which has given it precedence over all other Extracts of Malt, it is rendered entirely agreeable to the taste of the most fastidious, and is more easily administered. As now prepared, we positively guarantee that Maltine will not ferment or congeal in any climate or at any season of the year.

COMPLETE LIST OF MALTINE PREPARATIONS.

MALTINE (Plain). MALTINE with Phosphates, Iron Quinine, and Strichia.
MALTINE with Alteratives. MALTINE with Cod Liver Oil.
MALTINE with Hypophosphites. MALTINE with Peptones.
MALTINE with Peptones. MALTINE with Cascara-Sagrada.

Physicians may obtain Maltine from all druggists in every part of the world. In cases where the physician intends to prescribe Maltine, the word "Maltine" should be written, and not simply the words "Malt Extract," or "Extract of Malt." Send for Pamphlet giving comparative analyses by 100 of the best Analytical Chemists in this country and Europe.

We will be happy to supply any regular practitioner with eight ounces each of any three Maltine compounds that may be selected from our list, providing he will agree to pay express charges on same.

OUR SHOPPING BAZAARS.

There has been a tendency in our large cities, of recent years, to the establishment of large retail stores in which various branches of retail trade heretofore confined to separate stores have been united under one roof and management, though, perhaps, divided up into departments. There can be no doubt of the convenience of such an establishment, so far as it obviates the necessity of visiting many stores in search of a list of articles one wishes to purchase, but it does not really save time, because each purchase in such a store occupies fully as much time as it would in several stores. The only question we propose to consider, however, is that two-fold one in which the consumer is interested, quality and price. Both of these points open a wide field for consideration and lead on to other connected, though at first sight, apparently irrelevant subjects. As to quality much depends upon the knowledge and experience of the buyer for each particular department

and upon the consideration given to maintaining the reputation of the house for keeping the best goods. Unfortunately the public has been taught to look upon these bazaars as places where everything can be bought very cheap; and as some goods that are really of superior quality, cannot be bought at less than regular prices, this public expectation compels the proprietor of the bazaar to lower the quality of his goods. As the price at which they are sold is so closely connected with the question of quality and purity, we must stop for a moment to look into some of the methods of these stores, and their effect upon the methods of other establishments in similar businesses. It will be seen at once that the most powerful lever of trade, competition, largely influences here, not only in the business of other bazaars, but also in all stores selling any goods dealt in by the bazaars. The general idea held out to the public is that as the bazaars are large buyers and make rapid sales they can manage to pay their enormous expenses by the large aggregate of small profits. This, however, is only true to a limited extent. There are many staple goods on which the profit, even to the heaviest purchasers, is very small, and as no one can afford to retail goods without profit it goes without saying that there must be some way out of such a dilemma. This is accomplished by an ingenious system of making a paying advertisement out of what otherwise would be a heavy loss. Goods, with the prices of which the public generally is perfectly familiar, are sold at a loss, but this loss is carefully limited. For instance, a certain magazine can be bought in one of these bazaars at three cents less per copy than its cost at the best trade discount. Here the loss is limited by the firm selling only five hundred copies, and thus losing only fifteen dollars. After these five hundred copies are sold, though thousands more might be disposed of, no more are offered, but the reason for this, though obvious, is not explained to the customer. In this way the firm at the trifling cost of fifteen dollars has impressed the public with the idea that owing to the magnitude of the business done they can undersell every other store by ten per cent. As this does not pay when done very often, and as the lesson to be effective has to be repeated daily, other means must be resorted to, and here is precisely where the consumer is innocently helping to injure himself. Job lots and auction goods aid to a limited extent to fill the gap, but where this cannot be done resort must be had to inferior goods, which frequently look just as well, if not better than the superior goods. On such goods as these the bazaar makes enormous profits and the consumer meets with a corresponding loss. Again, while the innocent purchasers have been taught that these bazaars sell goods cheap, they will sooner or later learn that on goods, the prices of which are not so generally known, or where the value is concealed or depends upon the reliability and honesty of the house selling them, this apparent cheapness is a myth and the goods sold are really very dear. There is also a further evil consequent upon this system, the effect on other dealers in the same line, who, in order to hold their customers, have to cheapen their goods, which, as the manufacturer

will not permit himself to be a loser, invariably reacts on the consumer. A good example of this injurious result may be seen in the brush business. Only a short time ago the brushes sold in house-furnishing stores and bazaars were well made by well paid free labor, now, it is impossible for a manufacturer employing free labor to sell to these retailers. Only prison-made brushes can compete for this custom. Thus a large number of honest working people are seriously injured. Another evil effect of the bazaars that may be referred to here has shown itself in the collar business. Sharp competition had so depressed this industry that those firms who dealt in imported collars were compelled to withdraw, and only domestic manufacturers who dealt in inferior goods, collars made with linen outside, filled with muslin, could maintain themselves. As soon as they had ridden themselves of the competition, they immediately resorted to a combination of the few manufacturers left and put up prices, secure in refusing to sell goods to any retailer who would not sign an iniquitous agreement to sell these cheapened goods at the highest prices. Of course this will last only until a better grade of collar can be imported again, but until then the consumer is made to suffer. No doubt this trouble extends to many other branches of trade. What is the best remedy? Is centralization alone to blame? How much blame rests on the consumer?

ELECTRICITY IN COLLEGE.

A marked indication of the current of the period, and a valuable step in the right direction, is seen in the recent decision of Columbia College to add a special course of education in electrical science to the curriculum of that venerable institution. The new branch will be an appendage to the School of Mines, as a post graduate course to extend over from one to three years, the shorter period sufficing probably for such students of natural philosophy as do not contemplate giving exclusive professional devotion to electrical science. The proposed course, it is announced, will consist in practical work, construction of lamps, dynamos, primary and secondary batteries, insulation and installation of the plant, and investigation of the phenomena of electricity. The advantage of thus combining theoretical and practical knowledge cannot be over-estimated. The mere book student of any science, however profoundly versed in its general principles, must always stand at a disadvantage alongside the practical man who has been trained to a mastery of its mechanical manipulation; while the latter, in his turn, is often seriously handicapped by his deficiency in theoretical knowledge. The really scientific man, to be successful for himself and for others, should combine both these requirements, and be competent to conduct his own observations, make his own calculations, draw his own designs, and work from his own drawings. With the facilities at the command of Columbia College, we shall expect to see a new impetus imparted to electrical investigation and application. With all its wonderful achievements, the science is still

in its merest infancy, and the possibilities it holds out, vague as they are, and wrapped in mystery, are so immeasurable in their scope and so manifold in their manifestations as to render its study one of the most attractive pursuits to which human intelligence can be devoted. Nor is the prospect less inviting when viewed from a more material standpoint, for the rewards open to the successful electrician are as brilliant as the flashes of the mysterious element out of whose responsive activities they are evoked.

LAND AND TAXES.

That earnest agitator, Henry George, is steadily laboring to make converts to his "single tax" doctrines; but we fancy he has not secured many landed proprietors or real estate owners among his disciples. As there is a widespread misconception regarding the real purpose of this "single tax" theory, we will state in brief explanation of it that it contemplates the substitution, in the place of all the taxes now levied for revenue, of one tax only, which is to be assessed upon the value of land—not, as popularly imagined, upon the land itself. The distinction will be seen in the definition of his theory, given by Mr. George himself at a meeting reported recently in the daily papers. "Some of our opponents," he said, "are talking of us as people who wish to put all taxes on land. We don't propose to tax land. We propose—and that is a very different thing—to tax land values. Taxing land means taxing all land; but a tax on land values does not mean the taxing of all land, but only the taxing of valuable land, and that in proportion to its value. A tax upon land would tax all land, would resolve itself plainly into a tax that must be paid before the land could be used, and therefore into a tax upon labor; but a tax upon land values, only falling upon valuable land, would not affect all land, nor even all land in use, for the poorest qualities of land in use have no real value. If at any time they have a selling value, it is merely a speculative value; and therefore a tax on land values would always leave a margin of land on which no tax fell at all. It would not be a tax upon labor, nor a tax upon the production of wealth. It would be simply a tax upon a special privilege." The idea is plausible, and, as we said above, it is gaining the acquiescence of many not directly affected by its limitations. Those who have adopted it seem, however, to imagine that they have discovered in it a cure for all existing social discords. They would have all government expenses borne by "social" and not by individual wealth. They propose that the land, which gives labor and capital the opportunity to realize the largest return for their outlay, shall pay the largest proportion of society's expenses—the less valuable land to pay only its proportionate share. They anticipate as the direct result that wealth will become more evenly distributed, obstructions to its production will be removed, prosperity will be universally extended, and mankind will be raised to higher grades, with fewer intervening caste distinctions. This is all very charming as theory; but it is questionable whether the practical application of the "single tax" theory would effect any such millennial results. More probably the land in cities, whose improvements and eligibility of location should impose upon it the greater share of the tax burden, would become too expensive for ordinary business purposes, and would ultimately and in regular course pass into the possession of the city as a forfeit for unpaid taxes. Forfeited lands of that kind are notoriously unremunerative, and the deficit thus created would have to be made up by increasing the taxes of the holders of the remaining occupied land, with results that can be readily conjectured. This is a rough analysis of the probable practical working of the "single tax" system, but in a general way it is a reasonable forecast of the logical outcome of the theory. The reasoning of course extends from the city to the State. Large cities would cease to develop, commercial and business enterprise

of every kind would be paralyzed, and society would lapse into that dead-alive condition typified by Mandeville in his "Fable of the Bees," the difference being that in the one instance it would be government burdens, as in the other it was dead equality of individual virtue that throttled and extinguished the vital energies of the community. There is good ground for the belief that our surmise as to the ultimate results of the system are also entertained by Mr. George, as the underlying condition of his land tax theories is avowedly the compulsory sequestration by the State of all personal titles to real estate. In his pessimistic paradox, "Progress and Poverty," that ingenious speculator, after summing up the increase of burdens and disabilities which, by his reasoning, attend the laboring man with every step of social advancement, he declares, "We should satisfy the law of justice, we should meet all economic requirements, by at one stroke abolishing all private titles, declaring all land public property, and letting it out to the highest bidders." The effect of the "single tax" would be, as we have shown, the gradual extinguishment of private land titles, instead of the more robust proposition just quoted, to abolish them at a single stroke. The result would be equally suicidal in both instances. There is a manifest absurdity in the sober promulgation of such doctrines at this period, when the masses, especially in the United States, are in a far more independent and comfortable condition than they ever were before, when the condition of workmen is steadily advancing, and when wages are constantly growing greater, while the cost of living is not proportionately increasing. The nationalization of land does not seem to be imperatively demanded for the protection of this generation.

A VOICE FROM THE INTERIOR.

The *Butchers' Record*, an unfathered and, to judge by its own complaints, an unappreciated weekly, hailing from Alleghany, in the State of Pennsylvania, is evidently famishing for recognition. To attain this, it takes pains to misquote the AMERICAN ANALYST, calling us all kinds of hard names and claiming that we made figures contradict the truth in our publication of the retail prices of beef. Bare assertions, unsupported by argument or proofs, do not amount to anything. If the *Record* is really the organ of the butchers, as it claims to be, it would have been an easy thing to obtain the assistance of some of its constituents to prove wherein our figures were false. But the figures told the exact truth and all of the genuine butchers who are too intelligent to be befogged by this amateur "organ," know it, hence the *Record* does not and cannot show where our errors exist. There is often considerable amusement to be gotten out of the columns of these would be organs. Not knowing exactly what they ought to say to please the agitators whose schemes they would serve, and afraid to offend the butchers whose money they want to get, they are led into all kinds of blunders. In the latest fulminate is the funny suggestion that the Pittsburgh butchers do not want to interfere with the business of the Chicago dressers—they only want the latter to establish slaughter-houses in Pittsburgh. To believe the *Record* the butchers are actually aching to have Mr. Armour open an abattoir in Pittsburgh. The *Record* evidently forgets that Col. Slaughter has told the butchers that their only salvation from becoming Armour's meat-cutters is to subscribe five dollars a piece and kill off the Chicago beef-dressers. It is pitiful to perceive that the butchers do not seem to appreciate their self-styled organ. They don't support it, so the *Record* says, and it ought to know. It is evident that the lot of a would-be butchers' organ is a hard one. The members of that craft are not ignoramuses to be led by the nose. They are doing well as it is and are perfectly satisfied to leave well enough alone. If we were at all interested in the matter we should recommend the *Record* to brace up a little, and convert itself

into the "organ" of some less intelligent branch of trade by which it would be more satisfactorily appreciated.

THE PURE FOOD FIZZLE.

The astounding information is vouchsafed us, on the authority of the N. Y. *Press* Washington correspondent, who has been looking up the prospects of "pure food" legislation at the National Capitol this session, that he "finds that the interest in the passage of a bill to prevent the adulteration of food has almost entirely disappeared from Congress." The fact is, the flimsy devices of the retail grocers who have hitherto kept the "pure food" agitation inflated have been so thoroughly exposed, that they find it prudent to let the subject pass "innocuous desuetude." What will the next scheme be?

LARD AND LEVITICUS.

THE HEBREW HOUSEWIFE EXULTING IN A COTTON SEED PRODUCT.

In a recent issue the editor of the *Hebrew Journal* made this statement:

The other day I received a circular extolling the merits of kosher lard—that is, lard made from cotton-oil. And now the only thing left for the ingenuity of the American inventor is to discover some process by which bacon and ham can be rendered kosher enough to meet with the approval of Rabbi Joseph himself.

To the Christian reader this probably has little significance, but it means a great deal to the Jew. For many generations the Jewish housewife has been beset with vexations and difficulties from which her Christian sister was altogether free. The Mosaic laws, with their minute regulations concerning both the preparation and serving of food, hampered her in many respects, and made for her much labor that would, without their interference, have been unnecessary. Of course, everybody knows that pork does not enter into the Jewish house, but further than that the knowledge of only the minority outside the faith extends. Chapter XI. of Leviticus contains a bewildering list of animals, fowl and fish that were declared unclean, but the restrictions that appear in the Bible were of little moment compared with the many that were added afterward by the rabbis or wise men, so that now the orthodox Jewess stands in continual fear of transgressing some of the regulations of the household, as they are laid down by Rabbi Joseph and his kind. The ban against the hog was pronounced in the sentence that forbade the eating of any animal that did not divide its hoof and also chew its cud. This, of course, ruled against the fat of the hog also, and never has lard been used by any Jew who at all respected the tenets of his faith. In fact, many Jews who have departed from the ways of their fathers, and who have thrown aside the traditions of their religion, would not use lard under any circumstances; and it is undoubtedly true that, while originally the flesh and fat of the hog were considered no worse than those of any other of the forbidden animals, they became many centuries ago the most sinful of all in the eyes of Israelites, and no more severe persecution was ever attempted by their enemies than when they forced the obnoxious food down their abhorrent throats. The New England wife who has made her toothsome doughnuts and flaky pie crust with the aid of lard will, no doubt, wonder how any cook could ever get along without it; but the Jewish cook had to stand even greater deprivations. In making doughnuts and pie crust, she could use butter, provided, however, that these dainties were not eaten with any other dishes that contained meat or its products. The rabbis have interpreted the Mosaic laws to mean that flesh and milk must not be eaten at the same time, and the orthodox Jew will not eat them within an hour of each other. As butter is the product of milk, pie crust containing butter could not, of course, be

served at any meal in which meat was also a part. In frying meats their regulation prevented the cook from using butter or lard, and left her the choice between vegetable oils and beef fat. Even in regard to these there were some restrictions. All beef fat is not kosher or clean. All cholef—that is, tallow—is not kosher. Cholef includes the fat around the intestines and kidneys. Miker, the fat between the intestines, is kosher, and this is what the strict Jewish cook has used mainly as long as there is any record. In European countries, where the Jews still live together for the most part in certain quarters of the cities, towns and villages, no other grease is used than the beef fat and goose grease. Polish Jews are especially addicted to the use of the goose grease, which is very fine and much more expensive than lard. German Jews use beef fat more. In either case the cook tries out all the fat she uses herself, and is thus doubly sure that it is kosher. In fact, unless the assurance can be given that it has been tried out in kosher vessels, and that it has not come in contact with foreign substances, it would be just as unclean as the hog lard itself. Of course, the trying out of the fat meant a great deal of extra labor, and, what with keeping two sets of dishes, one for milk foods and one for meats, which were never allowed to touch each other, and observing all the other regulations, the Jewish housewife had nearly twice as much work as any other. In this country and some of the southern countries of Europe olive oil was used instead of fat, but not everybody cares to have meals prepared in oil, and the use of it was confined within narrow limits. The words of the editor of the *Jewish Journal* will bring joy to the hearts of all Jewish cooks. They mean that one of their most vexatious trials in the past can now be obviated. The reporter who inspected this new "lard" found it very appetizing in appearance. It resembles ordinary lard. It has a slight odor of the oil, but it is not at all objectionable. It is said to be made of cotton seed oil and pure beef fat. It sells at the same price as the best lard, but the manufacturers claim that it is cheaper, inasmuch as it requires a lesser quantity to accomplish the same purpose. It is necessary, in using it, to put it in a cold pan with the meat or other food, and let them get hot together. If it were put in a hot pan, the oil and fat in the lard would separate. Although this lard is made for the use of the community at large, and is not controlled by Hebrews, the manufacturers have taken especial pains to disseminate their literature on the subject among the Jews of the country. Their pamphlets are all headed with the word "Kosher" in Hebrew characters. Editor Davis, of the *Hebrew Journal*, said to the reporter that the new lard was being extensively used by the Jews in this city, and that it was saving labor for a great many Jewish cooks. Within the past five or ten years there have been great changes in the habits of the American Jews. It may be safely said that outside of the strictly orthodox Jews, who are mostly followers of Chief Rabbi Joseph, there are comparatively few Jews who pretend to obey the Mosaic laws strictly, and a very large number who pay no attention to them at all. There are many Jews who will not use lard or pork at home, and who make a show of regarding the Mosaic laws under their own roofs, who show an utter disregard of them when they eat elsewhere. This is true even of many of the seeming orthodox Jews of the east side. Anybody who has seen them at the hotel tables in the Catskills or at the sea-side resorts knows that they have eaten milk and meat together—a sin sufficient to brand them as the rankest heretics in the Jewish communities of Europe. The younger generations of Jews not only disregard these laws, as a rule, but not infrequently scoff at them, and it may be safely said that if the existence of the Mosaic laws depended upon their observance in the New World their extinction could be easily predicted. All the rabbis in the world could not check the progress of this sort of heresy where it is established in such formidable proportions. The strict Jews allege that the Mosaic laws are health regulations,

and that their general observance would do away with a great deal of the dyspepsia now existing. Among them and among their co-religionists in other countries the new discovery will prove a boon. Among the others it will be used, if at all, only because it can be demonstrated to have advantages over the product of the hog.

KNOB CELERY.

AN AGREEABLE AND WHOLESOME ARTICLE OF DIET.

Every one knows table celery, but only a few are acquainted with "celeriac," known as knob-celery, or, as it really should be spelled, *Knopfcellerie*, the German name of the same plant which has been cultivated to develop the root instead of the stalk. Celery, *Apium graveolens*, is a biennial plant belonging to the order *Umbellifera*, which in its native condition is known as smallage. In its wild state it is common in marshy places, especially near the sea, producing a furrowed stalk and wedge-shaped leaves, the whole plant having a coarse, rank taste, and a peculiar smell. By cultivation of the plants, raised from the seed, they can be developed by blanching the stalk into our ordinary table celery or by retarding the stalk and stimulating the growth of the root into celeriac or knob celery. In the latter form it may be purchased at nearly all grocers, especially in German neighborhoods. It is generally exposed for sale in bunches of three or four roots which look somewhat like beets or black radishes. The tops make good soupgreens. The roots are washed and boiled like potatoes until tender and then while still hot are carefully peeled, scraped and all pithy parts cut out. If they are to be used as a vegetable they are sliced, buttered and served. They require considerable salting. If, however, they are to be made into what the Germans call celery-salad, some fine olive oil, such as Gourmet, in the proportion of a gill to the quart of hot sliced roots is poured over them, also a gill of heated vinegar, pepper and salt to taste, and the whole mass well shaken in the bowl and allowed to cool rapidly. It should be served cold. In either way it is delicious having the full flavor of celery and the mealy taste of the potato. As celery is a good diuretic it is a very wholesome dish. It may not be generally known that celery salt is made by adding powdered celery-seeds to salt.

HEAT AND HEADS.

DOES EXPOSURE TO THE SUN CAUSE THE HUMAN SKULL TO BE HARDER AND THICKER.

One of the most interesting things mentioned by Professor Virchow in his little book just published, entitled "Medical Remembrances of an Egyptian Journey," in which he describes an excursion up the Nile as far as the first cataract, is that the broken skulls on the first great sepulchral fields, dating from Roman times, are as thick and hard as Herodotus says those of the slain Egyptians were in comparison with the brittle ones of the Persians. The Greek historian explains this by attributing it to the early exposure of children to the heat of the sun; and in many parts of upper Egypt the German travelers actually found young children thus exposed during their parents' absence in the fields, in immense clay bowls, resembling in shape a champagne glass with a stem, into which they were put without shelter. This discovery by Professor Virchow is interesting, because it at once suggests the question whether the proverbial thickness of the skull of the negro has not been caused by exposure to the sun, and whether it is a peculiarity of savages of tropical countries that their skulls are thicker and harder than those of the inhabitants of temperate and colder countries. Students of craniology have never made any investigation to ascertain whether the skulls of different races vary in degrees of hardness. It would be almost impossible to make such an inquiry. As is well-

known, the human skull increases in hardness from childhood to maturity and age. A miscellaneous collection of skulls of any given people would therefore be of no value in such an investigation. To obtain a collection of skulls of a number of nationalities, that should be taken from subjects all of the same age, to have them all similarly prepared and in sufficient numbers to make it possible to draw any general conclusions from their comparison with each other, would be manifestly impossible. More attention has been given to the relative thickness of different skulls, or rather to their weight, from which their thickness may be inferred. Of the large collection of crania in the Army Medical Museum at Washington, the thickest are those of negroes and Alaskan Indians. The skulls of other Indians, both of North and South America, in tropical or temperate climes, and of the Eskimo, do not appear to be particularly thick. Among the ancient Peruvian skulls recently received by the museum, and the ancient crania collected in Arizona last summer, there are frequent individual variations in thickness, but no tendency to unusual thickness. The conclusion from these facts is, that exposure to the sun probably does not cause thickness of the human skull. In connection with this subject, it is interesting to note, that, among the Australians the *sinus frontalis* is generally found to be solid in the males, instead of being hollow as in the skulls of other races. This bone in the male Australians generally extends straight across the head, the lower side overhanging the eyes so that they seem to look out from under it, while in the North American Indians a modification of shape deprives them of that heavy look about the forehead. The heavy *sinus frontalis* of the Australians, of course, increases the weight of the skull.

ELECTRIC STREET RAILWAYS.—In the field of electrical applications reduced to commercial use, the most striking feature of the year is to be found in electric street railway service. Not only has the business grown beyond all expectation in amount, but much improvement has been effected in its electrical and mechanical features. The establishment of an electric road is no longer looked upon as a formidable undertaking, nor is its operation regarded as a curiosity by the public. December 1, a year ago, there were twenty-one electric roads in operation in America; to-day there are fifty-two, while forty-seven are under construction or contracted for. Cheap and poor line construction and ill-adapted mechanical details, found too frequently in much of the early work on railways, are being discarded in new words and replaced in old (the old story, but promising to be less prolix in this instance than it has been in other cases). Much yet remains to be accomplished in electric traction, but the great gains of the closing year, technical and commercial, are abundantly apparent. The rate at which electric motors have been installed for stationary power is scarcely less noticeable than the development of electric traction during the year. About the first of September it was estimated that 6,000 electric motors were driving machinery in the United States. A thousand have probably been added since. It seems reasonable to estimate the number put in operation for the year at no much less than 4,000.

NAPHTHA ENGINES.—The Gas Engine and Power Company of New York has perfected an engine in which both the fuel and the power are obtained from naphtha. It has been applied to many boats of from sixteen to thirty feet in length, and works admirably. The beauty of it is that while it is cheap, clean and always ready, it can be managed by anybody. The owners of many well-known steam yachts have had naphtha launches made for them, and express the greatest satisfaction with them. The engine is started by lighting an alcohol lamp and blowing some naphtha vapor over the flame with a little hand pump. This makes a hot fire and heats the naphtha in a retort. This heated naphtha generates the gas which drives the engine. After the engine is going, which is in about two minutes, some of the gas in the retort can be used as fuel, and the alcohol lamp and pumping are no longer necessary. The engines can be instantly reversed when at the highest speed. Only 6 per cent. of the fluid in the retort is used, the remainder being returned to the tank and used over again. A two-horse power engine runs a twenty-foot launch and uses three or four quarts of naphtha an hour.

CORRESPONDENCE.

INCONSISTENCIES OF THE BUTCHERS' SO-CALLED ORGANS.

Editors Analyst.—The so-called butchers' organs are loudly crying for a State inspection law in every State to shut out Western dressed beef, but seem to have overlooked that such a law in New Jersey and Connecticut would utterly destroy one-half the wholesale and retail trade of Washington Market. They are publishing lawyers' opinions of the constitutionality of such laws and of the unconstitutionality of similar municipal laws, yet do not see that precisely for the same reasons such State laws would be unconstitutional under the United States Constitution. In another column of the same paper they gloat over the passage of such an ordinance in Denver, Colorado, which has been shown to be clearly unconstitutional. They rejoice over a law introduced in Canada to heavily tax American lard, thinking that only the hated Chicago packers make lard, and innocently overlooking the fact that some of Chicago's bitterest opponents make lard as well. In one column they pat Chris. Brokate on the back for some supposed meritorious work, while in the adjoining column they tell him that he had better stay at home in St. Louis and watch the cattle-yards there, and in the very next editorial they accuse him of using opprobrious epithets and of foolishness. They advise that the only way to get State inspection laws passed is to induce the people to demand them, and to get the people to demand them they say the people must be convinced of the necessity of such laws; but how to convince them, there is the rub. Oh consistency, thou art a jewel!

CLEAVER.

DIETARY VAGARIES.

WHAT FOODS ARE NOT ESSENTIAL TO THE PRESERVATION OF HEALTH.

There is a class of theorists in existence who claim to have scientifically demonstrated that there is absolutely nothing in the way of food, minerals, condiments or spices that is essential to health, while the utter absence of some elements of food which are considered indispensable is often conducive to health.

This theorem has been forcibly exemplified by the personal experience of well-known physicians. Dr. Garretson, of Cincinnati, is 83 years old, and it is his boast that he never in his life suffered a pain.

"How do you explain such a remarkable exemption?" he was asked.

"You would scarcely believe me were I to tell you," he replied, and an incredulous smile played about his pallid lips. "I am not as robust as some men, nor as full of life's rosy color, but my step's as light, my nerves are as true and my appetite as good as, or perhaps a trifle better than, those of men half my age, who are reputed to be models of good health. Why is it? Well, I will tell you, although you no doubt will scout the idea, as most people do. It has now been fifty-three years since I tasted meat or grease of any kind whatever, and forty-two years since I have eaten a particle of salt or seasoning of any kind in any food. Doesn't look reasonable, does it? Everybody, you know, imagines that if he were to be denied salt he would get sick and ultimately perish; but, sir, it is true—no salt in forty-two years. I have my food especially prepared at the hotel if I am away from home any length of time; if I am not, I carry enough lunch with me to last till I return. I do not eat fried food. An article fried is already condemned. Did you ever hear of anything being fried for a sick man? When the stomach begins to break down, the first thing it rejects is fried food. Next it rejects grease in any form. It's nauseous. This fat was what suggested the elimination of grease from

my food. I experimented with such marked success that my mind began to inquire further into the problem. The Indian in his native state never tasted salt, and health with him is almost a second nature. As much as I liked salt as an element to bring out the latent flavor of many articles of food, I regarded perfect health as essential to happiness and conducive to greater enjoyment of life than what little pleasure I might extract from an hour at table, and my salt went the way my meat and grease went. As when I gave up meat and grease, the denial cost me a great effort, but I came out in time master of the situation, and have not for years had any desire for any of those things. Taste is very much a thing of cultivation. The palate is capable of being adjusted to a high appreciation of almost any flavor. Why, I have seen men gag over beer and oysters and bananas and tomatoes and whatnot, when they first tasted them, but after repeated attacks became fond of any or all of them. To me, now, a seasoned article of food or grease in any form would be as unpalatable as an article which you refuse to eat unless highly seasoned would be to you were it not seasoned. I suppose you know," continued the doctor, "that Theosophists eschew all manner of meat, and some of them, I believe, include grease. It is not in keeping with their theory of life to eat anything into which animal life enters. I might say they are 'mentalists.' They hold, perhaps not without some foundation, that whatever we eat, becoming a constituent part of our parties, exercises more or less influence upon our lives, and, as the brute is a lower being than the human, to consume his flesh has a tendency to retard mental development and spiritual advancement. It has been my observation all through life that the man who consumes great quantities of meat is hoggish in his disposition and brutal in his conduct. The animal becomes a part of him. And what a marked contrast there is between him and the lady—or gentleman for that matter—who lives on delicate food. I do not know what pain is. I have no conception of it. I never had a headache, nor has an organ of my body ever been affected in any way."

Dr. Garretson's complexion might be termed a "pale white"—a sort of a spiritual hue. His eyes are bright, clear and steady in their expression, and his slender form is as erect as that of a young man.

Dr. Ephraim Cutter, of this city, is considered quite an expert on food. He read a paper on "Hygiene for Home Missionaries" before the Social Science Society in London, June 12, 1887, of such excellent merit that he was at once voted an honorary membership; besides which he is an M. D. of Harvard, an A. M. of Yale and an LL. D. of Iowa.

"What should a man eat for health?" he repeated when the reporter asked him the question. "Well, I'll tell you: In August, 1884, I was at my brother-in-law's grist-mill, and noticed the Michigan winter wheat as it came through the smut-mill, clean and fair, ready to be ground up into 'wheat meal' or flour. The idea struck me, why not use this cleaned wheat for food? It is free from dirt and contains all the form and chemical elements in proper proportions for nourishment that our Creator intended mankind should have when wheat is eaten. We do not crack or grind up other fruits, as tomatoes, bananas, potatoes, etc., a long time before they are eaten, nor do we deprive them of their natural protective garments and mechanically separate their form elements, so that one-half at least of the nutritious qualities are taken away and fed to brutes, as we do in wheat. If those products were subjected to such treatment, they would become unfit to eat. Why not, I thought, get the aroma and bouquet of the wheat in the cooking and not lose it in the milling. Acting on this impulse, I took home with me a half-bushel of the cleaned whole wheat, and put my family on it to see how long they could live on it without tiring. The experiment has been carried out up to the present time—now over four years—with no signs of tiring. My wife, who is my authority in cooking, after many trials of hers

and my own—in which I was laughed at—prepare it this way: To cook sufficient for four adults take one cupful of wheat, and washing it clean in cold water, put it in a tin pail or crockery bowl and add one-half teaspoonful of salt and three cupfuls of cold water. Then suspend the pail in a pot of cold water, set it on a heated stove and boil for ten hours. When cooked it should be soft adhesive, glutinous and easily masticated. Serve with butter or milk or cream, or eat it without, as the Asiatics eat rice, with no seasoning. If the cooking is well done there is an agreeable, nutty flavor of the wheat which corresponds to the bouquet of grapes. This flavor seems to be lost when the wheat is cracked, crushed or ground long before cooking. "Now, what is the advantage? I will tell you. This is a perfect food and gives all the body's tissues a chance to bed and nourished. It is intended that this should take the place of oatmeal, which has less gluten as compared with wheat, and is harder to digest. It is better than flour. Magendie fed dogs on flour exclusively and they died in forty days, while other dogs thrived on whole wheat. Judge Abbott, of Boston, once told me of some shipwrecked sailors, who were obliged to live on flour alone and they nearly starved. They could have lived on wheat. It is more economical also than flour. It goes further, feeds better and gives better nutritive results. Hence when money is scarce and resources have to be husbanded—or 'wifed,' it may be more truly said why not resort to this food? The objection to the tegumentary coats is not so great as some doctors might suppose. It is free from yeast and not liable to fermentation when taken into the system. Why, the old Roman soldier lived on wheat, carrying a bag of it on his marches and chewing it at will. The less sugar used the better, as all the starch of wheat has to be converted into glucose before assimilation. If people were taught to use less sugar they would know better what are the natural flavors of different foods; would like them just as well, if not better, and have much better health in the bargain."

"I must tell you an experiment my old friend, Dr. James H. Salisbury, made in Ohio," continued the doctor. "He employed six healthy men, ranging in age from 25 to 40 years, and in weights from 145 to 172 pounds. He paid them \$30 a month, fed them exclusively on baked beans and coffee, required them to take a two-mile walk morning and evening, retire at 9 p. m., and rise at 6 a. m. They were allowed all the cold water they wanted. On the third day they began to bloat badly. By the ninth day their ears were ringing, they were dizzy and their hands and feet pricked. Symptoms of progressive paralysis began to show themselves on the tenth day in all six cases, and these symptoms daily increased thereafter. On the sixteenth day the disease was so marked that not one of them could walk straight without support. All wobbled and dragged their legs, not being able to lift them from the floor. On the twentieth day he changed their diet. They had lost from eighteen to twenty-five pounds apiece. He gave them beefsteak freed from fat and white tissue and bread, and they ate ravenously and soon recovered. Dr. Salisbury next tried four stout, hearty men on oatmeal porridge, seasoned with butter, pepper and salt, and allowed them at each meal a pint of coffee, seasoned with sugar and milk. The second day they commenced to become flatulent; on the fourth day, colic pains; the seventh day the derangements were more marked; fifteenth day, nightmare and bad dreams; very dull, mixed and stupid; stomach distended with gas, ringing ears, heart irregular, feet and hands numb, and mouth and throat covered with sticky mucus. Their symptoms grew more alarming until the thirtieth day, when he did not deem it prudent to continue the experiment, and the moment he resorted to other foods they began to recover. So that is sufficient evidence that neither baked beans nor oatmeal possesses the life energy which people imagine they do."

Dr. Cutter says that bread, rice, wheaten grits, hominy, sago, tapioca and potatoes have each been fed upon

continuously for from forty to forty-five days before serious diseases and symptoms were produced. These foods are very similar in their action upon the human body, and cause like derangements and pathological states. They sustain the organism far better and can be borne longer than any other vegetable aliment before grave disturbances arise from their exclusive use. Were the exclusive feeding kept up too long, either consumption of the bowels or lungs or both may result, or Bright's disease, diabetes, paresis, fatty diseases of the liver, spleen or heart or fibrous consumption may be the outcome. Green peas and string beans rank in point of alimentary qualities. Green corn, turnips, beets and squash cannot be subsisted upon exclusively for more than a very short period before grave derangements will ensue. Asparagus is the most injurious of all vegetables when lived on alone. They attack the kidneys. Meats can be subsisted upon longer than any other food, and the reason is this, that the first organ of the digestive apparatus—the stomach—is a meat-digesting organ. But this refers particularly to beefsteak. Eggs, fish, pork, veal, chicken, turkeys and game, if eaten in undue proportions, will result in meat dyspepsia, producing great distress and oppression, the gulping of wind that tastes like rotten eggs (sulphuretted hydrogen), and then sickness, weakness and loss of appetite.

Both the gentlemen quoted, and the third whose experimental tests are related, do not so materially disagree. Dr. Salisbury says, and Dr. Cutter agrees with him, that meat dyspepsia is the worst dyspepsia in the world, and when the patient is thus afflicted nourishment must be taken by some other way than by the stomach. It is totally and completely incapacitated. And neither of these last two named physicians favor the eating of the fat and white tissue in beef where the patient is not hearty. Dr. Cutter recommends "beef pulp." Dr. Garretson in his diet never experimented with living exclusively upon one kind of vegetable, and hence never suffered the evil results which Dr. Salisbury produced. The vegetable kingdom, or even a portion of it, contains all the elements of life and health which the human system demands, and whether meat shall be partaken of or not rests solely with the feeder.

FIGS AS FOOD.

THE MOST NUTRITIOUS OF ALL FRUITS EXCEPT THE OLIVE.

One of the Persian kings caused the celebrated Attic figs to be set before him whenever he dined, for one reason, to remind him that the land where they grew was not yet his and that, instead of receiving the fruit as a tribute, he was obliged to buy it from abroad; and, for another, that it was not only the emblem of health, but the most wholesome fruit grown. The fig is now pretty well-known to be, especially at certain seasons, almost the common food of the Italian people; and for months they may be said to live entirely upon them. It is not the superfluous, the luxurious, and thus, as Dr. Nichols says, it is not only possible for a man to live upon figs, but that, sitting under his own vine and fig tree, a man would have plenty of food and no landlord. When eaten fresh, it is a medicine as well as food; and they who eat them freely need no potions and no aperients. Full of nutrition and all those properties that make it valuable as an article of diet, we are confident that the fig will take a prominent position in the estimation of all who work for and believe in food reform. For myself, I would simply add that, again and again, without liquid of any kind, the luscious green fig, eaten with whole meal bread, has formed a dish at once simple but rich, and, like the Spaniard's salad, fit for a king. The fig is not only very popular, but it is the most ancient fruit we cultivate. In many countries the failure of this crop also means starvation and famine. Travelers in Asia Minor and southern Europe provide themselves with figs and olives as provisions for long

journeys, and not only live, but grow fat on the diet. The fig has more medicinal properties and more nutriment than any other fruit with the exception of the olive.—*Interior.*

ARTIFICIAL COFFEE.

ANOTHER ILLUSTRATION OF TEUTONIC YANKEE INGENUITY.

Of late artificial coffee-beans have been found in the European (German) markets. They are made from roasted grain flour with an addition of dextrine or some such body. There are two establishments at Köln which furnish the necessary outfit, with formula, etc., for the manufacture of the beans. According to an original letter from one of these establishments in the possession of Dr. A. Stutzer, in Bonn, from 1,000 to 1,200 pounds of beans may be made in one day with the outfit, which the firm offers at a high price. The letter further predicts a golden future for the article, but advises that it be used for the adulteration of genuine coffee only in such countries where the laws are not very stringent, etc. These prospects must be very enticing to sophisticators, especially as the imitation is so perfect that only a very critical examination will serve to detect the adulteration. The artificial bean distinguishes itself from the genuine in being perfectly symmetrical and of the same size, and that the epidermal membrane is entirely wanting.—*Ph. Central.*

JAPANESE HOTELS.

PRIMITIVE ACCOMMODATIONS FOR TRAVELERS IN JAPAN.

Our correspondent who has spent many years, as a resident and a traveler, in both China and Japan, supplies us with the following notes: There are no such luxuries as "gas, hot and cold water, and all the modern improvements," with only a few exceptions; these being recent erections, and for the most part in the mountain districts. The majority of hotels are alike, the difference being in the interior, and this being marked in the finish and neatness. Some of the hotels are very large, covering an extensive area; and although they are very often two stories in height, the upper one is not considered safe to live in. The front of the building is quite open to the street during the daytime. That which serves for the office is in the front room, the kitchen being also in the front of the building. There is nearly always to be seen hanging in the vicinity of the kitchen a list of charges for lodging. On a hot day the hotel looks very inviting, room after room being seen stretching backward. In the centre of the building is an open court, in the midst of which is a truly Japanese garden, fitted with rockeries of fantastic shapes, plants and flowers, and having a pond filled with gold fish. The parlor will be found at the back of the building, and the rooms are remarkably similar, having not a piece of furniture in them. At times the wood-work in the parlor is exceedingly pretty, and there are pictures, with occasionally a poem written in large characters in silk, hanging on the wall. The rooms are always scrupulously clean, and the floors of all Japanese houses, private or public, are covered with thick straw mats. As in Mohammedan countries, on entering any hotel or any house, the shoes must be removed, as a Japanese never wears anything heavier while in the house than a sock. Wherever there is any wood-work in the house, it is kept highly polished, as likewise are the verandas, which are indispensable accompaniments to the hotels of Japan, as by them the various apartments are reached. The wood is so exceedingly smooth that it will show the slightest scratch, or the mark made by a small nail in the shoe, as easily as a polished walnut or mahogany table would do. On entering a Japanese hotel, the visitor is conducted to a room, and immediately a girl waiter brings tea and cake. The

custom in Japan is to give a little present of money at this time, the sum being regulated in amount according to the degree of attention demanded. The prices for the lodging are generally fixed at stated sums for first, second and third-class lodgers, this sum including supper, breakfast and bed. Visitors do not remain in the hotel during the daytime, except at the summer and health resorts, and generally by eight o'clock in the morning the building is empty. Meals are invariably served in the different rooms, and this plan necessarily calls for a large number of waiting girls. The food is served on small, low tables just raised from the floor. The price of a first-class lodging, with meals, is, to the Japanese, about 37½ cents; but foreigners are charged for rent of room and for all meals served, which makes the bill considerably more than to a native, the difference in the prices being three or four times; while the majority of hotels prefer not to receive foreigners at all, though this barrier of exclusiveness is being gradually broken down. Chairs, tables and bedsteads are only found in the larger hotels, on the main roads of travel, and they have to be paid extra for. The ordinary accommodation is the floor, with two thick blankets; while the mosquitos, fleas and rats make a night's sojourn in a Japanese hotel a particularly lively one. The verandas of the houses are closed at night-time with a series of sliding wooden doors, and, as the building is usually surrounded by these, the visitor is in an almost air-tight vessel, while the odor that circulates through the apartment is sickening, making one wonder why it is that the Japanese, who are so clean in many matters, so persistently neglect sanitary arrangements, which are generally crude in the extreme. At one end of the open court is a sink, with basins, for the purposes of the toilet; while every hotel has its bath-room for the hot bath, of which the first arrival at night has the first use. Another disagreeable feature with Japanese hotels is that there is no possible way of fastening the sleeping apartment at night, there being no doors as understood in this country. The division between the various rooms, as between the apartments and the outer veranda, is nothing but paper—paper sliding doors, which can be lifted out of their grooves with the greatest of ease, thus converting the house into one large saloon. Notwithstanding this, and strange as it may sound, there is scarcely ever a robbery.—*Journal of Catering.*

WOOD PULP JARS.—An improvement has been introduced in the manufacture of battery jars from wood pulp which considerably increases their power of resisting the battery solutions while removing all danger from the leakage which has heretofore sometimes been the result of imperfect treatment. These jars are made from ground wood in the same manner as the well-known pails and similar utensils, but after having been formed and dried are treated by immersion in a composition which penetrates the pulp and renders the jar acid-proof. It has been found difficult in the past to insure in the case of every jar a thorough penetration of each fibre by the protecting compound, owing to the considerable amount of air which the fibres themselves and the space between them contain. This difficulty has now been happily surmounted by the ingenious device of treating the jars in a vacuum, whereby the air is removed, and then, while the jars are still submerged, admitting the air on top of the fluid used for treating. The air pressure thus forces the compound into every portion of the material forming the jar, and renders certain the protection of every fibre.

ELECTRIC PROSTRATION.—Several cases of electric prostration are reported from Creusot, France. It affects workers under electric light. The light exceeds 100,000 candle power, and it appears that it is this excess of light, and not the heat, which produces the nervous symptoms. A painful sensation in the throat, face and temples is first noticed, then the skin becomes peppery red, and irritation is felt about the eyes; much lachrymation ensues, and these symptoms then disappear, whilst the skin peels off in five days. The effects are comparable to those produced by walking over fresh snow in the sunlight, and may be regarded as a sort of "sun burning."

NATIVE RAISINS.—The raisin crop of California is estimated to be 904,000 boxes of 20 pounds each.

WOMEN VOTERS.

THE PLACES IN THE WORLD WHERE THE SUFFRAGE IS GIVEN TO WOMEN.

Both foes and friends of woman's freedom are unaware how far her suffrage has been gained. They never dream that her liberty covers an area greater than any of the famous empires of history, and than any of today. Both fancy that it exists mainly in one or two obscure nooks. To inform both, to abash foes and cheer the workers for the cause—and to enlighten and arouse the indifferent—the following facts have been toilsomely gathered by a writer in the *N. Y. Graphic*:

The slightest concession of the suffrage to any woman abandons the principle of sex disfranchisement. The matter then becomes merely a question how far such disfranchisement continues, and how long it will.

The large Province of Ontario touches the whole northern bounds of New York and Michigan, part of those of Pennsylvania, Ohio, Wisconsin and Minnesota, and reaches to Hudson's Bay. This great region, throughout which women vote (unless married) on like terms with their brothers for all elective officers save two, has a hundred and two thousand square miles. It is more than twice the size of New York; it nearly equals New York and Michigan together; it equals Massachusetts, New Hampshire, Vermont, Connecticut, Rhode Island, New York, New Jersey and Maryland.

In Wyoming women vote for every office for which their brothers do, and on the same terms. This great Territory has 98,000 square miles. It is half as large again as all New England; nearly as large as New England and New York; about equals New York, New Jersey and Virginia; is more than twice the size of Pennsylvania and Delaware; larger than North and South Carolina, than South Carolina and Florida.

Kansas, the State where municipal woman suffrage exists, contains 82,000 square miles. It is greater than the joint extent of New Hampshire, Vermont, Massachusetts, Connecticut, New Jersey, Delaware, Maryland, West Virginia and Rhode Island—of nine States of the Union combined—and greater than either of the original thirteen, than a majority of the thirteen together, and than either of thirty-two of the to-day thirty-eight.

But there is a greater region where women exercise suffrage, though not at polls. Many will be surprised to learn that this is—Texas! In that State the school officers are chosen by petitions to the county judge for their appointment, and he of course appoints those whose petitions are most largely signed. These petitions women, on the same terms with their brothers, can sign, and thus practically vote without leaving home. Texas has 265,000 square miles, and is larger than California and Oregon; nearly equal to all the Atlantic States but three; to all the other States on the Gulf.

In England, Scotland and Wales women (unless married) vote for all elective officers save one (member of Parliament), on like terms with their brothers. In Ireland women vote everywhere for poor-law guardians; in Dundalk and other seaports for harbor boards, and in Belfast for all municipal officers. In Sweden their suffrage is about the same as in Britain, and they vote, too, indirectly for members of the House of Lords. In Russia women, heads of households, vote for all elective officers and on all local questions. In Austria-Hungary they vote (by proxy) at all elections, including members of Provincial and Imperial Parliaments. In Italy widows vote for members of Parliament. In Finland women vote for elective officers. In British Burmah women taxpayers vote in the rural tracts. In Madras Presidency (Hindustan) they can do so in all municipalities. In Bombay Presidency they likewise can. In all countries of Russian Asia they can do so wherever a Russian colony settles. The Russians are colonizing the whole of their vast Asian possessions, and they

carry with them everywhere the "mir," or self-governing village, wherein women, heads of households, vote. Municipal suffrage now exists in New Zealand, and the Legislature has resolved that women shall vote for members of Parliament. It also exists in Victoria, New South Wales, Queensland and South Australia. The latter's Parliament has declared for women's voting at parliamentary elections too.

The Isle of Man, Pitcairn Island, Tasmania, Ireland, Sardinia, Sicily, Nantucket, Long Island and about two thousand different islands have various degrees of woman suffrage.

A pamphlet by the present writer, called "Freedom's Conquests," about to be issued, shows that the total area of regions where some form of woman suffrage exists is over 14,000,000 square miles, and that their population is nearly 300,000,000. This area is half as large again as the immense British empire; seventy-five per cent. greater than the vast dominions of the Czar; four times the size of all Europe or Australia; double that of both combined; almost equal to the North and South American continents together. Its population equals that of all North America, South America and Africa, and almost equals the population of all Europe.

AIR AND LIGHT.

THE NECESSITY TO HEALTH OF VENTILATION AND SUNSHINE.

If you find frosted window panes, damp pillows and walls, and feel languid, with probably a slight headache when you wake on a cold morning, you can feel pretty sure that the ventilation is imperfect. At this time of year the air is frequently shut out to keep out the cold, and many suffer from the ill effects of an insufficient supply of oxygen and the breathing of air charged with carbonic acid and other deleterious substances thrown off by exhalation. The evidences of bad ventilation may not be decidedly marked, but the silent and insidious injury to health goes on. A family can be comfortable with less heat and more fresh air than is generally supposed, and in rooms heated by furnace or stoves and lighted by gas too much care regarding ventilation cannot be exercised. Equally important with pure air in living apartments is sunshine. It carries with it radiance and cheer and vigor and good health. It is a purifier, warding off cold moisture, gloom, depression and disease. It should be admitted to every apartment of the house, and made welcome at all times. It is a strong preventative to the disorders that visit shaded and musty places. It brings health and happiness that cannot be obtained from any other source. It is nature's own health-giving agent, and nothing can be substituted for it. It has no artificial counterpart. It does not only touch the physical body, but it reaches the mind and soul and purifies the whole existence of man. It may fade a carpet or upholstery, but it will bring color to the cheek, light to the eye, and elasticity to the step. The closed and shaded window may throw a richness of color upon the room, but it will bring paleness and feebleness to the occupants. This health agent is free to all, easily obtained, and one of the most economic health-preservers we have, and ready to impart its efficacy at the rise of the curtain.—*Sanitary News*.

INK SHOWERS.

AN UNACCOUNTABLE AFRICAN PHENOMENON.

Writing from Grahamstown, Cape Colony, Mr. L. A. Eddie gives an account of some extraordinary showers that fell there on August 14 last. A storm commenced near mid-day and lasted till late the next morning. At intervals during this period heavy showers of rain fell, after which large areas were found to be covered with

water as black as ink. Two theories are put forward to account for the observed facts, one attributing it to dust in the air from a recent volcanic eruption, while the other considers the phenomena to be due to the passage of the earth through a dense meteoric stream, the dust of which suspended in the atmosphere was carried down by the rain, and, being essentially iron, formed, on being mixed with the organic acids of the soil, a true ink.—*Scientific American*.

THERMOMETERS.

WHAT THEY ARE AND HOW THEY ARE MADE.

The mercury thermometer is almost universally used as a temperature indicator in the temperate zones. The mercury, or quicksilver, used for the purpose is extracted from cinnabar ore, which is mined in California and Mexico. After undergoing a refining process it is packed in cans holding from one to five pounds each, and sells at wholesale at present for about 85 cents a pound. Mercury, however, is not used in thermometers intended for very cold climates, because it freezes at a temperature of 40 degrees below zero, though it answers all purposes for exceedingly high temperatures. When thermometers are intended for use in frigid zones, spirits have to be substituted for mercury. It is not known at what degree of cold the spirit thermometers will freeze and become useless, for cold of sufficient intensity has never yet been measured where a spirit thermometer has failed to work, even in a temperature of 70 degrees below zero. The spirits used in thermometers are extracted in the usual way from wood, potatoes and grain and are purely colorless. The red color noticed is imparted by aniline dyes, and this is done only for the purpose of rendering the spirits in the tube more easy to see. The addition of the coloring matter interferes somewhat with the sensitiveness of the fluid to atmospheric changes, and is not added to the pure white spirits contained in tubes of thermometers used for scientific purposes, and where the greatest accuracy and most minute variations are of great importance. At best, a spirit thermometer is not equal to a thermometer in which mercury is used, because it is not so sensitive and does not so readily respond to changes of temperature. The length of the glass tube has nothing whatever to do with the accuracy of the indications of a thermometer, and although some are scaled to indicate a temperature as high as 600 degrees above zero, the tube is made long only to afford surface for a scale upon which to mark the great number of degrees, and an instrument an inch long, carefully made, is just as accurate and responsive to variations of temperature as the long one; but it would require a microscope to make the readings. The smallest and most sensitive thermometer made, and the one having the greatest number of subdivisions on the scale, recording fifths of a degree, is that used by the physicians for taking temperatures of the human body. The sensitiveness of a thermometer increases with the relative increase in the size of the bulb. The large upright recording (Seixas) thermometers used by the United States Signal Service and at the various meteorological observatories have the bulbs filled with a mixture of ether and alcohol instead of mercury or spirits. A thermometer is made and adjusted by heating water to the boiling point, placing the glass bulb in the boiling water and then filling it with mercury, spirits or ether till it rises in the tube to 212 degrees—the boiling point. The freezing would answer the purpose equally well for adjusting a thermometer, but it is not used, because a temperature of 212 degrees is much more easily obtained than one of 32 degrees. Special thermometers of great accuracy and extreme sensitiveness are made for special purposes. Thus a thermometer with a scale running as high as 600 degrees is made for taking the temperature of ovens, and the chefs of hotels and restaurants, by computing the number of pounds to a piece of meat and the temperature of the oven, can tell how long to allow

it to cook and know exactly when it is "done to a turn." Brewers also use a specially made instrument with a register running as high as 550 degrees for taking temperatures of their mash tubs, while confectioners use a thermometer indicating as high as 450 degrees to ascertain when their candy has been boiled to a sufficiently high degree. There are three thermometrical scales in general use in different parts of the world. All English-speaking peoples make use of a scale invented by a German by the name of Fahrenheit, and named after him. The Germans tell whether it is warm or cold by a scale invented by and named for a Frenchman named Reaumur, while the French, Italians and others ascertain the temperature by a scale founded upon the metric system and called Centigrade. The following table shows the relative systems compared with each other at the boiling and freezing points:

	Water Freezes.	Water Boils.
Fahrenheit.....(deg.)	32	212
Reaumur.....	0	80
Centigrade.....	0	100

The Centigrade scale is used by scientists exclusively as being the most naturally arranged. The divisions being based upon the metric, or decimal system, the figures are much more readily handled than those of the Fahrenheit or Reaumur scale. The glass bulbs and tubes used for thermometers in this country comes from glass works in various States, but the greater number and those of the best quality are made at Rochester, N. Y.

INSECT LORE.

SOME POPULAR SUPERSTITIONS RESPECTING INSECTS.

The Koran says all flies shall perish save one—the bee fly.

It is regarded as a death warning in Germany to hear a cricket's cry.

The Tapuya Indians in South America say the devil assumes the form of a fly.

Rain is, in some parts of the country, expected to follow unusually loud chirping of crickets.

Flies are regarded as furnishing prognostications of the weather and even of other events.

Spaniards, in the sixteenth century, believed that spiders indicated gold when they were found in abundance.

In Germany it is said to indicate good luck to have a spider spin his web downward toward you, but bad luck when he rises toward you.

Although a sacred insect among the Egyptians, the beetle receives but little notice in folk lore. It is unlucky in England to kill one.

The grasshopper is a sufficiently unwelcome visitant of himself in this country, but in Germany his presence is further said to announce strange guests.

The ancients generally maintained that there was a close connection between bees and the soul. Porphyry speaks of "those souls which the ancients called bees."

German tribes regard stag beetles as diabolic, and all bees are detested in Ireland, more especially a bronze variety known as "gooldie." It is also believed that to see a beetle will bring on rain the next day.

STEAM DISINFECTION.—The experiments of steam disinfection, recently tried in Jacksonville, have proved that the steaming process is thoroughly efficacious in destroying microbes in general, and also the yellow fever microbes. Active germs placed by Dr. Gibier in a gelatine-filled glass tube germinated, showing unmistakable life and activity. Microbes subjected to the steaming process, though for only ten minutes, and under very imperfect conditions, were afterward subjected to the same cultivation, but remained entirely inert.

CIGARETTE FIENDS.—It is said that people who eat garlic and smoke cigarettes will never be attacked by yellow fever. Perhaps not; but such people ought to be quarantined, all the same.

LENGTH OF LIFE.

WHAT THE DOCTORS THINK CONCERNING THE PROLONGATION OF HUMAN EXISTENCE.

The primary purpose of pathologists and medical savants is the prolongation of human life, and within the past cycle rapid progress has been made toward the elimination of this problem. Epidemics are not only controlled but prevented; sanitary and hygienic laws have been formulated and proven; the cause of maladies discovered and their treatment determined; the average length of life increased, and the death rate percentage lowered. Life is more exhausting in its demands than formerly, more intense, hurried and exciting, or the advancement of vitality and longevity would be more marked and apparent. The rapid dissemination of ideas, the facilities for travel and observation, the demands of citizenship, all the friction of modern life, with its rapid and unceasing series of impressions, call for constant exertion, which leads to fatigue, premature wear and decay, finally death, and with the idea of the prevention of these divers infelicitous results as a nucleus, have been promulgated a nebula of most contradictory and confounding theories. There is the man who drinks only cold water, the man who drinks only boiling water, and the man who drinks no water at all, each living to a remarkable age, and each advocating their own particular Ponce de Leon fountain; vegetarian dietetic cranks, like the physician Sanctorius, spending their lives in a pair of scales weighing their food, of whom Dr. Shradly of this city said, "that the prolongation of life was to a certain degree dependent on their elimination, for they would with their patent foods and nostrums debilitate the stomach and impoverish the vitality of the whole race, could their enthusiasm be unrestrained;" men who have attained great age through the invigorating results of frequent baths, and centenarians who have lived, not because of a lack of bathing, but in spite of it. One's faith in the beneficial effects of exercise even is shaken by the authentic account of one Rev. William Davis, of Hereford, aged 105 years, who for the last thirty-five years of his life took no exercise at all, ate hearty food, and never had rheumatism or paralysis. A little while ago it was distilled water and phosphoric acid that was to prolong our lives beyond the allotted three score years and ten; but now it is the use of common salt, according to Dr. Burggraave, that is to prevent all disease and ultimately result in centenarianism. But it was reserved to Dr. Villerme, of Paris, to discover that comfortable living, in the most complete sense of the word, was the surest and most potent agent in the prolongation of life, and with his diagnosis modern physicians concur most emphatically.

Dr. Hammond had some peculiar and utopian ideas of longevity, which unfortunately have not the corroboration of actual experience. His theory is that the natural waste of the different organs in the physical system which occurs in the performance of their various functions can be estimated and analyzed, and that it can be supplied by artificial means so exactly that a man might live interminably if he would submit to the conditions and restrictions required. But the medical fraternity are skeptical concerning this theory, and claim that the body is a kind of machine which, if carefully used, never overstrained or overworked, all its wheels, pistons and valves kept well lubricated and free from foreign deposits, and its driving power carefully supplied with the fuel that produces most force, will endure for many years longer than if abused and neglected, like a delicate machine in the hands of a clumsy apprentice. They say, too, that men are learning rapidly something of the mechanism of this wonderful apparatus, and to understand that if one wheel or set of wheels are used constantly they will wear out first and use their usefulness. A bank clerk who continually uses that portion of his brain with which he makes arithmetical calculations wakes up some morning unable to think at all and

too ill to pursue his avocation. The wheel he calculated with has tired out and is set fast, and the rest of the machinery has become clogged and rusty from disuse. The old-time physician would put leeches or blisters on his head and give him an anodyne to stop his sufferings. The modern physician sends him into the country, oils and cleans up the rest of the machine, sets it all in motion, and by and by the little worn-out wheel gets to whirling again as merrily as the rest. But in spite of every scientific precaution a man cannot prevent certain physiological changes which ultimately result in death. The elasticity of the arterial coats slowly diminishes, his liver decreases in size, the patient pump in his left side gets worn in the valves and wheezy, and the machinery is rubbed so thin by constant friction that a little strain snaps a pulley or lever. According to the prophet, "the grinders cease because they are few," and "the grasshopper shall be a burden, and desire shall fail, because man goeth to his long home," notwithstanding all plausible and cunningly devised theories. Another argument is that nature's forces cannot be satisfactorily supplied by artificial means, however scientific. No one ever walked as well on a wooden leg as on one of flesh and blood, and the internal organs are equally embarrassed and awkward by the introduction and assistance of the most kindly disposed foreign agent.

Dr. Fordyce Barker and Dr. Shradly both agree that the average length of life is increasing; that people are learning to take better care of themselves; that cities are more sanitary and hygienic; that plagues and pestilences are to a great extent prevented and controlled, and that that life is most vital and prolonged in which every organ is equally and harmoniously exercised, not in unnatural haste and eagerness, but in congenial and continuous energizing action.

Dr. Barker says: "Waste is as essential to life as repair, and as waste is only brought about through exercise, that work is the best life promoter and preserver."

Dr. Shradly aptly illustrates this axiom by saying: "To make your grate fire glow with life and warmth, you must rake out the ashes and cinders before you put on more coal. It doesn't do any good to keep heaping on more fuel when there isn't any draught." He also says that "it is extremely difficult to lay down general rules for the prolongation of life or the preservation of health, because the physical being of each individual is peculiarly his own and unlike any other. You might as well try to fit all men with the same coat. It may be a very good-shaped garment, but it will pinch one man in the shoulder and be too short for some one else in the sleeves. You can't put a square peg in a round hole, and you can't make the diet that suits one man nourishing to every other man. The farmer following his plough in the crisp spring air comes in and eats a good dinner of corn beef and cabbage or a piece of pork that would kill a professional man, and enjoys it because he needs it. His blood is bounding through his veins calling for nourishment; every muscle is in a state of activity, and his stomach wants to act, too—wants something to chew on, and if it gets out of work when everything else is in motion it becomes clamorous and painful, and the cabbage is good occupation for it. Whereas the professional man, in a state of inactivity, doesn't want to feel a hundred little wheels buzzing in his stomach when all the other machinery is still. Physicians are learning to help men to live comfortably within their environments and conditions, helping them too much, I think, sometimes, for they produce a sort of survival of the unfittest in the prolongation of the lives of chronic and suffering invalids, cripples and consumptives, who must suffer until they die, and whose misery should in mercy be shortened. The science of medicine has become greatly revolutionized, and the physician of to-day must understand something besides the application of leeches and blister and the use of the lancet. Modern study and research is devoted largely to the discovery of the cause of disease and to the quickest and surest methods of eliminating its cause rather than in temporarily relieving its discomfort; and the prevent-

ing of disease rather than its cure is the great aim of every pathologist. I have several patients who come to me regularly, even if they are in good health, to have me advise them concerning the best means of living with a view of prolonging life, to have me look over their machinery and see if it is all sound and in good working order. I am a kind of an engineer, putting on a little oil here, tightening up a screw there, in the intricate and beautiful machine which is best off when least tampered with. You know the nervous man who is always looking at the works in his watch gets dust in and then he needs must blow the dust out, and this creates moisture. The moisture produces rust, and the jeweller tinkers away at it to get the rust out, and there's always something the matter with that man's watch. So nervous people, continually interfering with nature's true processes of life, usually succeed in keeping their system continually out of order. An inactive person suffers from indigestion, perhaps slightly, from simple want of exercise, and so he feeds himself on some of the advertised patent foods, which simply put his stomach in a sling, figuratively speaking. Put your arm in a sling for three days and it will pain you from simple lack of exercise. Take it out and do violent work and it will pain you then through weakness. Because it pains you, tie it up three days more, and try it again. More pain, more weakness, the course persisted in for some time, and a helpless arm results. So the sedentary man puts his stomach in a sling with his patent, half-digested food. Of course it pains him, for nature resents inactivity, and of course the longer it is kept idle the more helpless it becomes. The diet I recommend to a healthy man or woman is that which his or her appetite craves, and I would have them live in utter unconsciousness of any of the organs that perform the functions of the body unless sharply reminded of them by disease. Food should be varied in character, appetizing and nourishing. Eat what the sentinel of your appetite admits, and, if it proves to be an enemy, see if in some way you cannot conciliate it by the exercise of the rest of the machine. The man who is always examining with a microscope the water he drinks, groping for microbes in the dust about him, and every time he catches a little smell of onions stealing up from some area, pours peppermint in the pipes under the delusion that he smells sewer gas, has a kind of mind malaria, and doesn't live out half his days. Interest yourself in some wholesome, active, congenial employment that will call into execution the best powers within you. Complement the activity awakened in a portion of your machinery by this work with some kind of pleasant and interesting exercise for those organs not called into execution, and, above all, don't worry, don't hurry and strive, but extract all the enjoyment possible out of each day's life, and your life will be prolonged in peace, and not misery of disease and pain. Women are deteriorating in vitality and longevity, and it is largely due to the nervous strain they are continually under, to their vanity and love for dress and display, no matter how injurious its requirements are to their comfort and well-being. But there is already the dawning of a better intelligence among some of them, and it is to be hoped that it is the beginning of a better era. I have a patient who, although 92 years of age, still retains the possession of all his faculties, enjoys his life, has no disease, and has an ambition to become a centenarian that sends him around here occasionally to be looked over a little to see if there are any loose screws in the life machine. He is a man who has lived well and temperately, with sufficient means to enjoy the comforts of life and the rare judgment to make the most of each day's opportunities. He is very affectionate toward his wife, with whom he has lived happily for more than fifty years, and his pleasant home and family relations have, I think, been one of the causes of his long existence. I think it is a mistake to consider that a man's career is ended at 70, for many men have had the most brilliant successes after that age. Army officers are, in my judgment, retired too early. Gen. Sherman is

more capable of commanding the forces of the United States to-day than he was when he led the army through Georgia, and none dare question his bravery. There is a peculiar instance illustrating this point of an old man, who, feeling that his course was nearly run, divided his property among his sons, retaining only so much of it as he needed for the few remaining years of his life. Before he died he had by his shrewd business tact increased his little fortune to its former size and died possessed of more money than his sons ever acquired. Disease is a mean fellow; it always strikes a man when he's down. Two men come into a car together—one overworked, depressed, worried and exhausted, the other interested in his work, which employs every faculty to the uttermost, comfortable and happy, with the conviction that his wife is the dearest woman in the world, his children as bright as any one's children, and that he isn't a very bad sort of a fellow himself. A draught blows through the car as usual, striking both men. They both take cold. One has pneumonia and dies, and the other a cold in his head, which he sneezes away in two days. It is easy to draw the inference and with it to deduce the formula that comfort, cheerfulness and hopefulness are the best promoters of existence.

Dr. Humphrey, of Great Britain, gives his premises for longevity as follows:

"First—The prime requisite is a faculty of age inherited in the blood. The body must be wound up and sent into the world with the initial force necessary to carry on the living processes through a long period; that the several organs be so adjusted to one another as to form a well balanced whole, and that the functions be so harmoniously performed that there will be no cognizance of imperfection or ailment.

"Second—The body must be well developed, capable of much endurance and of quick and complete restoration from fatigue, the nervous system energetic, and the intellectual powers correspondingly developed.

"Third—Owing to the inherent good quality of the nutritive processes, degenerate change will be slow to manifest itself if to the foregoing be added ordinary opportunities of living well, under sanitary conditions, together with temperance in meat eating and alcoholic beverages."

DEW AND FROST.

A POPULAR EXPLANATION OF THEIR OCCURRENCE AND CAUSE.

If, after a clear, cool night, we observe the surface of the ground, we often find it covered with moisture, as if it had rained during the night. This familiar phenomenon, known as the fall of the dew, is dependent upon some very interesting and important scientific principles. Air possesses the property of holding a certain amount of water vapor, the quantity depending upon the temperature. If, at a temperature of 60 deg., for instance, a cubic foot of air held as many grains of water in the form of vapor as it was possible for it to do, it would be said to be *saturated*, just as a quantity of water would be saturated with salt when no more of that substance could be dissolved in it. Now, if the temperature of the air was increased to 70 deg., its power of absorbing water vapor would be increased; and if it was in contact with water or a moist substance, evaporation would commence, and continue until the air was saturated once more. If, on the contrary, the temperature of the saturated air was lowered, it would become more than saturated, and the excess of water vapor would be precipitated out in the form of finely divided particles. One of the most familiar examples of this phenomenon is shown by our breath on a cold morning, when the water vapor in the warm, moist air from our lungs, on passing into the colder outside air, condenses in the cloud-like form so frequently observed. When this takes place in nature, on a large scale, by a cold and a warm body of air coming together, fogs,

clouds or rain are produced. It is a curious fact that the water thus precipitated from a state of vapor is not in the form of little drops, but of hollow vesicles, as they are termed, like minute soap bubbles. This peculiar form is common to condensed water vapor, whether in the form of steam escaping from a tea kettle or boiler, or the fogs and clouds which float in the air. It is only when the vesicles unite together that ordinary drops are formed. This vesicular structure probably helps in maintaining the clouds at their high elevation. Whatever the quantity of vapor in the air, there is a certain temperature at which the vapor begins to precipitate, known as the *dew-point*. If a goblet filled with ice water is brought into a warm room, the air immediately surrounding it is cooled below the dew-point, and a copious deposit of water is formed upon its sides. This water does not ooze out through the glass, as some people suppose, but is squeezed out of the air, as it were, by the cooling effect of the ice. We thus see that it is only necessary to cool the air sufficiently to obtain a copious deposit of moisture, and if the temperature of the ground should fall low enough, dew would certainly be precipitated upon it; but it is noticed that dew falls upon warm nights, when the temperature of the air is far above the dew-point. What, then, causes the cooling of the earth upon which the dew is so abundantly deposited? This is best explained by the principle of radiation. If we hold our hand at some distance from a block of ice, we shall feel the cold very perceptibly. The hand radiates its heat towards the ice, which absorbs it so rapidly that the temperature of the hand is lowered, and a sensation of cold is felt. Now, just above the comparatively thin stratum of air which surrounds our earth are the regions of space, where the temperature is far lower than any with which we are acquainted; and it is to these cold regions that the heat of the earth, the grass, and other bodies is radiated in the clear summer nights, after the heat of the sun is withdrawn. As they become cooled by radiating away their heat, they reduce the temperature of the air surrounding them below the dew-point, and the dew is thus precipitated, not by "falling," as the common phrase implies, but from the air immediately in contact with the object on which it is deposited. This theory of the formation of dew also explains many of the accompanying phenomena. A gentle wind favors the deposition of dew, as it brings fresh supplies of moisture-laden air into contact with the cold earth or foliage. A brisk wind, on the contrary, prevents its formation, as the air does not remain long enough in contact with the cool bodies to deposit its moisture. No dew falls on cloudy nights, because the clouds act as a screen, and prevent the radiation from the earth's surface to the colder regions beyond. It is noticed that the dew is not deposited in equal quantity upon different substances. A bright piece of metal exposed on the ground will remain quite dry, while the surrounding grass will be loaded with moisture. This is due to the fact that different substances possess different capacities for radiation. In general, it may be said that dark-colored, rough bodies are good radiators, while smooth, bright substances are poor ones. Air also is a comparatively poor radiator, or else it would cool itself down below the dew-point, and form fogs, much more frequently than at present. Hoar frost is, of course, simply frozen dew. In the spring and autumn the temperature of the earth may not only fall below the dew-point of the air, but even below the freezing point of water. The flocculent form in which hoar frost is often deposited shows that the ice has been formed directly from the condensing vapor, without passing through the intermediate stage of water. In some parts of India ice is manufactured by this means: Shallow earthenware dishes of water are exposed to the clear sky at night, and the water is often frozen even when the temperature of the air is as high as 50 deg. Fahr. Early crops are often frozen in the same way; and farmers sometimes build bonfires in their fields at night, so that the smoke shall form an artificial cloud, and prevent the radiation and consequent cooling. Finally, the beneficial effect of the heavy dews of midsummer to the crops, when parched with drought, is of great value, and they replace to no small extent an insufficient rainfall.—*Pop. Sci. News.*

DOMESTIC DIETETICS.

SPECIALLY PREPARED, FROM PRACTICAL TESTS, FOR THE
LADY READERS OF THE "AMERICAN ANALYST."

SEASONABLE FOOD.

January.

MEATS.—Beef, mutton, ham, kidneys, liver, venison, sausage, pork.

GAME AND POULTRY.—Grouse, hare, pigeon, quail, chicken, duck, turkey, rabbit, goose.

FISH.—Bream, cod, crabs, eels, carp, flounder, halibut, herring, lobster, mackerel, mussels, oysters, perch, pike, rock-fish, salmon, smelt, whitefish.

VEGETABLES.—Artichokes, beets, beans, cabbage, carrots, cauliflower, celery, garlic, lettuce, onions, parsley, parsnips, potatoes, shallots, spinach, squash, tomatoes, turnips.

FRUIT.—Apples, bananas, grapes, oranges.

PRACTICAL RECIPES.

CLAM BROTH.—Chop fine, twenty small, hard shell clams, add a pint of clam broth or hot water, and a pinch of cayenne (no salt); simmer thirty minutes, strain and serve the clams on buttered toast. Serve the broth in cups. A little butter may be added if desired.

STEWED EELS.—One eel, two dozen button onions, a few mushrooms, yolks of three eggs, white wine, salt, spices, herbs, juice of two lemons. Skin an eel; cut it into pieces, and boil in the white wine seasoned with the salt, spices and herbs. Brown the onions in an earthen pipkin; season and besprinkle with flour; then add the gravy the fish was boiled in, and let simmer gently. Put the pieces of eels in, adding the mushrooms. Let boil for ten minutes, and finish with the egg yolks, mingled with the juice of two lemons.

TURKEY HASH.—Stir a piece of butter, rolled in flour, into a small quantity of milk or cream, and add thereto a little veal gravy. Let this boil up; meanwhile mince finely some cold roasted or boiled turkey, but not too small. Put into it the sauce, to which add grated lemon-peel, white pepper, pounded mace, a little mushroom ketchup, or mushroom powder, simmer it up and serve. Oysters may be added.

PUFFS.—Take a pint of milk, and when it boils stir in as much flour as will make it a thick batter. Add three well-beaten eggs, and two or three drops of oil of cinnamon, or any other flavoring. Dust a large flat plate with flour, then with a spoon throw on it the batter in the form of balls or fritters, and drop them into boiling clarified dripping or lard. Serve them with grated loaf sugar strewed over. The batter may be made into a pudding, adding with the eggs one ounce of salt butter. Boil and serve it with a sweet sauce.

BIRD'S-NEST PUDDING.—Pare five apples, enough to fill the pudding dish, remove the cores with an apple corer, and steam until tender. Make a custard of three eggs and milk enough to nearly cover the apples; sweeten to taste, add salt and nutmeg to season, and bake until the custard sets.

VELVET CREAM.—Dissolve half a box of gelatine in one coffee cup of milk over the fire; add the juice and grated peel of one lemon. When the gelatine has dissolved put in one coffee cup of white sugar. Let it cool slowly; strain it and add one and one-half pints of rich milk. Stir until cool, then pour into a mould previously wetted. Vanilla may be used instead of lemon.

DELICIOUS CAKE.—Two cups of white sugar, one cup butter, one cup milk, three eggs, three cups flour. Stir butter and sugar together and add the beaten yolks of eggs, then the beaten whites. One teaspoonful of Horstford's baking powder sifted. With the flour flavor with the grated rind of a fresh lemon and half the juice.

WHAT BEEF COSTS.

THE PROFITS OF THE RETAIL BUTCHER EXHIBITED IN
DETAIL.

The subjoined article, which appeared in the AMERICAN ANALYST of January 10th and 24th, has attracted such wide attention and has evoked such numerous orders for copies of the issue containing it, that in order to meet the demand we feel constrained to again republish it:

The question has frequently been asked why it is that when the newspapers quote the wholesale price of beef at from four to seven cents a pound, the consumer is compelled to pay as much as twenty or twenty-three cents a pound. To answer this question intelligently the AMERICAN ANALYST detailed one of its staff to make the necessary inquiries, and we give herewith the itemized results. A carcass of beef, weighing 750 lbs., cut into loins, rounds, chucks, ribs, plates, shanks, flanks, kidneys and necks, will make the following product, at the retail price stated. The average wholesale

price of such a carcass in New York is seven cents, or \$52.50 for the carcass, which, when retailed, as shown by the table subjoined, would make \$92.12, or a profit of \$40.62 upon an investment of \$52.50, which would certainly appear to the outside observer as a pretty good profit to the retailer. It is true that from this profit must be deducted the expenses of the retailer's business; but nevertheless, it also proves conclusively that the retail butchers have no grounds for complaint against the Chicago dressed beef men, nor can the public have unless it is that the prices of meat at retail stores are as high as they were when cattle sold at higher prices; but the remedy for this should be demanded of the retailer, whose prices have not been reduced in proportion to the wholesale price. We may add here that the retail prices given are the lowest prevalent, and where there is any variation, it will be found that the prices demanded by retail butchers are somewhat higher. In any case, it should be borne in mind that as for quality Chicago dressed beef is always the best, having the advantage of more careful selection, better dressing, and consequent tenderness.

RAISIN WINE.

HOW IT IS RECOGNIZED AND DETECTED.

The report of the Union of Swiss Analysts upon food adulterations published in the *Reveu International des Falsifications* of October 15, 1888, contains the following reference to raisin wine:

The manufacturing of wine made of dried raisins having extended from France over Switzerland and other countries, necessitates chemists to pay due attention to it, as the manufacturers pretend that this spirituous liquid cannot be ascertained by chemical proceedings. It has, however, been proved several times that, after some practice, the wine of dried raisins can be distinguished from natural wine by chemical analysis. The case is, however, rendered more difficult, when a mixture has to be ascertained, and this is utterly impossible when the natural wine predominates. The following rules resulted from the discussions on this subject. Wine of dried raisins distinguishes itself by the extraordinary proportions in its composition, chiefly by a great quantity of sugar and volatile acids. The mineral substances almost ever contain a larger quantity of chlorides, lime and iron, than other wines. The wine of dried raisins must be regarded as an artificial wine. This second rule is based on the fact, that the said wine is often made of drugs, and in some cases the quantity of these drugs prevail.

NATURAL GAS.

THE GREAT COMMERCIAL WONDER OF THE DAY.

People often talk of the advantages of natural gas as a fuel without having an adequate idea of its importance. It is to-day the greatest commercial wonder of the age. No one can ponder over the following figures without being deeply impressed: It is only fifteen years ago, says the editor of *Stoves and Hardware*, published at St. Louis, that natural gas was first used as a fuel, yet to-day there is required to pipe it 27,350 miles of mains. In Pittsburg alone 500 miles supply 42,698 private houses, 40 iron mills, 37 glass works, 83 foundries and machine shops, and 422 miscellaneous industrial establishments. An idea of its value as fuel can best be obtained when the value of 7,000,000 tons of coal is estimated, as it is asserted that this amount of coal is annually displaced by natural gas. An idea of the effect a retarded production has in advancing prices can be seen in the shut-down movement in oil production. This commenced in earnest just about a year ago, and the following is the result: In 1886, when no attempt was made to lessen production, the average run from wells was 70,666 barrels per day. In 1887, when there was less than two months' organized effort in this direction, the average daily run was 63,545 barrels. In ten months of 1887, ending November 1st, when the movement was on foot in earnest, it was less than 44,000 barrels per day. The average price of certificates for the first ten months of 1887 was 64½ cents. For the first ten months of 1888 it was 87 cents, an increase in value of 34½ per cent.

FOOD PRESERVATIVES.

THE EFFECT OF ANTISEPTICS UPON THE DIGESTIVE FUNCTIONS.

In a pamphlet on the effects of food preservatives on digestive agents, by Henry Leffman, M. D., and William Beam, M. A., the authors say that the use of antiseptics in perishable articles of food has become quite general in recent years, and has been to a certain extent the subject of legislation. Salicylic acid has been probably the most used; and while the sanitary authorities in different countries have, as a rule, opposed its use, there has been no positive evidence of its injurious action, even when continued for some time. Lehmann published in Pettenkofer's *Archives of hygiene* several instances in which healthy male adults had taken for many days considerable doses of this acid without apparent injury. While there may be a legitimate field for the use of these agents in articles of food in a highly perishable character, and especially where the addition is made known, there can be no question that their indiscriminate use is dangerous. Independently, however, of any directly injurious action, it is important to inquire how far they may interfere with the nutritive or medicinal value of any articles with which they may be associated. The matter has been brought prominently to the notice of these chemists, in consequence of some analyses made by them in which the free use of salicylic acid in beers and malt extracts was detected. Similar results in regard to beers were found by various State boards of health and by the Department of Agriculture of the United States Government. It becomes important to inquire how far the presence of the substances may interfere with the diastatic action ascribed to preparations of malt. Of eleven samples tested, including all the extracts widely known in this market, only four had any appreciable effect on starch, and but one of these was strikingly efficient. They have undertaken to determine what retarding effect such preservatives may possess. The antiseptics selected were salicylic acid, boric acid, sodium acid sulphite, saccharine, beta-naphthol and alcohol. The sample of beta-naphthol was of the form now sold under the name 'hydronaphthol.'

From the experiments it will be seen that salicylic acid prevents the conversion of starch into sugar under the influence of either diastase or pancreatic extract, but does not very seriously interfere with peptic or pancreatic digestion of albumen. Saccharine holds about the same relation as salicylic acid. Sodium acid sulphite and boric acid are practically without retarding effect. Beta-naphthol interferes decidedly with the formation of sugar by diastase but not with action of pancreatic extracts on starch. Peptic and pancreatic digestions of albuminoids were almost prevented by this agent. It is obvious from these experiments that the indiscriminate use of these agents in the preservation of food is to be regarded as objectionable and a proper subject of sanitary supervision. Their use is scarcely allowable under any circumstances, and certainly only when the nature of the preservative, and the amount are distinctly stated. These remarks apply more particularly to salicylic acid, saccharine, beta-naphthol; but the use of boric acid and sodium acid sulphite may be brought also under the same restrictions, because their actions on the animal functions are not yet thoroughly investigated.—*Science*.

IS LIFE INSURANCE SAFE?

A COMPANY INCREASES ITS DIVIDENDS AND SURPLUS IN THE FACE OF HALF A MILLION LOSS.

When we read official statements like the one subjoined, made last week by the President of one of the most conservative institutions in the country, the question naturally arises: If a mutual company can afford to lose nearly half a million of dollars, and yet increase its surplus and pay its policy holders a larger return than usual of what they have overpaid, how much has life

insurance cost in such a company more than it would have cost in a company which had no such loss? and can an insurer in such a company reasonably hope that his family will be promptly paid in full, without quibbling?

HARTFORD, Conn., Jan. 24.—Col. Jacob L. Greene, President of the Connecticut Mutual Life Insurance Company of this city, made the following announcement this evening:

"It has just been discovered that the financial correspondent of this company at Indianapolis, after sixteen years of service, is a defaulter. The extreme amount involved is \$500,000. He has restored to the company property which may reduce the actual loss to \$400,000. The amount of the loss will not in any degree affect the company's solvency, nor even interfere with its regular dividends. The past year has been very prosperous, and in spite of this unexpected loss the company will make a heavy gain in assets, pay a larger dividend than last year, and probably increase its already large surplus. Its forthcoming annual statement will show assets of the most solid character amounting to \$57,000,000, with a surplus of about \$5,250,000."

TRUSTFUL.—Mrs. Della Creme (wearily): "I know everything we eat is adulterated; but what can we do, Reginald? We must trust our grocer." Mr. Reginald Creme (drearily): "Ah, yes, Della, very true; and if—oh, if—our grocer would only trust us!"

THE latest thing in homeopathy is the administration of snakes, instead of whiskey, as a remedy for delirium tremens. The remedy is certainly a logical one, from the standpoint of *similia similibus curantur*, and is scarcely more ridiculous than some of the other remedies employed by that school.—*Medical Age*.

HIGH PEAKS.—According to the latest accounts the highest mountain peak on earth is Mount Hercules, in New Guinea, which is 32,768 feet high. Mount Everest, of the Himalaya range, Asia, long called the highest peak, is only 29,002 feet high. How long will Mount Hercules rule as the king of mountain peaks?

ROMAN REMAINS IN ENGLAND.—A recent discovery in Bath, England, is the recently unearthed Roman baths. They are in almost complete preservation; the lead lining and lead piping nearly perfect, the steps, the columns, the carvings, in wonderful preservation, and the whole probably forming a more complete specimen of this class of Roman work than exists anywhere else.

ANOTHER TERRIBLE POWDER.—At the Royal Powder Factory of Wetteren, in Belgium, a new gunpowder is being made. They call it poudrepapier, or paper-powder, and it is said a charge of 2½ grams (39 grains) gives, in a rifle of small calibre, an initial velocity of 660 yards to the ball. This is equal to, if it does not beat, the Lebel powder. The additional advantages are attributed to it of not smearing the barrel, of producing no smoke and of causing little recoil.

THE HOUR OF DEATH.—It has been said that the greatest number of deaths occur between four and six o'clock in the morning. As a matter of curiosity, and to ascertain whether there is any truth in this statement, Dr. Charles Féré has tabulated the hour of death of all the patients dying in two of the hospitals in Paris for the past ten years. He found there was no preponderance of mortality at any particular hour, although there were somewhat fewer deaths between seven and eleven o'clock in the evening than at other periods of the day.—*N. Y. Medical Record*.

CLOTHES-PINS.—Where do all the clothes-pins go? Innumerable dozens of them are flowing out in the world continually from the factories, and a single expert packer handles 72,000 of them in a day, packing 100 boxes at a cent a box. They are made of ash, beech, birch and maple. The logs are cut into lengths of 31 inches, these are sawed into blocks, the blocks into sticks and the sticks into shorter ones, the length of the clothes pin, about 5½ inches. These are fed into a lathe by an endless belt. The lathe turns them into shape and passes them along by a turn-table to a saw which cuts out the slot. When the machine is through with them it drops them into a box or barrel. The pins are then dried in a drying house and then put, 20 to 40 bushels at once, into a slowly revolving cylinder, and the friction caused by their tumbling about in this cylinder polishes them. A single plant for making clothes-pins costs from \$1,000 to \$12,000. But what becomes of the pins?

CAUGHT BY A LOAF.—A loaf of bread has just played an important part in the detection of a most brutal murder. It appears that some time in August last a poor laborer's wife was cruelly murdered in France for the sake of the few francs she had in her pocket. Suspicion pointed to a tramp who had been seen in the neighborhood, and who, a few hours after, was proved to have spent in a wine shop the, for him, important sum of three francs. The suspected man was arrested, but the magistrate had little or no proof against him. Only a very little proof, consisting of a hunk of bread that had been found near the victim. The servant of a neighboring farm-house deposed that the bread had been given by her to the man. "Could she swear to the bread, and on what grounds?" asked the magistrate. She could swear to the bread on the following grounds: The brick floor of the oven in which the loaf had been baked was minus one brick. Part of the dough had bulged out in a particular fashion during the baking in consequence thereof, and she noticed the fact when she cut it and handed it to the beggar. The Assize Court of the Department of the Loire et Cher therefore condemned the man to death.

BUSINESS NOTES.

SPURIOUS "ACID PHOSPHATE."

OFFICE OF DR. MORRIS H. HENRY,
581 FIFTH AVE., NEW YORK, Oct. 27, 1888. }

MR. N. D. ARNOLD, Rumford Chemical Works, Providence, R. I.

My Dear Sir: I am very glad, indeed, to see that you have issued a caution to physicians who prescribe "Acid Phosphate." The notice is timely. Within a few months I have seen cases where spurious preparations were (unwittingly) used without benefit. My own experience in the administration of your preparation dates back to 1870. I think I was one of the first to call especial attention to their great value as a beverage at meals, to assist digestion, to avoid dyspepsia, relieve nervousness, and as an aid to induce sleep. I have had no reason to change my views. My additional years of experience have confirmed my first impressions.

I am, my dear sir, faithfully yours,
(Signed) MORRIS H. HENRY.

REMOVAL.

Frank LaMauna, the sole agent in the United States for the celebrated Billet Sardines, J. Le Marchand boneless Sardines and Gourmet Olive Oil, has removed his offices to 24 State Street, New York, and has taken Messrs. Arthur Azema and Jules Farnan in partnership with him. The business has become so large as the demand for these goods has been rapidly extended, that no one man could handle it: hence this new arrangement. As no better nor purer goods are imported, this explains the large popular demand for them.

HORSFORD'S ACID PHOSPHATE.

IN DIGESTIVE DISORDERS.—Dr. E. V. Wright, Saratoga Springs, N. Y., says: "I have used it for years, and my experience has proved, beyond question, that the peculiar combination of phosphates renders it most valuable in the treatment of digestive disorders."

CUTTER WHISKEY.

This celebrated brand of whiskey has now been before the public for many years, and has stood the crucial test of the taste of the better classes. Distillers may say what they please, and editors may write the most scientific dissertations on whiskey, but, after all, the whiskey which best suits the consumer is the one which will have the command. It must always be the same shade and flavor, and no evil results must follow its use. To do this it is necessary for those who put up such a whiskey to have good judgment in selecting the whiskey, plenty of capital to invest when such goods as they desire are in the market, experience in knowing where such whiskey may be found, and a determination to be honest under the greatest temptation. It can be readily understood that where such a business has been once successfully established, a little laxness of conscience would bring enormous profits, and might be carried on for some time without detection. Thus we have established an ideal, and we can honestly point to the owners of the Cutter whiskeys trade mark, Messrs. C. P. Moorman & Co., of Louisville, as having done precisely what we say. They have placed the Cutter whiskey in the front rank of whiskeys and have steadily maintained it there, keeping up quality and standard under every circumstance.

DEAN'S PATENT ARDENTER MUSTARD.

BEST IN THE WORLD.

Ardenter Mustard Pellets

— FOR —

Dyspepsia and Indigestion.

UNIVERSALLY recommended and prescribed by physicians. The medicinal property are English mustard seed coated with pepsin and sugar. You will find it will relieve you after using two or three doses. It is very beneficial for Heartburn, Sour Stomach and Headache. They are a beautiful confection for children. Each bottle contains full directions.

W. G. DEAN & SON,

361 and 363 Washington Street, 84, 86 and 88
North Moore Street, New York.

COLDEN'S LIQUID BEEF TONIC.

AN INVALUABLE AID IN THE TREATMENT OF
ALL CASES OF DEBILITY.

Established 15 Years. Endorsed by Scores of Physicians.
Essentially Different from all other Beef Tonics.
Beware of Imitations.

COLDEN'S LIQUID BEEF TONIC consists of the Extract of Beef (by Baron Liebig's process), spirit rendered non-injurious to the most delicate stomach by extraction of Fusel Oil, soluble Citrate of Iron, Cinchona, Gentian and simple aromatics. An official analysis of this preparation by the eminent chemist ARTHUR HILL HASSALL, M. D., F. R. S., and an endorsement by SIR ERASMUS WILSON, F. R. S., is printed on the label of each bottle.

Its Range of Action Embraces all Cases of Debility.

By the urgent request of several eminent members of the medical profession, I have added to each wineglassful of this preparation two grains of SOLUBLE CITRATE OF IRON, and which is designated on the label as "No. 1," while the same preparation, without Iron, is designated on the label as "No. 2."

It acts directly on the sentient gastric nerves, stimulating the follicles to secretion and gives to weakened individuals that first pre-requisite to an improvement, an appetite.

I will, upon application, send a sample bottle of Colden's Liquid Beef Tonic to any physician in regular standing. Please ask your Dispensing Druggist (if he has not already a supply) to order it. In prescribing this preparation physicians should be particular to mention "COLDEN'S" viz: "EXT. CARNIS. FL. COMP. (COLDEN)." It is put up in pint bottles and can be had of Wholesale and Retail Druggists generally throughout the United States.

PURE FOOD AND THE FIFTIETH CONGRESS.

As we have already had occasion to inform our readers, there is no apparent likelihood that Congress will adopt any decisive measures during the present session in relation to the food adulteration question. This, however, is not because the subject has not been brought to the attention of that body. On the contrary, when the first session of the Fiftieth Congress began there was a great demand for legislation to prevent the sale of adulterated food. A number of bills with this object in view were introduced in both houses and a vast amount of testimony was taken by the Committee on Agriculture. The fact was made known to the House Committee that the trouble with American food products from the foreign standpoint was that at no time in their history are they subject to a disinterested inspection authorized by law, and with the power to expose and punish frauds: that so long as no check is imposed upon the American manufacturer or dealer other than the self-imposed one of interest

and reputation, just so long would it be impossible for this country to gain the hold on the foreign markets which the merits of its products would otherwise command. The House Committee on Agriculture reported two bills to remedy the evils complained of. One reported by Mr. Conger, on July 28, 1888, defined lard, imposed a tax of 2 mills a pound upon compound lard, and provided regulations for its manufacture, sale, importation and exportation similar to those contained in the Oleomargarine act. The Commissioner of Internal Revenue was charged with the execution of this act. The other bill, reported by Mr. Laird, of Nebraska, had a much wider scope, as indicated by its title: "A bill for the establishment of a pure food division in the Department of Agriculture, to provide for the inspection of live stock about to be slaughtered at the slaughter-houses, canning, salting, packing, and rendering establishments, the carcasses or products of which are intended for human consumption in any State or Territory other than where slaughtered, or for exportation to foreign countries, to prohibit the introduction of adulterated or misbranded food or drugs into any State or Territory or the District of Columbia from any other State or Territory or foreign country, and for other purposes." This bill provides for the inspection of live stock before slaughter, and of a microscopic post-mortem examination. It was made unlawful to transport from one State to another carcasses of live stock or food products not bearing a certificate of inspection. The introduction of any compound article of food or compounded drug from one State into another is prohibited unless accompanied by a label on which are stated the names of the ingredients of such article or drug. Provision is also made for a chemical analysis of any article of food or drug at the request of any citizen of the United States. At the commencement of the present session of Congress both these bills were ordered to be reprinted; but no steps have yet been taken looking to the consideration of either of them by the House. The fact that two bills have been reported to accomplish substantially the same result, one to be executed by the Commissioner of Internal Revenue and the other by the Commissioner of Agriculture, indicates unity of opinion as to the end, but a difference of opinion as to the means, which may prevent any action. However, it is hardly probable that there will be any legislation upon this subject at the present session. Even should one or both of these bills be passed by the House of Representatives, the Senate would not have time to consider them during the few remaining weeks of the session. All the work will, therefore, have to be done over again by the next Congress.

WHAT THE BUTCHERS SAY.

Our representative, whose interview with New York butchers not connected with the Chicago beef dressers is reported in another column, also elicited the following information: The wholesale price of Chicago beef in

New York is a little lower than of other beef because Chicago beef is sold for cash only; therefore this difference in price is due only to the usual rule of mercantile cash transactions. There is much more Chicago dressed beef used in New York than of all other beef whatever. This is due to the fact that Chicago sends a better grade of beef to this market, and the better grades of beef, as well as the higher-priced cuts, are more in demand. All the butchers seen by our representative, in addition to buying whole sides of beef, have constantly to buy prime cuts. Since the advent of Chicago dressed beef in the country, the grade and quality of all meat has improved. The public demands better beef, and, having found that the Chicago dressers can supply it, now insist upon it, are willing to pay for it, and local butchers are compelled to supply it. All, without exception, of the butchers seen say positively that they are perfectly willing to take the risk of the healthy quality of all meats sold by them upon the inspection of the dressed meat as they buy it, and that it would be impossible to foist any unhealthy beef, or meat from diseased cattle, upon their buyers. While they are heartily in favor of a United States interstate inspection, they are bitterly opposed to local inspection on the hoof, as it would deprive New York butchers of all New Jersey and Connecticut trade. Philadelphia butchers would lose the New Jersey trade, and Boston butchers would lose the trade from the adjoining States, which in the summer time is the bulk of their business. So it will be seen that the insane crusade against the Chicago beef dressers has led these self-styled advocates of the butchers to propose measures which would seriously injure the retailer without very much affecting the Chicago people, against whom the shaft is aimed. The old adage of biting one's nose off to spite his face is again verified.

THE TENNESSEE HEALTH BOARD.

The beneficent working of State Boards of Health is steadily becoming more generally appreciated by the public in whose behalf these organized efforts are exerted but there seems to be an almost universal reluctance on the part of State legislatures to appropriate funds for their support. Governor Taylor, of Tennessee, in his message to the General Assembly last month, made an earnest appeal on behalf of the Board of Health of that State, from which we quote the following:

"During the two years just ended those dreaded scourges of the human race, small-pox and yellow fever, have threatened the health and lives of the people of Tennessee, but through the prompt and wise action of the State Board of Health the one was successfully circumscribed in the several localities to which it had been imported, and the other was prevented a lodgment in the State, though it prevailed in a malignant and epidemic form just beyond our Southern border in a sister State. The importance of placing at the disposal of this Bureau a contingent fund is a recommendation which I desire to emphasize, as experience has time and again demonstrated that success in combating those epidemic diseases which in the past have swept over our State like terrific cyclones, leaving death and desolation in their tracks, and demoralizing and destroying commerce to a superlative degree, is attained

in proportion as such efforts are early, energetically, and intelligently made, and to enable the State Board of Health thus to act, such a fund should be provided for the purpose. I commend to you the several measures which, during your session, the State Board of Health may bring before you; especially would I ask your favorable consideration of the measure providing a system of registration of births, marriages, and deaths in Tennessee. All the more enlightened States and nations of the world possess such statistics, and find them as essential to good government. This is a long-felt want in Tennessee, and as we are fast becoming a very populous State, the necessity for such data is daily becoming more imperative. It became imperatively necessary during the late yellow fever epidemic, which approached our borders with such fearful menace, to use extraordinary quarantine precautions, and such danger not being foreseen and provided for by appropriation, I was forced, in order to protect the people, to order the sum of two thousands dollars placed at the disposal of the State Board of Health, and the success of their efforts was a gratifying demonstration of the wisdom of the act. The expenditure was made at the urgent request of the State Board of Health and by the concurrent advice of the Treasurer and Comptroller. I recommend that your honorable bodies ratify my action and make an appropriation, not only to cover the expenditure but to provide for future contingency, such appropriation to be held in reserve only for such dangerous and imminent necessity as that just experienced."

A PROTESTING VOICE.

In a general way, the question of "what's in a name?" is raised in a derisive spirit, the inference it carries being that character and quality are what are to be depended upon, irrespective of any specific designation for the article or the individual in interest. The question, however, assumes a serious aspect when, after an enterprise has been carried on to successful establishment, its characteristic title is deliberately appropriated by other parties as a designation for an entirely different scheme. Such an invasion of rights is complained of by a publisher in this city, who nine

BURNETT'S

years ago established a monthly journal devoted to vocal culture, to which he applied the very suitable title of *The Voice*, and who now finds himself compelled to change the name of his paper because of its having been appropriated by the publishers of a gratuitously circulated political organ, with high moral pretensions in behalf of the so-called prohibition party. As the musical quality of the voice is not best sustained by a dry throat, we take pleasure in calling the attention of our readers to the fact that the organ of voice culture is now known by the title of the *Voice Magazine*, leaving the pirated title to the unrestricted use of the organ of political disintegration.

THE MULTIPLICATION OF DRUGS.

A Baltimore physician in a paper published recently in a local medical journal denounces with lively earnestness the tendency to the multiplication of useless drugs. The writer asserts that in the index to the fifteenth edition of the United States Dispensatory, is a list of about seventeen thousand names of medicinal substances which, allowing for duplication and repetition, he estimates represents about eleven thousand remedies. Those of acknowledged merit in this enormous bulk are aptly compared to Gratiano's reasons, "two grains of wheat hid in two bushels of chaff." The very existence of this vast armory of therapeutic weapons demonstrates the doctor's weakness in his struggle with disease. The conquerors of this world are the men of few weapons; the needless elaboration of arms is the vain resort of the feeble.

OHIO INSISTS UPON GOOD BEEF.

The anti-dressed beef faction have scored a defeat to their credit in Ohio. On January 31st, the State Senate rejected by a conclusive vote the measure known as the Geyser Meat Inspection Bill, and that suicidal suggestion is not likely to be revived in the State. The bill provided for an inspection on foot within the limits of the State of all beef sold in the State—a scheme that would operate unfavorably in every way to the consumer, and also would be ruinous to the retail butcher. The retail dealers will gradually realize the absurdity of such restrictive measures, as well as the impracticability of securing their enactment into laws.

**THE superiority of these Extracts consists in their
PERFECT PURITY AND GREAT STRENGTH.**

There is no subject which should more engross attention than the purity of the preparations which are used in flavoring the various compounds prepared for the human stomach.

They are not only true to their names, but are prepared from fruits of the best quality, and so highly concentrated that a small quantity only need be used.

LACTOPEPTINE.

The most important remedial agent ever presented to the Profession for Dyspepsia, Vomiting in Pregnancy, Cholera Infantum, Constipation, and all Diseases arising from imperfect nutrition.

Lactopeptine precisely represents in composition the natural digestive juices of the Stomach, Pancreas and Salivary Glands, and will, therefore, readily dissolve all foods necessary to the recuperation of the human organism.

CAUTION

We regret that we are compelled to caution the profession in prescribing Lactopeptine, but very careful investigation has proven to us clearly the necessity of it. Substitution of cheap and worthless compounds are being made in many cases where Lactopeptine is prescribed.

Lactopeptine is always UNIFORM, and its effects are SPECIFIC, and no one has ever been able to imitate its digestive value. If you do not obtain positive results when you prescribe Lactopeptine, you can be sure that some substitution has been made, and in such cases it may be necessary for the physician to prescribe Lactopeptine in the original ounce package to insure certainty of obtaining the genuine article. We can confidently make this assertion, knowing the scrupulous uniformity in digestive value of every ounce of Lactopeptine.

Lactopeptine has always been kept strictly in the hands of the Medical Profession, never having been admitted in any publications but Medical Journals. It is prescribed by the most intelligent and educated physicians in all parts of the world, and there are but few physicians who have ever used Lactopeptine that will not agree with the late Prof. L. P. Vandell, when he says: "Lactopeptine is one of the certainties in medicine, and in this respect ranks with Quinine."

In the various forms of Dyspepsia, in vomiting in Pregnancy, and in Mal-nutrition of children, there is no known remedy so positive in results.

PIGMENTS.

THE SOURCES FROM WHICH PAINTERS' COLORS ARE DERIVED.

The following embodies some interesting information regarding the sources from which the colors one finds in a paint-box are derived. Every quarter of the globe is ransacked for the material—animal, vegetable and mineral—employed in their manufacture:

From the cochineal insects are obtained the gorgeous carmine, as well as the crimson, scarlet, carmine and purple lakes.

Sepia is the inky fluid discharged by the cuttle fish to render the water opaque for its concealment when attacked.

Indian yellow is from the camel.

Ivory black and bone black are made out of ivory chips.

The exquisite Prussian blue is got by fusing horses' hoofs and other refuse animal matter with impure potassium carbonate. It was discovered by an accident.

In the vegetable kingdom are included the lakes, derived from roots, barks and gums.

Blue-black is from charcoal of the vine stalk.

Lampblack is soot from certain resinous substances.

From the madder plant, which grows in Hindostan, is manufactured Turkey red.

Gamboge comes from the yellow sap of a tree, which the natives of Siam catch in cocoanut shells.

Raw sienna is the natural earth from the neighborhood of Sienna, Italy.

Raw umber is an earth from Umbria, and is also burned.

To these vegetable pigments may probably be added India ink, which is said to be made from burnt camphor. The Chinese, who alone produce it, will not reveal the secret of its composition.

Mastic—the base of the varnish so called—is from the gum of the mastic tree, indigenous to the Grecian archipelago.

Bistree is the soot of wood ashes.

Of real ultramarine but little is found in the market. It is obtained from the precious lapis lazuli, and commands a fabulous price.

Chinese white is zinc, scarlet is iodine of mercury, and cinnabar, or native vermilion, is from quicksilver ore.—*Iowa State Register.*

HORSE MEAT.—In Manchester, England, there are a hundred places where horse meat is sold, and it is eagerly purchased by the poorer classes, it being 10 or 11 cents per pound, while beef is 25 cents.

WHAT BEEF COSTS.

THE "AMERICAN ANALYST'S" STATEMENTS FULLY CONFIRMED BY THE BUTCHERS.

The alleged organs of the butchers have asserted that the table showing the actual retail prices at which meat is sold, as published in the *AMERICAN ANALYST*, January 10th, 24th and 31st, was a misrepresentation and inspired by interested motives. As these sheets confined themselves to assertions merely, we did not deem the matter deserving of notice, and as we felt that the only journal which really represented the respectable butchers was, in its efforts on behalf of the consumer, the *AMERICAN ANALYST*, we were content to let our figures remain, especially as the large demand for the numbers containing that table convinced us that our labors for truth and right were appreciated by the very interest which these sheets, who attacked us, falsely claimed to represent. Since then, however, our esteemed cotemporary, the *Burlington Hawkeye*, has been misled into an attack upon our statements, and we feel in duty bound to show to that journal that it is in error, assured that it will hasten to correct its position. The *Hawkeye* says that our article was inspired by the Chicago beef-dressers. As the *AMERICAN ANALYST* is nobody's organ, but is edited and managed entirely in the interest of those on whom it depends for its support, and those are the subscribers to the paper, among whom are more retail and wholesale butchers than any other journal has, whether called a butcher's organ or not, this assertion falls to the ground. Again, we are charged with grossly exaggerating the profits of the retailers. We said nothing about net profits. We only gave the facts and figures as we found them in New York, after careful enquiry had been made. We took no account of the expense of conducting a retail butcher's store, and only compared wholesale with retail prices of meat as found in the New York market. We did not claim that these prices applied to Burlington, Iowa, or any other point outside of the metropolis, and we presume that the *Hawkeye's* retail prices are correct, and when compared with wholesale prices at Burlington will be found to bear the same relative proportion as at New York. So after all our mathematics are admittedly correct. The *Hawkeye* finally gives it as its opinion that an interest of the magnitude of the beef trade should not be centralized at Chicago—but that has nothing to do with the question

of prices, being merely a question of geographical and commercial jealousy. On the subject of prices, however, wishing to reassure ourselves, we sent a representative of the *AMERICAN ANALYST* to inquire of the butchers who were in no way connected with the Chicago meat dressers as to the correctness of the quotations given by us. Such firms as William Ottmann & Co., and J. P. Disbrow's Sons, of Fulton Market; Beinecke & Co., of 196 Fulton street, Solomon Sayles, of Sixth avenue, and several others were seen on the subject, and the information obtained proved conclusively that the retail prices as given by us were correct.

To show this better, we will here recapitulate the retail prices as found by our representative, and also the wholesale prices of different parts of a carcass. The wholesale prices are as follows:

Loin, including kidney.....	10 cts.
Round, " flank.....	6 "
Chuck, " shank and neck.....	4½ "
Plate.....	4 "
Rib.....	10 "

which would give for the whole carcass:

159 pounds loin,	
34 " kidney,	
74 " rib,	
267 pounds at 10c.....	\$26.70
154 " round,	
18 " flank,	
172 " at 6c.....	10.32
138 " chuck,	
46 " shank,	
7 " neck,	
191 " at 4½c.....	8.59
120 " plate at 4c.....	4.80

Or a total of.....\$50.41

which is \$2.09 less than the wholesale prices given in our previous table; but this is principally due to a slight falling off in price just at this time.

As to the retail prices, the retail list of Messrs. William Ottmann & Co., now before us, shows the following prices as compared with those we printed before. Where Messrs. Ottmann's prices are not given, it is because they do not publish quotations on the poorer grades of meat.

THE COST OF BEEF.						
One Steer, weight 750 lbs.—Cut as below.						
PRODUCT.	LBS.	CUT PRODUCT.	LBS.	PRICE PER LB.	AMOUNT.	OTTMANN'S PRICES PER LB.
				Cents.		Cents.
Loins.....	159	Porterhouse Steak.....	55	23½	\$12.93	26
		Sirloin Steak.....	85	21	17.85	20
		Suet.....	19	4	76	..
		Round Steak.....	74	17	12.58	20
2 Rounds.....	154	Boiling Piece.....	16	7	1.12	..
		Roast Rump.....	39	15	5.85	15
		Soup Shank.....	25	5	1.25	..
2 Chucks.....	138	Shoulder Steak.....	74	11	8.14	..
		Boiling Pieces.....	64	7	4.48	..
2 Ribs.....	74	Roasts.....	74	19	14.06	20
2 Plates.....	120	For Salting.....	120	7	8.40	10
2 Shanks.....	46	Boiling Pieces.....	21	7	1.47	..
		Soup Bones.....	25	5	1.25	..
2 Flanks.....	18	For Salting.....	13	7	91	..
2 Kidneys.....	34	Flank Steak.....	5	11	55	..
2 Necks.....	7	Kidneys and Suet.....	31	4	1.24	..
		Necks and Bones.....	7	4	28	..
		Shrinkage in Cutting.....	3	..		..
Total.....	750 lbs.		750 lbs.		\$93.12	

The aggregate shows that we had actually understated the retail price of a carcass of beef by \$7.08. So much for the truth and reliability of our statements. We desire only to confess ourselves to the truth and this always prevails.

HYGIENE AND HYSTERICIS.

DOES SOLICITUDE FOR HEALTH INDUCE NERVOUS OVER-ANXIETY.

There is some discussion of the question: Does the great attention paid to health in these days produce an anxiety about bodily ailments which is a disease in itself? The question at first glance may seem an absurd one, yet, looking upon one side of the proposition, some cases can be presented which, standing alone, might indicate that too great a regard for health had a tendency to encourage or aggravate hypochondriasis. We have always had the hysterical and always will, but it should not be assumed that a reasonable attention to health should stimulate the growth of morbid fancies. With our State departments of health and local boards these matters are placed under intelligent direction, and extravagant notions and intemperate care are not so extensively indulged as formerly. There is a general diffusion of hygienic knowledge proceeding from professional sources which tends rather to decrease the number of neurotic and hysterical than to multiply them. There are no statistics bearing directly on the subject, but those furnished from the health departments show that the promotion of physical well-being is the result of the increased attention to health now prevailing. It will be further observed that the knowledge emanating from our boards of health is sanitary, and must not be confounded with the popular sanatory literature often disseminated to the injury of physical welfare, from which results the prevalence of self-drugging and fancied ills that seemingly afflict humanity. Besides all this, high medical authorities concur in the opinion that there is a general improvement in the public health.—*Sanitary News*.

DUST, DANCES AND DISEASE.

A WORD OF CAUTION REGARDING BALLROOM ATMOSPHERE.

In this festive season dangers are encountered with a light heart. Words of prudent caution are apt to be regarded as indications of senility which can be laughed to scorn by the more youthful and robust. The dangers of sudden chills when heated are rashly braved by those who have not learned wisdom from sad experience, until too many families have to mourn the loss of one whose initial troubles they date back to "exposure on leaving a dance." A correspondent seasonably draws our attention to another risk which cannot be avoided by the most prudent until it has been generally recognized, viz., the probably deleterious action of the irritant particles of glass flux, known in commerce as "glittering frost," "frost powder," etc. These particles were formerly affixed to artificial flowers and fancy dresses by some adhesive material, but they are now employed extensively by merely being dusted on before attending places of amusement, and are hence readily shaken off and diffused through the atmosphere by any brisk movements. Our correspondent has experienced irritation of the throat, while he has known other persons who were affected in the eyes, or who suffered from irritation of the skin of the face and hands, doubtless to be traced to this cause. It is quite conceivable that the trouble may extend further. It is well known that operatives working in an atmosphere charged with irritant spicules suffer from various forms of chronic pulmonary disease. In his admirable report upon the mortality in England and Wales during the ten years 1871-80, Dr. William Ogle devoted considerable space to the consideration of the mortality from phthisis and diseases of the respiratory organs in what he terms "dust-inhaling occupations." His figures bear a heavy record against the dust of stone and the dust of metal. Hitherto the dust of glass has escaped observation; indeed, the circumstances under which it is likely to be inhaled render it probable that subsequent bronchial affections are more likely to be attributed to some other cause; still it can scarcely be supposed that these insoluble sharp particles can be inhaled with impunity.—*London Lancet*.

COLOR CONTRASTS.

A SHORT ART LESSON FROM NATURE'S SCHOOL.

Nature is very sparing of showy contrasts of warm and cold colors. Red and blue are very rare, and of yellow and blue the cases are but few, and black and blue are found in lepidoptera more often than white and blue are seen in our flora or fauna. It is not uncommon for one of two strong colors to be overcast with a tinge of its fellow, or for both of them to be reconciled by a common touch of black or of some third color, or for one of them to be lightened by a dash of white, while the other is lowered by as much black, and so red, off-hued with black—russet and green upbrightened with white—often meet in the autumn in dead and dying patches of fading leaves. It may be shown, I believe, by the refractions of light in crystallized gypsum that brown is the complementary color to lavender-gray; and how true to herself is nature we may go forth and see, in the fall of year, in the dead and curled leaves of the mugwort, or meadow sweet, which are beautiful even in their death, with one side brown and the other the brown-matching gray; and, if brambles be cut in the leaf-green season, their two surfaces soon wither into the harmony of gray and brown. And what use are we to make of these hues of nature? They are warrants for a gray mantle, under locks of brown hair, or a brown bonnet of trimmings, or a gray room wall with brown furniture; and if, in a hot summer's day, I see the dark leaf-shades playing on the gray bark of a young beech, I can boldly lay darkish leaf-shades on a wall of the beech bark's hue; or if, after the winter rains, I find a barkless pole in railings, tinted with the palest blue-gray, and on breaking off a splinter of it I find its inner wood of its true color of pale brown-yellow, why should I not take the inner tint for my wall and the outer one for the skirting? Or, if I pick up a piece of lichen of dull green on one side and dull gray on the other, why should I not bind my book in one color and lay on it a lettering piece of the other? Nature is the best school of art, and of schools of art among men those are best that are nature's best interpreters.

OLIVE OIL IMITATIONS.

A BILL IN THE NEW YORK LEGISLATURE TO PREVENT THEM.

The following act to "prohibit deception in the manufacture, importation or sale of oil" was introduced in the State Senate on Jan. 14th.

Section 1. Whoever, by himself or by his agents, manufactures, imports, sells, exposes for sale, or has in his possession with intent to sell, any oil substance or compound made in imitation or semblance of olive oil, or as a substitute for olive oil, and not exclusively and wholly pure olive oil, or containing any fats, oils or grease or other foreign substance, unless the words "imitation olive oil," or "adulterated olive oil," are stamped, labeled or marked in printed letters of plain roman type, not less than one inch in length, so that said words can not be easily defaced, upon the top and side of every cask, can, bottle, package or other receptacle containing said article, substance or compound.

Sec. 2. Whoever, by himself or by his agents, violate the provisions of this act, in whole or in part, shall be guilty of a misdemeanor, and shall be punished for each and every separate offense by a fine of not less than one hundred dollars nor more than one thousand dollars, or by imprisonment in the county jail of the county wherein said person or persons shall be tried, for not less than one month nor more than one year, or by both, such fine and imprisonment in the discretion of the court pronouncing the sentence, one half of which fine shall be paid to the person or persons furnishing the evidence of the violation of the provisions of this act, and the residue shall be applied to the public school fund of the said county.

Sec. 3. Courts of general sessions of the peace shall have jurisdiction of all cases arising under this act, and their jurisdiction is hereby extended so as to enable them to enforce the penalty hereby imposed.

Sec. 4. This act shall take effect immediately.

MINERAL WAX.

DISCOVERY OF A VALUABLE MINE OF OZOKERITE IN UTAH.

Ozokerite, or ozocerite, is a mineral wax not found hitherto in any considerable quantities except in Moldavia, and in Galicia, Austria. Two or three years ago, however, Mr. J. Wallace, of New York, after long search, discovered a mine of the wax in paying quantities in Utah, on the line of the Denver and Rio Grande Railroad, 114 miles east of Salt Lake City. About 150 acres of the mine have been exploited thus far, and in January, 1888, the production of ozokerite in paying quantities from this mine began, and it is expected that the production will soon amount to 1,500 tons per year. The consumption in this country of ozokerite, and its by-products, for all purposes to which it has been thus far applied, has amounted to about 500 tons per year. Its main uses have been for the adulteration of beeswax and in the construction of wax figures; it is used in connection with paraffine in the manufacture of the best grades of candles; it is employed very largely also in the manufacture of wax paper, its value for this purpose arising from the fact of its resistance to all materials containing acids; a great part of the body and polish in many kinds of shoe blacking are the result of a liberal use of ozokerite in its manufacture. But the chief use to which this wax seems to be destined is as a waterproof insulator for magnetic wires. The experiments thus far made have seemed to show that for this purpose ozokerite is preferable, all things considered, to any other substance hitherto employed. It is now in use extensively by eight of the electrical companies of this country, and if it can be produced as cheaply and in as large quantities as Mr. Wallace now anticipates, its use as an insulator is probably destined to very great extension at no distant day.

INDIA-RUBBER PAVEMENTS.

WOULD NOT THEIR NOISELESSNESS BE A NEW SOURCE OF DANGER?

The authorities of the city of Basle, says the *India-rubber Journal*, intend repaving their principal thoroughfares, and are now considering the material best suited for the purpose. In one street a trial was given to wood pavement, but somehow it does not give satisfaction. The decision, therefore, turns upon asphalt or india-rubber. The latter was invented by the German engineer, Busse, in Linden, near Hanover, and was first practically used about fifteen months ago for paving the roadway over the Goethe Bridge, in Hanover, which required about one thousand square metres of material. This first experiment proved so successful that during the present year another street in Hanover was paved with india-rubber, to the extent of fifteen hundred square metres. Berlin is already considering the advisability of availing itself of the same pavement, and has given it a fair trial by laying it down over a considerable distance near the Lutzow Bank, which example is being followed by Hamburg. The india-rubber pavement is said to combine great elasticity with the hardness of stone, to be completely noiseless, and to suffer neither from cold nor hot weather. Moreover, it is not slippery, like asphalt, and is more durable.

Subscriptions \$1 per year. Now is the time to subscribe.

DOMESTIC DIETETICS.

SPECIALLY PREPARED, FROM PRACTICAL TESTS, FOR THE
LADY READERS OF THE "AMERICAN ANALYST."

SEASONABLE FOOD.

February.

MEATS.—Beef, mutton, ham, kidneys, liver, venison, sausage, pork.

GAME AND POULTRY.—Grouse, hare, pigeon, chicken, duck, turkey, goose.

FISH.—Bass, cod, crabs, eels, carp, catfish, flounder, halibut, herring, lobster, mackerel, mussels, oysters, perch, pike, rock-fish, salmon, smelt, whitefish.

VEGETABLES.—Artichokes, beets, beans, cabbage, carrots, celery, garlic, lettuce, onions, parsley, parsnips, potatoes, shallots, spinach, tomatoes, turnips.

FRUIT.—Apples, bananas, grapes, oranges.

PRACTICAL RECIPES.

QUICK BEEF SOUP.—One-half onion, three or four stalks of celery, one sliced carrot, salt, pepper, mace, two tablespoons Liebig's extract of beef, 2 quarts water. Boil vegetables and seasonings in the water for half an hour, strain and add the extract. Stir well and serve.

TURBOT PIE.—Take the remains of cold turbot, free the white flesh from skin and bone, tear it into flakes and season with pepper, salt and powdered mace. Spread it at the bottom of a thickly-buttered baking dish, and pour over it any appropriate sauce, or melted butter, cover with a thick layer of potato paste, bake, and salamander.

ZEST FOR GRAVIES.—Powdered thyme, sage, cayenne pepper, pimento, black pepper, coriander seeds, and mace, in fine powder equal parts. Thoroughly mix these. There is also a zest compound of the peels of oranges, lemons, or citrons cut from the top to the bottom in small slips as thin as possible. Any ingredients possessing penetrating and pungent qualities form zests.

RISSOLES.—Boil and mash any kind of vegetables together, add mashed potatoes, bread crumbs and any seasoning desired, then bind with an egg. Shape, and dip in egg and bread crumbs, and fry till the rissoles are light brown in color.

SWEET BREAD SALAD.—Boil the sweetbreads till tender, throw them into cold water for a few moments. Dry them, cut them into small pieces. Have ready some crisp celery, about as much as the sweetbreads, cut into small pieces. Add this to the sweetbread, and over all your mayonnaise dressing, flavored slightly with a dash of onion.

PEARL CAKE.—Whites of three eggs, one teacup of white sugar, one teacup of flour, one teacup of corn flour, half a teacup of butter, half a teacup of milk, two spoonfuls of Horsford's baking powder; flavor with lemon. Beat the butter to a cream, add the sugar and other ingredients, and lastly the eggs (whites only), well beaten. Bake at once in a moderate oven.

AN EXCELLENT CAKE.—One pound of flour, one pound of butter, one and a quarter pounds of flour, ten eggs, one-half gill of sherry wine, one-half gill of rose water, one grated nutmeg, one teaspoon of mixed ground cinnamon and cloves. Beat the butter and sugar to a very light cream, then add the wine and rose water. Whisk the eggs until thick, add and beat them into the butter and sugar by degrees; then add and stir in the flour gradually, and then the spices. Beat all well together for ten minutes, and bake in square pans lined with buttered paper, and in a moderate oven. When done sieve powdered sugar over the top.

AMERICA.

DID VESPUCCIUS RECEIVE OR CONFER THE NAME OF THE
WESTERN WORLD?

Amerigo Vespucci, the Florentine navigator, has usually been credited with conferring his name upon the Western World—a circumstance which has caused no end of regret to many historians, who argue that it should have been called Columbia in honor of the illustrious discoverer. The researches of the author, Thomas de St. Bris, in his "Discovery of the Origin of the Name of America," seem to show that the name America was derived from the native name of Central America and the northern portions of South America, which, it is well known, were among the very first localities visited and colonized by the Spaniards. The name was variously written by early navigators, who adapted what seemed to each the nearest imitation of the native word. Thus we have an Ama-America. To this was frequently added the race, Ameroco, Maraca, Moraca, and finally native word "pana," which, according to Sir Walter Raleigh, is the equivalent of country. It seems strange that these facts should have remained so long in obscurity, although it is perhaps not less remarkable than that the Norse discoveries during the tenth century should only recently begin to attract attention. These names actually occur on the maps and charts of the Spaniards, and the author has given a reproduction of one of them, showing the geographical knowledge available during the early part of the fifteenth century. On the whole, this pamphlet, the substance of which was given by the author before the American Geographical Society, contains considerable interesting information relating to the earlier history of the Americans.

CIGARETTE RESTRICTIONS.

A BILL FOR THE BENEFIT OF YOUTH.

A bill was introduced in the New York Senate last week which commends itself strongly to the good sense of the community, on behalf of the welfare of the rising generation. It provides that no person under fifteen years of age shall smoke a cigarette or a cigar in any street or other public place in this State under a penalty of ten dollars for each offence. Such a bill ought to be rapidly expedited in its progress, and be very vigorously enforced when it becomes a law, as we hope it will become.

STEEL PENS.

THE PROCESS OF THEIR MANUFACTURE.

About a million gross of steel pens are worn out every year in the United States. What becomes of them? Twenty years ago most of the steel pens used in the country were imported. Now comparatively few are imported, and there are several factories in this country in which they are made in large quantities. One factory is in Connecticut, another in Pennsylvania, and a large one in Camden, N. J. The manufacturers say that the industry has been fostered by the protective tariff, and were it to be taken off, the country would be flooded with cheap steel pens of inferior quality at lower prices than ours. At present the importation of foreign pens is mainly confined to high priced articles. It was at first doubted that steel pens could be made in this country, but it was soon learned that the requisite skilled labor could be obtained for high wages, and the success of the pioneers led one manufacturer after another into the business, until now the field is pretty well occupied. Most of the work on the pens is done with the aid of very nice machinery worked by women and girls. The steel used is imported, because it is believed that the quality is more uniform than the American

steel. This uniformity of quality is necessary, because of the very delicate tempering required in the manufacture of the pens. That mysterious quality of steel which gives different colors requires expert manipulation on the part of the workman who does the tempering. He must know the nature of the material with which he works, and with that knowledge must exercise celerity and skill which seizes upon the proper instant to fasten the steel at a heat which insures the requisite quality. First, the steel is rolled into big sheets. This is cut into strips about three inches wide. These strips are annealed—that is, they are heated to a red heat and permitted to cool gradually so that the brittleness is all removed and the steel is soft enough to be worked easily. Then the strips are again rolled to the required thickness, or rather, run. It is the quick eye for color and the quick hand to fasten it that constitutes the skill to determine the temper of steel. When the steel is heated for tempering it is bright. The first color that appears is a straw color. This changes rapidly to a blue. The elasticity of the metal varies with the color, and is arrested at any point by instant plunging in cold water. The process of slitting, polishing, pointing and finishing the pens are operations requiring dexterity, but by long practice the workmen become very expert. There have been but few changes of late years, and the process of manufacture is much the same as it was twenty years ago, and the prices are rather uniform, ranging from 25c. to \$4 per gross, according to the quality of finish. The boxes sold almost universally contain a gross.

EDIBLE BIRDS' NESTS.—J. B. Steere, in the *American Naturalist*, adds considerable to our knowledge of edible birds' nests—regarded as a rare delicacy in Chinese cookery—though he still evidently sticks to the old notion that the gelatine of which the nests are in part or wholly made is a fluid secreted from the salivary glands of the swifts that make the nests, which liquid hardens on exposure to the air. As far as our own chimney swifts are concerned, it has been proved that the gum with which the twigs are fastened together is of a vegetable and not of an animal character, and that in the case brought to the notice of the Academy of Natural Sciences of Philadelphia, where the matter was investigated, the gum was found to belong to the cherry tree. In the case of edible birds' nests, the "gum" has been proved to be a seaweed, brought by the bird, often from long distances.

NEW THEORY.—The theory is held by Professor Mendeleef that petroleum is produced by water, which penetrates the earth's crust and comes in contact with glowing carbides of metal, especially those of iron. The water is decomposed into its constituent gases, the oxygen uniting with iron, while the hydrogen takes up the carbon, and ascends to a higher region, where part of it is condensed into mineral oil, and part remains as natural gas, to escape wherever and whenever it can find an outlet. If this assumption is correct, and a sufficient store of metallic carbides is contained in the earth's interior, petroleum may continue to be formed almost indefinitely, and yield a supply of fuel long after coal is exhausted. Professor Mendeleef supports his views by producing artificial petroleum in a manner similar to that by which he believes the natural product is made.

UTILIZATION OF REFUSE.—Dr. Lawson, the Curator of the Nilgri Gardens, has been making some experiments on the applicability of refuse cocoanut fibre to the automatic closing of shot holes, following in general the plan indicated by M. de la Barriere in the *Revue des Deux Mondes*, in 1886. A quantity of the powdered refuse is taken before it is quite dry, and subjected to a heavy pressure under which it forms a sort of brittle millboard. In his experiments Dr. Lawson took a plate of this substance eighteen inches square and three-fourths of an inch thick, and, using it as one side of a water-tight box, fired three shots with a bullet one inch in diameter through it without a single drop of water issuing through the bullet holes, the material closing up automatically behind the bullet. In another case a bullet one inch in diameter was fired through. This was at first followed by a strong jet of water, but in a few seconds the flow diminished in volume, and in the course of one minute had completely stopped.

WOOL A PREVENTIVE OF SORE THROATS.—According to Mr. H. V. Knaggs (*Archives of Pediatrics*), a few threads of Berlin wool placed around the neck and worn continuously are an efficient preventive against these uncommoding complaints, which many persons are so prone to catch on exposure to cold. From ten to twenty threads are enough for the purpose. They should only be removed for making ablutions, and should be left off gradually by discarding daily one thread at a time. The remedy probably acts by keeping up a belt of skin action, thus acting mildly and continuously as a slight counter-irritant.

ANCIENT TIMBER.—Probably the oldest timber in the world, which has been subjected to the use of man, is that found in the ancient temple of Egypt, in connection with stonework, which is known to be at least four thousand years old. This, the only wood used in the construction of the temple, is in the form of ties, holding the end of one stone to another. When two blocks were laid in place an excavation about an inch deep was made in each block, in which a tieshaped like an hourglass was driven. It is, therefore, very difficult to force any stone from its position. The ties appear to have been of the timarisk or Shittim wood, of which the ark was constructed.

SPONTANEOUS COMBUSTION.—Electric heat indicators consisting of thermometers incased and protected by iron tubes, provided with platinum wires and connected to a system of electric bells and indicators on deck, are the latest invention for preventing spontaneous combustion among ship cargoes. Should any undue heat arise in any part of the cargo, the mercury in the thermometers will rise, make contact with the platinum wire, and give an instantaneous alarm on deck, indicating at the same time the exact spot where the heat exists.

A NEW PREVENTION.—An electrician has invented a material which he calls alterion, for the prevention of corrosion in boilers. The interior is coated with this, and currents of electricity are passed through the boiler, and from time to time reversed. The formation of the scale is prevented by a layer of hydrogen gas, which is deposited upon the inner surface of the boiler. The reversed currents reform the hydrogen into pure water, a thin layer of pure water being thus kept all around the boiler.

DR. AYER'S PREPARATIONS.

Pharmaceutical preparations of all kinds should be judged by the character and reputation of the manufacturer who makes them. Every purchaser ought to have a positive assurance that he obtain just what he pays for and that if he buys such a preparation he has the right to demand a guaranty that the article delivered to him is of the precise quality, quantity, and strength which he has been led to believe it to be. Among pharmaceutical preparations, we include all standard medicines made from a known formula and offered either to the trade or public as a remedy for certain indicated disease. The good character and reputation of the manufacturers, as these words are generally understood, are not the only safeguards; but the purchaser, also, should know that they have the necessary technical, scientific, mechanical, and practical knowledge and experience to buy the required materials and compound them properly; that they have sufficient capital to buy these materials whenever an unusually good quality is offered, because drugs of good quality are not always in the market—and so to fit up their manufactory as to have the latest and most approved machinery, and also to be able to purchase in such large quantities as will invariably cause those having such materials to make them the first offer and give them the pick. Such manufacturers must also employ the very highest talent attainable to do the manual work in the preparation of their goods. In turn, these qualifications and facilities will enable them to do a very large business and thus the *pro rata* expense of many branches of the business will be lessened, which gives that much more to expend on making and maintaining the best quality only. We have thus set a very high standard for the manufacturer of such preparations and yet we can easily fill it. We refer now to the celebrated firm of J. C. Ayer & Co. of Lowell, Mass., a firm now established more than forty years; originally started by a man of large experience, it has been steadily carried on with the sole object of making only the very best. Having an enormous capital at its disposal, it is probably the

heaviest purchaser of sarsaparilla in the world, the kind used by the company being the Honduras root, which is the richest in medicinal properties.

All the medicines made by this house are worked up by skilled men, after the most approved methods. Each preparation is neatly bottled or boxed, labelled, cased and marked. A large demand existing for these goods the world over, the supply is constantly renewed, so that, in one word, whether you buy Ayer's Sarsaparilla, Ayer's Cherry Pectoral, Ayer's Pills, Ayer's Ague Cure, or Ayer's Hair Vigor the buyer is always sure of getting just what he has been led to expect from the advertisements of the house. These preparations are sold at retail cheaper than any druggist could compound them of the same quality, and are obtainable everywhere.

LIFE NO JOKE.—The man who amounts to anything in this world, and has no burdens to carry, is an exceedingly rare specimen. The goal is reached by the fellows who keep up good heart and never lie down under their load.

OLIVE SEED PEPPER.—The microscopist of the Department of Agriculture, Professor Thomas Taylor, has discovered that pepper is adulterated often as much as 50 per cent. with the seed or stone of the olive, which are obtained in large quantities from the olive oil factories.

BUSINESS NOTES.

A FINE OFFER.

The advertisement of the *Household Monthly* which appears in another column, is a very attractive one and tells its own story in a plain unvarnished way. When people can get so good a paper as this, together with a youth's paper, a manual of fancy work, and Webster's Handy Dictionary besides, all for a single dollar, the publishers ought to be inundated with demands of the great reading public. The *Household Monthly* is now in its seventh volume.

LOOK OUT for Imitations and Substitutes OF *Horsford's* ACID PHOSPHATE.

A variety of imitations and substitutes of this standard preparation have appeared under the name "Acid Phosphate," or a similar title, all of which differ materially from the genuine article.

Be sure the name "**HORSFORD'S**" is on the label. No other genuine.

SCOTT'S EMULSION

OF PURE COD LIVER OIL WITH

HYPOPHOSPHITES OF LIME AND SODA.

THE STANDARD EMULSION OF COD LIVER OIL THROUGHOUT THE WORLD.

A BEAUTIFUL CREAMY MIXTURE—ALMOST AS PALATABLE AS MILK.

Having much greater remedial power than the crude Cod Liver Oil, without any of its nauseating effects.

Its PALATABLENESS, EASE OF DIGESTION, and long tolerance by most sensitive stomachs as well as its reliable therapeutic effect, has given it special favor with the medical Profession, and receives their unqualified endorsement and support.

Possessing as it does the tonic and stimulating properties of the Hypophosphites in combination with the strengthening and fattening qualities of the Cod Liver Oil—gives it a remedial value in WASTING DISEASES, ANÆMIA or IMPOVERISHED BLOOD, EMACIATION and CONSUMPTION—unequalled by any single or combined remedy in existence. The rapidity with which delicate children fatten and grow strong on this palatable Emulsion, is very remarkable.

Samples will be sent free except express charges to any wishing to try this preparation. For sale by all druggists.

SCOTT & BOWNE, New York.

THE TORSION

Braided Wire Mattress.

At all times a thoroughly ventilated and perfectly clean mattress, it cannot absorb odors, or retain exhalations or disease germs.

D. HAYES AGNEW, M. D., Prof. of Surgery, University of Pennsylvania, says:

"The Torsion Braided Wire Pillow and Mattress I regard as superior to anything of the kind now in use; well suited for either private or hospital use."

Prof. WM. H. PANCOAST, late Professor of Anatomy, etc., in Jefferson Medical College, now Professor of Anatomy and Clinical Surgery in the Medico-Chirurgical College of Philadelphia Hospital Surgeons, says:

"I have used in my surgical practice your Braided Wire, in the form of mattresses, pillows for the head and body, and short pillows for the arm and leg when injured. I find them most admirable, cool and light, yet affording perfect and elastic support."

I have saved a patient from bed sores by the use of the Braided Wire mattress."

WM. H. FORD, President Board of Health, Philadelphia, says:

"I have used the Torsion Braided Wire Mattress with great satisfaction, it is light and therefore easily handled; it is elastic and very comfortable. The case can be easily removed to afford a complete airing, a feature of great importance from a health point of view. It is an invention of great usefulness."

**"THE QUEEN OF
AMERICAN PAPERS."****THE
HOUSEHOLD
MONTHLY****MARCIA L. WATSON, Editor.**

Our Contributors are Douglas Frazer, E. Raum Boyle, M.D., Verend Minster, Mrs. Alice M. Crockett, Edwin Ruston, L. C. O. Houghton, Mrs. F. M. Howard, Eleanor W. F. Bates, Ada Thorpe Loftus, Harriet Tremaine Terry, Julie Adams Powell, and others.

DECORATIVE OIL PAINTING. by Mrs. ALICE M. CROCKETT, is worth many times the subscription price, to those interested in this.

FLORICULTURE.—Floral Talks, by EDWIN RUSTON, delight the amateur florist, and all who love flowers.

MEDICAL TALKS. by Dr. R. RAUM BOYLE, invaluable to all who will take good advice for the preservation of their health.

HOUSEHOLD HINTS is a collection of tried recipes each month. A series of articles "How to Entertain," "Five O'Clock Teas," "The Art of Housework," "Hints by the Way," etc., etc., are now running, by EUNICE, DOROTHY W., and ELEANOR W. F. BATES.

CHILDREN.—Charming illustrated juvenile stories and poems every issue.

CORRESPONDENCE.—A page of letters from the "Household Sisters" brightens every issue, and the EXCHANGE COLUMNS are always of interest.

STORIES.—Each issue contains one complete illustrated story, poems, etc.

The Actual average bona fide circulation of the H. M. in 1888 was 158,916 Copies per month.

HOUSEHOLD LEAVES.

A Manual of Knitting and Crocheting. Contains more practical articles than any other book. Each pattern has been tested by an expert and found to be correct.

PARTIAL CONTENTS:—Directions for making Baby's Boots, Hoods, Lady's Undervests, Baby's Sack, Quilts, Purses, Lamp Mats, Ties, Slippers, Toboggan Cap, Infant's Shirt, Shoulder Cape, Skirts, Scrap Bag, Afghans, Lady's Under Jacket, Child's Leggings and Drawers, Gentlemen's Gloves, Mitts, Baby's Blanket, and an almost endless variety of elegant patterns of Edgings, Insertions, etc. 64 large pages elegantly gotten up.

FANCY WORK.—This department is celebrated for its original designs, and reliable directions. The latest Parisian and London, as well as American novelties appear regularly. 8 to 10 correct illustrations add interest to this department.

FASHIONS.—The latest Fashions appear each month, with an average of twenty beautiful engravings. Our Fashion Department is not excelled by any American publication.

ART NEEDLEWORK.—A series of fine articles on "High Art Embroidery," by L. C. O. HOUGHTON, profusely illustrated, is a valuable feature.

SUNSHINE FOR YOUTH.

The best juvenile periodical on this continent. **Sunshine for Youth**, and for those of all ages whose hearts are not withered, is a 16 page, 64 column monthly publication. The best writers for youth in the world are its regular contributors. Every number splendidly illustrated. Subscription price, 75 cents per year.

The Prime Object of this advertisement is to place **THE HOUSEHOLD MONTHLY** in your home the coming year, if you don't know how good it is we want to hire you to try it. Seventh volume. See our great dollar offer below.

WEBSTER'S HANDY DICTIONARY.**"A Library in itself."**

Webster's is the acknowledged standard of the English Language. This edition supplies the orthography, pronunciation, meaning and etymology of all English words which are likely to be encountered by the general reader or student. It is copiously illustrated, contains also a chapter of Foreign Words and Phrases. It is of convenient size, not so cumbersome and bulky as the "Unabridged," just right for daily use.

This Dictionary must not be confounded with the cheap Dollar Dictionaries with which the country is flooded. This is **WEBSTER'S, THE STANDARD.**

OUR GREAT OFFERS

For 25 Cts. we will send *The Household Monthly* 6 MOS.; for 50 CTS. will send it 1 YR.

BUT as an EXTRA INDUCEMENT, for \$1.00

we will send *The Household Monthly* ONE YEAR, ONE COPY of *Webster's Dictionary*, ONE COPY of *Household Leaves*, and 1 YEAR'S subscription to *Sunshine for Youth*.

ALL FOUR POSTPAID. \$1.00 Covers the whole Combination. We want you to KNOW what *The Household Monthly* is by being a subscriber, and are willing to PAY YOU to subscribe.

Remit by registered letter, check or P. O. money order.

THE VIBURNUM COMPOUND

OF

DR. HAYDEN,

THE STANDARD IN

FEMALE DISORDERS.

Employed in the leading Hospitals, and prescribed daily by the most eminent Gynæcologists. **Five Thousand Physicians** have given their testimonials for **HAYDEN'S VIBURNUM COMPOUND**.

DISPENSED BY ALL APOTHECARIES.

OPIUM AND LIQUOR HABIT CURED.

WE solicit an investigation of our system and methods, and will gladly send to any one very interesting matter on the OPIUM HABIT DRUNKENNESS and their effects and cure. Physicians specially invited to examine, and if desirous of trying our remedies, liberal arrangements will be made with them.

THE LESLIE E. KEELEY CO., Dwight, Illinois.

is the most reliable substitute known for mother's milk. Its superiority rests on the test of 30 years use in Great Britain and the U. S. A. sustaining, strengthening diet for Invalids; nutritious, easily digested, and acceptable to the most delicate stomach. Four sizes, 35c. up. Pamphlet, "Healthful Hints," sent free. **WOOLRICH & CO.**, Palmer, Mass.

A NEW USE FOR LIQUID PEPTONOIDS.

Successfully used in Dissolving the False Membrane in Diphtheria.

A Physician writes: "In an experience of over thirty years I have never used anything to equal your **LIQUID PEPTONOIDS** as a local application with a spray. It will dissolve the membrane and destroy the diphtheretic odor in less than twenty-four hours. I use the **LIQUID PEPTONOIDS** full strength, as a spray, two or three times a day, in bad cases."

Used successfully by another physician in two desperate cases:—"I was induced to try **LIQUID PEPTONOIDS** in two very desperate cases of **DIPHTHERIA**. I think I never saw throats more heavily coated with exudate than were these, and I think I never saw it more rapidly disappear than in these cases, by frequent spraying with your **LIQUID PEPTONOIDS**."

LIQUID PEPTONOIDS can be taken by patients unable to ingest food in any other form. In *dyspepsia* and *loss of appetite* its effects are positive, its digestive properties assisting in the digestion of food taken and its peptogenic properties quickly stimulating the natural digestive secretions of the stomach.

PANCROBILIN.

Prepared (in both Liquid and Pill form) from Extract of Pancreas and Bile.

This preparation is designed expressly to increase the digestion and absorption of fats.

We believe that the fat-digesting properties of pancreatic and bile are inseparable, and that without their union in the intestinal tract but little, if any, fat would be digested and absorbed.

PANCROBILIN will be found of great service in *Phthisis* and other wasting diseases, *Nervous Prostration*, *Constipation*, *Inanition*, *Malnutrition*, *Intestinal Indigestion* and wherever there is a failure to assimilate fats.

If the skin is first wet with **LIQUID PANCROBILIN**, the inunction of oils will be greatly facilitated.

LIQUID PANCROBILIN is put up in pound bottles. **PILL PANCROBILIN** is put up in bottles holding 100 pills. The coating of the pills will resist acid digestion, when given as directed, but will be quickly dissolved in the alkaline secretions of the duodenum.

PHOSPHO-CAFFEIN COMP.

(Granular Effervescent.)

Formula for each dessertspoonful:—

Caffein.

Acidi Phosphorici aa, grains, ss.

Antipyrin.

Ext. Apii. Grav. dulc. (Celery), aa grains, j.

Sodium Bromide, grains, v.

The satisfactory results produced by **PHOSPHO-CAFFEIN COMP.** in *Headaches*, *Neuralgia*, *Insomnia*, *Neurasthenia* and general *Nervous Irritability*, are not due to the effect of any one ingredient, but to the happy effect of the combination. A thorough series of comparative tests have demonstrated the superiority of the above formula over any other in the market.

REED & CARNRICK, New York.

Tabasco Pepper Sauce

OR LIQUID PEPPER.

Is simply the Pulp of the Ripe Pepper Extracted by Pressure.

The seed of this Pepper was obtained from Central America, and by careful cultivation in Louisiana for many years has been so improved in strength, flavor and aroma, as to have become a new variety of Red Pepper, superior to all others. The pulp is so handled as to retain all the flavor, strength, aroma and color of the ripe fruit, and to keep unimpaired in any climate. It excites the appetite, promotes digestion, and is pronounced, by connoisseurs, to be the finest condiment in the world. For medicinal purposes it recommends itself by its purity, strength and diffusible form.

Manufactured by **E. McILHENNY,**
NEW IBERIA, LA.

For Sale by all Wholesale Grocers.

NATRONA BI-CARBONATE OF SODA.

(ABSOLUTELY PURE.)

The nature of the raw material from which NATRONA BI-CARBONATE OF SODA is made—viz., kryolith, a mineral containing pure sodium—insures a purity and uniformity of product which cannot be obtained from any other known material. In making Bi-CARB. SODA from any other raw material, the use of sulphuric acid is a necessity, but none is used in any part of the process of making NATRONA BI-CARB.; hence its entire freedom from the slightest trace of arsenic, which is always present in ordinary soda. Its absolute purity and entire freedom from all traces of sulphate of soda, common salt and other impurities, render NATRONA BI-CARB. NEARLY TASTELESS, and being bolted through the finest bolting-cloth, insures the finest stage of division.

To these indisputable facts the attention of CONSUMERS of soda is specially called. They are IMPORTANT, and should influence both those who use and those who sell soda, to buy and sell NONE BUT THE BEST.

The NATRONA BI-CARB. Soda is kept in stock by almost every wholesale druggist and grocer throughout the United States, of whom it may be ordered.

Natrona Bi-Carb. Soda is unequalled by any other brand of English or American Manufacture.

COLDEN'S LIQUID BEEF TONIC.

AN INVALUABLE AID IN THE TREATMENT OF
ALL CASES OF DEBILITY.

Established 15 Years. Endorsed by Scores of Physicians.
Essentially Different from all other Beef Tonics.
Beware of Imitations.

COLDEN'S LIQUID BEEF TONIC consists of the Extract of Beef (by Baron Liebig's process), spirit rendered non-injurious to the most delicate stomach by extraction of Fusel Oil, soluble Citrate of Iron, Cinchona, Gentian and simple aromatics. An official analysis of this preparation by the eminent chemist ARTHUR HILL HASSALL, M. D., F. R. S., and an endorsement by SIR ERASMUS WILSON, F. R. S., is printed on the label of each bottle.

Its Range of Action Embraces all Cases of Debility.

By the urgent request of several eminent members of the medical profession, I have added to each wineglassful of this preparation two grains of SOLUBLE CITRATE OF IRON, and which is designated on the label as "No. 1," while the same preparation, without Iron, is designated on the label as "No. 2." It acts directly on the sentient gastric nerves, stimulating the follicles to secretion and gives to weakened individuals that first pre-requisite to an improvement, an appetite.

I will, upon application, send a sample bottle of Colden's Liquid Beef Tonic to any physician in regular standing. Please ask your Dispensing Druggist (if he has not already a supply) to order it. In prescribing this preparation physicians should be particular to mention "COLDEN'S" viz: "EXT. CARNIS. FL. COM. (COLDEN)." It is put up in pint bottles and can be had of Wholesale and Retail Druggists generally throughout the United States.

ANTI-OLEO AGAIN.

The movement in opposition to oleomargarine is revived by a certain class of agitators with such apparent earnestness and at such regular intervals that suspicion is sometimes engendered as to its real honesty. It has been suggested, for instance, that the dairy interest find it expedient to go frantic every once in a while over the abomination, to them, of a cheap substitute in order to divert attention from the wretched quality of the product they themselves manufacture. However that may be, a better common sense seems to be gradually gaining ground in regard to the merits of the controversy, and there are hopeful indications that the iniquitous oleomargarine bill will, after a while, be repealed. It certainly seems monstrous that the manufacture of a cheap, wholesome, palatable product, indorsed favorably by all the leading chemists of the world, should be hampered by Federal restrictions to almost the point of absolute prohibition, in order to allow an exclusive privilege to the rancid, heterogenous, artificially-painted butter stuff which our farming population inflict upon the community. The poorer classes, who would be the gainers by the cheap, pure, artificial

article, are the helpless victims of the costly, impure, so-called natural article. Our attention has been called to the subject by an effort set on foot in this city about a fortnight ago to secure from Congress a large additional appropriation for the enforcement of the oleomargarine law. The Internal Revenue Department collects now a tax of \$800,000 from the oleomargarine manufacturers and dealers. The Deputy Dairy Commissioner of this State, who has made himself chiefly conspicuous by his unmeasured hostility to oleomargarine and his blind incapacity to detect the trickeries of the dairy men, now calls for an appropriation of \$500,000 in order to insure the collection of the \$800,000 tax. The proposition was indorsed by a handful of merchants, not all of whom were dealers in dairy products, and the general impression in the trade is that the scheme was devised in order to provide a shield for the Deputy Commissioner's own official shortcomings. The *Commercial Bulletin*, probably the best authority on the subject, regards it as a singular feature of the matter that the Federal officials are satisfied that the oleomargarine law is as well enforced as any of our revenue measures at present; that the interests of the Government are protected, and that if Mr. Van Valkenburgh's representations are correct the fault lies with himself and other State and local officers rather than with the Government service. It is also worthy of notice in this connection that while the Federal officials feel competent to enforce the oleomargarine act with a reasonable degree of efficiency, at less cost than five-eighths of the revenue collected, they express fears that the prevention of adulteration of butter and cheese is not equally effectual. This is a matter with which Mr. Van Valkenburgh's duties are more directly connected than with the enforcement of the Federal law. While the Government officials are enforcing the oleomargarine act without expending more than half the revenue in the employment of agents, the State Dairy Commissioner and his aids might give a little more attention to the investigation of the charge made by the Commissioner of Internal Revenue that nearly half as much oleo oil as is used in making oleomargarine is clandestinely used in the adulteration of dairy products.

BEEF INSPECTION.

In another part of this issue will be found an extended discussion of the beef inspection question, expressing the views of several Western live stock journals and boards of trade and other interests, whose opinions, based upon practical familiarity with the subject, will be generally conceded as of high authority. It is noteworthy that these opinions are unanimously and unequivocally adverse to the proposition of local State inspection. If the purpose of wise legislation is to further the advantage of the many, and not to discriminate for the special benefit of a few, it is difficult to see on what ground opposition can be based to the principle of national inspection. The effect of such a system would be to insure to the public a supply of sound, wholesome beef, every ounce of which would bear

the stamp of Government approval, and the uniform quality of which would both stimulate its domestic consumption and encourage its use in foreign countries. Such a plan would seem to commend itself to the judgment as being founded on wide-reaching principles of prudent and patriotic policy. The cattle-raiser of the West would be spurred on to maintain the best physical capacities of his herds, while the Eastern consumer would rest easy under the assurance that his beef supply was being selected for him under the highest guarantees that could possibly be secured. How would the other proposition operate? Every State would have its own system of inspection, the varying conditions of which would, of necessity, be amenable to political manipulation. Party influence, and not personal capacity, would be the test of the inspector's eligibility. The Eastern butcher would be overrun with low-grade cattle in the scramble that would ensue to reach the market in the cheapest manner; the Eastern farmer would be unable to compete against the cheaply-matured Western product, and the best beef would be of inferior quality. In this general deterioration, which we have not drawn with exaggerated emphasis, the home consumer would be the helpless victim, and the foreign export trade would pass into oblivion. In fact, all parties would be sufferers should the narrow policy advocated by only a small clique of short-sighted Eastern agitators prevail. The reasons in opposition to such an outcome of the controversy are so plain and so cogent that there probably is little real cause for apprehension. Meanwhile, we commend the opinions set forth in the article above referred to to our readers' careful perusal, as they embody a large amount of good sense and practical thought on a subject which is of great importance to every housekeeper and family in this community, but the discussion of which has been too largely monopolized by a clique of tricky self-seekers, jealous of success which they have not the shrewdness to achieve for themselves.

OUR CORN PRODUCT.

While European countries, with their dense populations and low wages, are interested in obtaining a cheap and wholesome supply of food, there is probably no article of food that is so cheap and wholesome, and that can be utilized in so many ways, as our American Indian corn or maize. It is to be hoped that the Paris Exposition this summer will serve to make Europeans better acquainted with the value of American corn. It will also serve to secure a new outlet for one of our staple farm products, which now finds a market abroad for only about 4 per cent. of its harvest. The canning business also is deeply interested. Every possible means should be taken to instruct our European brethren in the many hundreds of ways in which corn can be utilized, not only as a delicious and nourishing human food, but as a superior substitute for oats and barley for cattle and horses. A few statistics will show how much the United States are interested in having Europe understand what a valuable commodity we are offering them.

The AMERICAN ANALYST has already published many receipts for the preparation of corn, and will continue to do all that lies in its power to extend this useful information regarding our greatest crop. It is a matter of national importance, and Congress, the various State authorities, commercial exchanges, and especially the press, should do everything possible to convince Europeans of the incalculable value of corn as a food. Last year we produced 2,000,000,000 bushels, which at the present low price will bring us in nearly \$700,000,000. Take the single State of Iowa, and the corn reached in 1888 the enormous total of 321,629,952 bushels. The average price paid was only 23 cents per bushel, but even at this low price the commercial value of the crop in that State alone was \$74,000,000. This is almost equal to the value of all the gold, silver and lead mined in the United States in 1886, which was \$87,535,000. It is almost a larger sum than all the railroads in the United States paid in dividends on stocks in that year. It is \$8,000,000 more than the total net earnings of all the national banks in America, and is considerably more than the total dividends paid by those banks in 1887. It gives to every man, woman and child in the State, after reserving seed for 12,000,000 acres, nearly 12,000 bushels, or six tons of corn. From the official returns of the Iowa Agricultural Society, the yield of the leading corn States is as follows:

	Acres.	Bushels.
Iowa.....	7,797,090	321,629,952
Illinois.....	7,047,813	277,726,451
Indiana.....	3,419,377	128,436,284
Kansas.....	5,574,465	168,754,087
Missouri.....	6,447,168	210,832,394

Ohio.....	2,460,082	90,423,821

Total for the seven States... 1,281,919,349

NEW YORK AS A SUMMER RESORT.

The discomforts of the conventional summer country resort are being every year more impatiently tolerated, and to a large class of philosophical reasoners, mostly confined to the male sex, however, the superiority of New York City as an abiding place during the "heated term" is genially acquiesced in. The advantages of the city for that purpose are briefly and accurately delineated by the *Sun* in referring to a report that President Harrison is already hunting up quarters in which to spend the heated term of the coming summer. The *Sun* "feels free to say that this paramount American city of New York may be a refreshing and attractive place of abode during the hot weather. He can lead a very quiet life here, as many of our people do, enjoying the invigorating sea breezes from the south and the soothing airs from the hills that lie northward. He can find pleasant parks in which to take a stroll, pleasant waters, salt or fresh, in which to take a sail, pleasant tracks on which to take a drive, pleasant places in which to take a glass of pop, and tip-top barber shops. In short, he can spend as agreeable and profitable a vacation in this town as in any other part of the widespread American Republic."

SHORT-SIGHTED MAINE.

The anti-cigarette movement progresses slowly, but its ultimate success is as certain as fate. We recorded last week the introduction into the New York legislature of a bill prohibiting the use of cigarettes or cigars by minors. We hope the measure will prevail. On the 6th inst. a somewhat similar bill was discussed in the Maine Senate, where it was unluckily defeated on grounds of local policy. Its purpose was to prohibit the sale of cigarettes, tobacco or snuff to minors; also prohibiting the giving of these articles to minors. The bill was instigated by the Women's Christian Temperance Union and was favorably reported by the Committee. The most effective argument against the bill

was made by the Aroostook Senator, who declared it would ruin many traders in his section who derive a large part of their income from sales of tobacco to French Canadians, young and old, at work in the woods. The bill consequently was defeated by a vote of 17 to 14.

MACARONI.

WHAT IT IS MADE OF, HOW IT IS MADE, AND WHERE IT IS MADE.

Properly speaking, macaroni is a food peculiar to Italy and the Italians. In fact, the Italians are the only people who understand how to properly prepare macaroni for the table; but since within a few years macaroni has come into very general use in this country, it has become an esteemed common article of food with Americans and Europeans, and they are beginning to understand how to properly prepare it. That it is of Italian origin there is no doubt. It is now largely manufactured in Chicago and distributed from there extensively, though the industry is under the control of Italians. The modern roller process of milling is responsible for this change—that of reversing circumstances, so that whereas, fifteen years ago, nine pounds out of every ten used were imported, now the case is exactly the opposite. The roller process wheat flour is the best for making macaroni, and the Italian-American who found it out knew a good investment when he saw it. The process of manufacture is simple and cannot avoid being cleanly. In making macaroni, the very best flour is simply kneaded into a dough, water only being used. It is then passed through a mixing machine, a very ingenious device, and is kneaded by means of a heavy polished iron roller weighing about two tons. It is then pressed in cylindrical iron presses through a perforated mold placed in the bottom of the cylinder. In the centre of these little perforations there is a cone much like the mold used in making clay pipes, which produces the familiar hollow tubes. This is macaroni mezzani. Then, again, according to the needs of the trade, the simple dough is cut into most complicated and fantastic figures, the shape being as ingenious as the inventive faculty of man. There are over 200 different shapes in all, some being made in the form of stars, letters of the alphabet, sea shells, corrugated forms, ribbons and the numerals, as 1, 2, 3, 4, 5, 6, 7, 8 and 9. The fine, silk-like thread is called vermicelli and filleni—*vermicelli* meaning worm-like, and *filleni* filament. There is one kind which comes in short pieces, about an inch long. This is known as mostacioli and is a Genoa macaroni. Some kinds that are used for making soups are Stella-Semi-di-Cicora, Rosa marina, Tubettini, Semi melone, Ditali, Zita Tagliati, Mezzani Tagliati and Acini de Pepe. These are cut up in the form of grain, rice, little stars and the like. Those in common use are in the form of long, hollow tubes and are known by the names of Spaghetti, Macaroncelli, Zita, Vermicelli, Vermecellini, Perciatelli. All of these are manufactured in and shipped from Naples. Genoa macaroni is known by the numerous names of Danatalli, Reginetti, Bavettini, Forati, Fidelini, Danatali, Rigati, Mostacioli, Spaghetti in fancy shapes, Ditali, Reginin, Da Frati, Dapanieri, Fidelini, Lasagnetti and Rellalaga. That of Naples is mostly white and yellow. The yellow macaroni is colored with saffron and eggs. There are also brown and grey macaronis. Some macaroni is as fine almost as hair, while others are as large as a man's finger. The climate and the water of Italy are what make the difference between the macaroni manufactured in Italy and that made in America. As much American as any flour is used in the manufacture of macaroni. The millions of boxes which are imported into this country yearly contain about 25 pounds each. New York is the principal importing point. The boxes are covered around the edges with pink or blue paper, so as to exclude the air. There are many different brands manufactured, and, as in other goods, these different brands differ widely in

quality and value. The whiter kinds are said always to be the best. When cooked, macaroni should not crack or become flattened when subjected to hot water, but should retain its cylindrical form and should swell considerably, otherwise it lacks the important glutinous property, and indicates that it is made of not the best quality of wheat. Macaroni is made quite extensively in Marseilles and other places in France. One peculiarity of this staple article of food is that it is almost proof against climatic changes and influences. It is related that in one of the *cache's* constructed by Sir John Franklin's party a box was found intact and untainted, forty years after, and at the time of the Greely rescue, the first food served the survivors was macaroni soup. Dr. Livingstone always endeavored to keep a supply of macaroni while engaged in his African explorations, but some time ago the statement was published that Henry M. Stanley's supplies had been reduced to a quantity of vermicelli.

LEATHER MADE FROM WOOD.—Dr. George Thenius, of Vienna, has a process for the manufacture of artificial leather from red beechwood. The best wood for the purpose is taken from 50 to 60-year old trees, cut in the spring, which must be worked up immediately, bark peeled off, steamed, treated with chemicals in a kettle under pressure, and exposed to several more operations, which the inventor does not mention, as he wants to have them patented. From the prepared wood strong and thin pieces are made by means of heavy pressure. The inventor states that a solid sole-leather can be obtained which he claims is superior to the animal leather in firmness and durability, and can be worked up in the same way as animal leather, nailed and sewed.

QUEER FOOD VENDERS.

HOW A PORTION OF THE METROPOLITAN FOOD SUPPLY IS HANDLED.

There are about 3,000 persons in New York—not quite half them licensed—who make a living out of “hawking” second-class commodities of life. Some of them fill a real want in the poorer sections of the city, but not a few depend mainly for their success upon the irresistible temptation that, to some minds, exists in the prospect of getting things for less than their value. Through the winter our commission merchants are constantly in receipt of large consignments of game from Maryland, Illinois, Michigan, Kansas, Missouri and elsewhere. If the weather is at all warm and humid, ducks and other game birds must be handled very promptly. Experts sort them over when received, tossing out all that have “turned soft” or show a tendency to do so. The others are hung up by the heads—in which position they will keep best—and are sold at good prices. But the “soft” ones are made up in strings and bunches to be sold at whatever prices they will bring. The fellows who “hawk” them about are carefully gotten up in the guise of hunters, with long boots, shooting coats, and sometimes guns, if the birds are particularly “queer.” They always pretend to be from the country, and, swearing that they “shot ‘em yesterday,” are ready to tell, with nice circumstantiality of detail, just where on Long Island or in New Jersey they had such good luck. An unsophisticated man who believes them will be amazed at learning how much good shooting there is close to the city. He will know more when he starts out to shoot his own game. The reasons that the fellows give for selling their birds away below market prices are that they “want to get back home,” that “birds are so plenty a man can make plenty of money shootin’ them without bein’ a hog,” and that they “don’t know what they rightly are worth.” The “buckster” wagons are the channel by which the stupendous quantities of poor and damaged fruits that reach New York in the fruit season are worked off among those who cannot afford the best. Bruised apples, molded and shriveled grapes, green and black bananas, damaged oranges, and half-rotten pineapples, even such as are beyond utilization in a canning factory, find ready sale on the streets. Of course the Health Officers now and then interfere with the vending of the very worst stuff, but far beyond where they draw the line it is still in eager demand, if its price is only low enough, in those parts of the “east side” that are thickly populated with Bohemian and Polish Jews, who seem absolutely reckless and indifferent as to what they devour if it is only cheap. Thus late in the season the howls of “Ap’s,” “Gerrapes,” and “Squinches” have given way generally to “Taters,” and “Cab’ges,” and many families and even small restaurants depend wholly for their supplies of those vegetables upon the street vendors, whose profits in such staple articles are small. To many inquiring minds a dark and noxious mystery clings about a peculiarly soft, tallowy, ranky, odorous, and slightly bitter cheese that is never found anywhere else than upon “free-lunch” counters. The veil may not be lifted from the secrets of where, how and by whom it is produced. Only the hawker, possibly, might tell, and he certainly will not. Ask him, and he simply replies: “I ketched it.” So far as buyers and consumers may know, its being began with him. Saloon keepers depend upon him for their supply of it, and the secret of its cost is kept between them and him. Other hawkers whose trade is entirely with the saloons are those who vend “bar greens” and lemons. The amounts of fresh mints, tansy and cresses used are considerable, and, though the profits on them are small, there is hardly any probability of loss, since they are easily kept fresh for several days, and the vendor who succeeds in building up a “line of custom” does pretty well. The best profits are made on limes, which are of irregular and often insufficient supply, but in constant

demand in the best class of saloons. From mention of saloon supplies furnished by vendors it seems a natural gradation to call attention to vendors who are practically saloons in themselves. There are such, and, singular as it may seem, most of them are women. Of course, they are all unlicensed and pursue their business in a shady and surreptitious way. They carry baskets of half-pint, pint and quart flasks filled with cheap liquors, which they peddle from room to room in tenement houses. As they have to compete with the lower classes of groghops and “morgues” their prices are necessarily extremely low and the quality of their liquors unutterably vile in proportion. Fifty cents per quart is supposed to buy their best grade of any kind of liquor, and all sorts—rum, brandy, gin or whiskey—cost the same. Their customers are generally women or men who pursue the humbler sedentary occupations, such as tailoring or cigar making, at home. Not a few of these cigarmakers, by the way, contribute the supplies for another class of surreptitious peddlers, fellows got up as sailors “ashore from a vessel trading to Havana,” who have alleged “smuggled” cigars, which they sell by the box very cheaply to half-baked clerks and others whose judgment is badly developed.—Times.

NATIONAL vs. STATE MEAT INSPECTION.

WHAT THE LIVE STOCK JOURNALS, THE BOARDS OF TRADE, AND THE GREAT DAILIES SAY.

The *Northwestern Live Stock Journal*, of Cheyenne, speaking of national inspection of meats, in representing the cattle raising interest, uses some very plain and convincing language. It says:

“The time has arrived in the history of this country when a system of national inspection of meat producing animals should be put in force. Our cattle, as a rule, are the healthiest on the face of the earth, but still there are some diseased cattle. National inspection should be established at all the great market centres where cattle are slaughtered by thousands and their products shipped abroad or to neighboring cities. This would satisfy all classes of consumers as to the healthfulness of the meat, and greatly stimulate consumption at home and trade with foreign countries. Our friends across the water have had so much experience and trouble with their own cattle from various diseases that they have become suspicious of all meat producing countries. They know that pleuro-pneumonia has existed in some of our eastern States, and that is sufficient excuse for condemning the cattle of all the States. The fact that the great bulk of our beef is produced in a region hundreds and thousands of miles away from all disease centres makes no difference to these foreigners for the reason that, being strangers to our country, they cannot take in the situation. All the governments of Europe are sticklers for “official action,” and nothing short of a governmental inspection will satisfy them as to the soundness of our meat product. This would open every port across the water to us and double our export trade in a very short period of time. This would mean a sharp advance in values at home, for the reason that it would give us an outlet for all of our surplus, which of late has caused so much trouble to producers. The only way to have an inspection that is thorough is to have it in the hands of government appointees who are not political wire pullers in the communities where they are called upon to serve. The business must be placed on a plane higher than the average municipal government. Such appointments are too apt to be given for services rendered in some doubtful ward, and not with an eye to the fitness of the man for the place. With national inspection inaugurated there would be a rapid return to prosperity in the cattle industry. Therefore the people should appeal to the Congress of the United States for immediate action on this question. There should be no division of opinion here, for the reason that it would help the producer and the slaughterer alike and give confidence to the consumers. Let us have national inspection.”

The same journal, speaking of State inspection, believes that such State inspection will lower values, and argues it as follows.

“The whoop of the butcher is heard in the land, crying aloud for State inspection of all live animals that are to be slaughtered and used for food. He desires that a law be passed, forbidding the bringing into any

State of the dressed product of the cattle, hogs and sheep of the land, or the movement of this dressed product from one incorporated town to another within the same State. To aid in the manufacture of a public sentiment in favor of the passage of such laws by the several States, the claim is set up that the exclusion of ‘Chicago dressed beef’ from all the towns in the east will throw the meat markets again into the hands of the local butchers and advance the price of the cattle raised in the east. This sop is thrown out to catch the eastern farmer and stock raiser, and bring the rural districts solidly to the support of the proposed measure when it comes up in the legislature for action this winter. The farmers of Indiana, Ohio, Pennsylvania and New York are chief political factors in their States, and their voice is potent in all measures. Hence the effort to capture them by a false presentation of the facts in the premises. Farmers, listen. The passage of the live stock inspection law, to be presented by the butchers of the country, will cost you a decline of twenty per cent. in the value of every beef animal you will have for sale. The voice of the butcher is the voice of the siren luring you on to destruction. On the contrary, let us reason together. To-day you are competing with Chicago dressed beef in the larger towns of the country where the consumption of meat is considerable, but the small towns are left to the local butcher and a very considerable trade, or demand exists for home dressed beef. Your cattle are fat and free from bruises and you realize a fair margin on your feeding, because you really have the edge on the live cattle market. Western cattle rarely come into competition with the beef steers of the farmer save in a few of the larger cities. But cut off Chicago, Kansas City, Omaha, St. Louis and St. Paul from their dressed beef product, nearly three million cattle a year, and you turn all these loose upon your local markets. The West is full of cattle cheaply raised and cheaply fed. They must be sold. If Chicago and the other western markets do not take them, they will be sent east to find a market. The country will be scoured from end to end to find a place for them. Your local markets will be overrun. When you are selling choice beeves at five and six dollars a hundred, the Colorado or Wyoming steers will be run in upon you in train load lots, and the local butcher, true to his instinct to buy the cheapest and sell the highest, will decline to pay you six dollars a hundred when he can buy something that will answer his purpose for three dollars. There will be no Chicago competition to urge him to buy the best in order to support his theory that home dressed meat is the best, and as the competition is gone there will be no object in having the best. The trade will be in his hands, and he will so manipulate it as to realize the most. His philanthropy and zeal for the people will have vanished with the coming of the opportunity to sell cheap meat and the farmer will find himself the sufferer. The experience of every farmer in the land is that small markets are easily glutted, and an over supply means ruinously low figures. Five or ten cars of fat steers from the west would demoralize two-thirds of the markets in the east and reduce the value twenty-five to fifty per cent. Instead of having a local market, you would be forced to seek the great cities, there again to come in contact with western steers rendered cheap by reason of a long haul and a pauperized condition of body. Poor cattle are demoralizers of markets in all countries, and values of good droop in sympathy with the bad. Safety to the eastern farmer who hopes to feed cattle will vanish on the appearance of the cheaply matured western steer, and State inspection will carry them to the remotest corners of the consuming districts. Wash your hands of the scheme, for it means your ruin.”

In this connection, the same journal further ascribes the low price of cattle and high price of beef to where it really belongs:

“There are many amongst us who argue, and not without a good show of reasoning, that there is not now and has not been in the United States an over-production of beef in the true sense of the term. These reason that ‘over-production’ means a greater supply of the product than consumers will take at a normal or legitimate price for such product, which should bring it within the reach of such consumers. And notwithstanding the object lessons had at market centers, and that stockmen have been too often in the apparent position of those who should ‘take coals to Newcastle,’ when we consider that all through what has been to us a time of dire depression the prices of beef to Eastern consumers has been held to ‘82 prices, with in many localities an advance, we do not think the disclaimers of over-production have any laugh on them. There was a suspicious approximation in the dates when local butchers began ‘eating their white bread’ and wearing jewelry, and the time when producers of cattle slowed up on those practices—when Eastern butchers began flourishing with glitter, associations and fine properties, and Western stockmen were driven to renew notes on ruinous terms or bite the

dust. During these years of bitterness to the live stock industry it has been notorious that nowhere in the United States has beef been cheapened to the consumer. The local butchers have stood in the attitude of prohibitionists of the beef habit; and, while on the one hand they have all but ruined the producers of cattle by the cheapening processes and taking advantage of circumstances and conditions, on the other they have raised the price of beef to the consumer to a scale that prevents use save with the well-to-do. As consumption has fallen off, the butcher has calmly raised the price and so makes the same money, while he handles less beef and takes less business chances. And so he brings about that abnormal state of affairs which gives color to his remarks as he tells cattlemen of over-production. Have not the local butchers wantonly brought about under consumption? It looks as though the local butchers of the country have been enjoying a 'dead grab' with both hands; and now, when they come before the legislatures and ask for local live inspection, one can only believe that they wish to intensify and perpetuate that state of affairs. Perhaps they have noted that Western cattlemen have found, in the packing and dressed beef interests, a buffer against butcher flintiness of soul—and want the earth. While no one will claim for the Chicago disseminators of beef products only motives of pure and simple philanthropy in the premises, we know that they take and pay for thousands of Western cattle every day which otherwise would not find market; and we know that the killing of that market by local live inspection would turn our affairs over to the tender mercies of the cleaver, the long, keen knife and the buzzard. An old law maxim is in effect that 'he who comes before the courts [or legislatures] of his country asking justice must come with clean hands.' The hands of the local butchers are red—literally with the blood of cheap cattle and high-priced beef, and, figuratively, with that of the cattle-raising industry and the more refining influences of life. If there is over-production in the cattle industry, local live inspection and the crippling or destruction of the packers and dressed beef people will cause the condition to stand out for Western producers with a ghastliness heretofore unthought of; if there is no over-production, the butcher-sought law, by lessening the Chicago capacity to take our cattle, would cut off our outlet, and by placing us more surely in the hands of the local butcher strengthen the false appearance. The local butchers have placed themselves without the pale of sympathy in their fight for this law from either producer or consumer of beef."

The Chicago Tribune of January 25th, answering the question "Can Pennsylvania get protection against the West?" logically says:

"High-tariff Pennsylvania desires a free export trade to the rest of the world in selling her products, but in producing them wants protection not only against foreign competitors, but even against other States of the Union. A despatch from Harrisburg gives this description of the bill introduced in the Pennsylvania Legislature to exclude Western dressed beef from the markets of that State:

"This committee has prepared a bill which will be introduced in the House early in the session. The bill provides for the appointment of inspectors in all parts of the State, whose duty it shall be to inspect all cattle on the hoof before they are permitted to enter the abattoirs. The bill also contains a provision which makes it a misdemeanor to expose, sell or offer for sale any dressed beef or any other fresh meat unless the animal from which it comes has been so inspected within the limits of the State. The effect of this is to debar the Chicago beef from the markets of Pennsylvania, which, outside of New York, are perhaps the most important for the syndicate in the country."

"Since the real purpose and effect of the measure is, as stated, to 'debar Chicago [which means Western] beef from the markets of Pennsylvania,' the bill is plainly unconstitutional, and would be set aside by the Federal courts as an unlawful attempt by a State to interfere with and destroy the freedom of interstate commerce. The attempt is under the guise of an inspection law to protect the community against the falsely alleged 'diseased meat'—to interfere with and, in fact, destroy the freedom of interstate commerce in dressed beef. The Supreme Court has repeatedly declared that it would exercise the greatest vigilance to prevent such abuses of power by the States under color of enacting quarantine or inspection laws. 'The object of inspection laws,' said Chief Justice Marshall in a leading case, 'is to improve the quality of articles produced by the labor of a country—to fit them for exportation or it may be for domestic use. They act upon the subject before it becomes an article of commerce among the States, and prepare it for that purpose.' Hence a bona fide beef inspection law would provide for inspection at the place of slaughter before the beef 'becomes an article of commerce among the States,' and with a view 'to prepare it for that purpose.' Such a method of inspection can only serve the purpose with a product like dressed beef,

where the examination must take place before the animal is killed, and not when the beef is offered for sale in another State. To demand that inspection on the hoof must take place only in the State where the meat is to be sold is equivalent to excluding the dressed beef of other States entirely—the good as well as the bad—and this cannot be done. The limit of an inspection law is to 'fit the article for the market and give the purchaser assurance that it is in proper condition.' Hence a law of that character framed to guard against the packing or dressing of diseased or tainted meat, and requiring inspection 'before it becomes an article of commerce among the States,' and intended to 'prepare it for that purpose,' would be valid, while an absolute exclusion of all beef dressed or packed in other States, without regard to its quality or condition, would be grossly unconstitutional. Some products, such as petroleum, for instance, may be inspected in the State where they are offered for sale, when the quality or condition may thus be correctly ascertained. In such cases the State may make local inspections, and permit only the sale of the product found to be in merchantable condition. But with dressed beef such examination can be made only at the place of slaughter before the article enters into interstate commerce, and in order to 'prepare it for that purpose.' Such a method of National inspection would be constitutional and proper, while the pretended inspection law proposed in Pennsylvania to exclude Western dressed beef and protect the butchers and stock-growers of that State from Western competition would be nothing less than an unlawful attempt to violate the Constitution of the United States and destroy the freedom of interstate commerce to get more tariff bonus for the over-fed Pennsylvanians. Pennsylvania has bought little and sold much to the West and waxed fat at the expense of this section, but she will hardly have the freedom of interstate commerce in any article wholly destroyed for her advantage."

THE BOARD OF TRADE OF CHICAGO HAS ALSO SPOKEN.

The Board of Directors of the Chicago Board of Trade at a special meeting January 24, 1889, unanimously adopted the following preamble and resolutions:

WHEREAS, Bills have been introduced into the Legislatures of Pennsylvania, Ohio, Kansas, Colorado and other States; and,

WHEREAS, Said bills are all designed to exclude from sale in such States dressed beef, hogs, sheep, green hams, shoulders, bellies, etc.; and,

WHEREAS, The success of these bills in these States, followed by others, would irretrievably embarrass and ruin the dressed beef industry; be it

Resolved, That we take pride in the industry, energy, and economy of our citizens who have built up in a few years a trade in dressed beef, hog and kindred products of remarkable magnitude, expending millions here annually for labor and materials, and also in the fact that their enterprise has greatly cheapened the price of beef to the whole country; and,

Resolved, That we earnestly protest against special legislation of this kind, leveled against a manufactured product of this State, as being unwarranted and without precedent, and calculated to provoke retaliation; and,

Resolved, That from the testimony of our City and State Boards of Health, and also from the recently published and convincing statement of Elmer Washburn, Superintendent of the Union Stock Yards, Chicago, we believe in no place in the United States is such care and vigilance exercised in the inspection of cattle before and after slaughter.

Resolved, That the pretense that dressed meats are diseased, advanced by the adherents of these bills, is a sham; that the sole purpose and design is to cripple and impair one of the great industrial enterprises of the country, and the false charges made by the supporters of such legislation will injure the reputation of our meat products at home and abroad and damage the cattle raising industry of the entire country.

Resolved, That a copy of these resolutions be sent to every member of the Legislatures before which bills are or may be pending.

AND FINALLY THE CHICAGO LIVE STOCK EXCHANGE.

At the regular monthly meeting of the Board of Directors of the Chicago Live Stock Exchange, held January 28, 1889, the following preamble and resolutions were unanimously adopted:

WHEREAS, Certain members of the State legislatures of Pennsylvania, Ohio, Kansas, Colorado and other States have introduced bills designed to exclude from sale in their respective States all kinds of fresh meats, unless the animals from which such meats are made are

inspected on the hoof and slaughtered within the confines of the States where such products are sold, and,

WHEREAS, The adoption of such laws discriminating against our animal food products would be followed by similar measures in foreign countries, as has already been done in the matter of our hog products, and would result in the ruin of the live stock and cattle raising interests of the entire country, and,

WHEREAS, The system of inspection of all animals slaughtered at the Union Stock Yards of Chicago is of the most thorough and radical nature, and is administered by practical and efficient sanitary and State officers; therefore,

Resolved, That we, the Board of Directors of the Chicago Live Stock Exchange, an institution having a membership of over 500, who are largely the owners, feeders and raisers of all kinds of live stock, and also the representatives of the principal live stock producers of the entire Western country, do most emphatically protest against the enactment of any such laws as pernicious and unwarranted class legislation.

Resolved, That our cattle, hogs and sheep were never healthier, and that the claims made by advocates of such measures that our fresh meat products are diseased and unhealthy are without foundation in fact, and only made as a pretense to secure such legislation, their object being to shut off legitimate competition and advance their own personal interests.

Resolved, That we are heartily in favor of national legislation providing for a system of rigid inspection of all animals slaughtered for food, by experienced, competent United States government officers, not only for the protection of our own meat consumers, but as an assurance to foreign powers that we are in favor of, and strong advocates of, healthy meats.

Resolved, That we hereby extend to any legislative body before whom any State inspection bills may be pending, a cordial invitation to send an unbiased committee of their number to this market, to thoroughly investigate the system of State and local sanitary inspection in operation at these yards, and convince themselves of the rigid scrutiny every animal landed here has to undergo, before being slaughtered or re-shipped.

CHARLES W. BAKER,

Secretary."

NITROGEN.

THE MANIFOLD USEFUL PROPERTIES OF A MYSTERIOUS ELEMENT.

There is a substance which is invisible, which has neither odor nor taste, which is perfectly inactive chemically, and, in fact, possesses no qualities of matter, except weight and bulk. This is the gas nitrogen which constitutes four-fifths of the atmosphere which surrounds us. It is apparently a dead, inert form or manifestation of matter, and yet it is, perhaps, one of the most important and useful of all the elements, and if it should vanish from the universe life would cease to exist. This apparent paradox is explained by the fact that by its combination with other elements the remarkable characteristics of nitrogen are awakened into action. The gas is neither poisonous, corrosive, explosive, nutritious nor medicinal, but combined with carbon and hydrogen it forms the deadly prussic acid; with oxygen and hydrogen, the strong corrosive nitric acid; with hydrogen alone, the strongly basic alkali ammonia; with carbon, hydrogen and oxygen, the terrible explosive nitro-glycerine; and with the same elements in varying proportions, it forms the albuminoids, the gelatines, the glutens, and other strength-giving elements of our food, or the indispensable medicinal agents—quinine, morphine, atropine, strychnine, veratrine, cocaine, and many others. Although nitrogen is tasteless, it forms an indispensable part of the flavors of the peach, plum, apricot and other delicious fruits, as well as coffee, tea, chocolate and tobacco. Without smell, it is found in many of the most powerful and delicious perfumes, as well as in the nauseating odors of putrefaction. Present in immense quantities in the air, it furnishes little or no support to vegetation, but combined with other elements the amount present in the soil determines its fertility, and the amount of crops which may be raised upon it. Colorless and invisible, nearly every dye-stuff or coloring matter known contains it in

greater or less proportion. Harmless and powerless by itself, when combined with another non-explosive gas, chlorine, it forms the most powerful explosive known, of which a ray of sunlight is sufficient to arouse the terrible destructive power. And yet, notwithstanding the pre-eminent importance of this element in the affairs of life, there are but few of its combinations which we can form directly. Millions of tons of nitrogens are all about us, but not a single grain of morphine or theine, gelatine or albumen, aniline or naphthaline, can we make from it. Only the mysterious vital force working in the natural laboratory of the vegetable or animal organism can build up most of these complicated molecules from their ultimate elements, and place the atoms of nitrogen in their proper position like the beams or stones of a building. Our wonder at the marvelous power displayed by these organisms is none the less when we see what simple, common and uncharacteristic elements are used by them in making up their wonderful products, and we can only say that it is a part of the great and unsolvable mystery of Life. Neither can we explain satisfactorily from a chemical standpoint the properties and reactions of this strange element; by itself it is nothing, but united with other elements, some almost equally inactive, the combinations thus produced manifest the most powerful and positive chemical and physical properties. It is like the springing into life of dead matter, but there is no system of chemical philosophy which can give a reason why it is so. It is the part of the chemist to observe and record the facts connected with the properties of different forms of matter, and in time we may from these facts construct a rational theory, but we are still a long way from a clear comprehension of the phenomena of the universe. There are about as many things in heaven and earth still undreamt of in our philosophy as there were in Shakespeare's time, and the further we advance towards the end the more the field widens and appears to be of illimitable extent.—*Popular Science News.*

CORRESPONDENCE.

THE REAL CATTLE INTERESTS.

NEW YORK, February 9, 1889.

Editors ANALYST: It is an old saying that when thieves fall out, honest people get their own. Much instructive as well as amusing reading can be got from those papers which claim to look closely after the interests of the cattle grazers, the farmer and the butcher. Whenever it seems to best serve their purposes, different sides of the argument are used with almost impartial division. Often this argument on both sides may be found in the same number in different columns. I have before me, as I write, a copy of the *Texas Farm and Ranch*, which frankly admits that the "big four," as it affectionately calls the four beef dressing firms of Chicago, furnished a market for cattle when it was sorely needed. It upsets this virtuous assertion by adding that it was a single market without competition. Of course it was. The enterprise and capital of the Chicago people was alone willing to take these cattle and pay such a price for them as would enable them to handle them profitably. If the ranchmen had not thought it a good opportunity to sell, they were not compelled to bring their cattle to what they admit was the only market open to them. Now as to the cause of the heavy decline in the price of cattle. This has often been laid at the door of the alleged cattle monopolists in Chicago, but now it suits the purpose of this representative cattle journal to frankly admit that the cause of the decline in prices was an entirely different one. Our friend goes on to enumerate them:

"What are the facts? From 1883 to 1887 the cattle business was on a boom. Breeding cattle had been attempted in the Northwestern States and territories, and there was a large demand for cattle for purely

breeding purposes. The fancy prices which this experimental demand created caused the boom. The experiment proved a failure, seventy-five per cent. of the cattle dying within two winters. The boom exploded. Prices dropped from \$25 per head in 1883 to half that amount in less than two years. At this time cattle were rushed on the market in excessive supplies, and the big four bought them at panic prices. Probably anybody else who happened to have the money and the judgment to back it would have done the same thing."

It further admits that owing to these Chicago people being the only extensive cattle buyers in America, with their large capital, business sagacity and boldness, they have succeeded in drifting the cattle currents of the continent to Chicago and its tributary points. What is there to justly complain of in all this? Had the cattle ranchers and farmers been given the same advantages, they would have established a cattle market wherever they could have got the largest prices for their cattle; but they had not the necessary—well, call it luck, if you will—but a better term would be, they did not know how to take the tide at the flood. Meanwhile the ANALYST is on the right path.

CLEAVER.

DOMESTIC DUST.

SOME HINTS ABOUT DUSTING AND HOUSE CLEANING GENERALLY.

The end to be achieved is the abolition of dust and dirt. The first object, then, is the collection of these obnoxious substances in a small compass, preparatory to disposing of them. Begin with the small articles, washing and wiping those that require it, and dusting others. Then, when perfectly clean, remove them from the room. (In cases where this is impossible they may be laid upon the bed, which must be covered with a large dusting sheet.) The furniture must now be brushed and cleaned, so much of it as is possible they may be removed from the room, the rest covered with dusting sheets. Now, dust the walls thoroughly and every mirror and picture, especially its back, with a large feather brush. By this time we will assume that all the dust and dirt of our apartment are gathered upon the carpet. With a broom clean every corner, working always toward the centre. Now, when these lurking-places are thoroughly cleaned out, bring in a carpet-sweeper, and with it gather up the whole collection, driving the machine systematically back and forth as the farmer does his plow, leaving a clean furrow each time. When this is accomplished wait a few moments until the dust can settle, so that you may know where it is. Again bring forward the large feather duster, brush again the pictures and mirrors, washing such as have soiled glasses. Remove the dusting sheets and shake them from the window, or somewhere out of doors. Restore the furniture and ornaments to their places, and the work is done, with one-half the weariness, and an excellent result, impossible without care and system. As to carpets, beyond the regular weekly cleaning, certain articles in a house, as well as the dwelling itself, must have a periodical overhauling, on which their welfare and services depends. The intervals at which carpets should be taken up and thoroughly cleaned and beaten depends upon their texture and the frequency with which the apartment where they are laid is used. In ordinary cases it is a good rule to take up Moquette, Axminster and Wilton carpets once in three or four years, and Brussels and velvet once in two or three. The texture of these is so firm that the dust does not sift through, and sweeping will remove all that accumulates upon the surface. Ingrain and three-ply carpets should be lifted annually, and if the room is very much used twice a year is not too often. The housekeeper will even then be astonished to observe the accumulation of dust beneath. To many people it does not seem to occur that a carpet can be washed. They would be astonished to see what an improvement can be made in this way. Take a gallon of water in which

two ounces of carbonate of ammonia have been dissolved, and apply it with a soft rag to each breadth. If there be any pronounced soils and stains, grease spots or other, procure from your butcher a pint of ox-gall. Mix it with three quarts of water and apply with a soft scrubbing brush, taking care to rinse thoroughly afterwards with pure water. A large brush of ostrich feathers is, of course, the best thing to use in brushing down wall paper; as most housekeepers know, these are expensive and likely to be soon destroyed if intrusted to servants. A soft cloth tied over a broom is a good substitute, and economical. If these do not remove the smoke or grime that accumulate, take a loaf of stale bread, divide it into quarters, and after moistening the cut surfaces very slightly, proceed to rub your paper very carefully, beginning always at the ceiling and moving your hand downward in straight lines. The results will be surprising. All careful housekeepers secure an extra roll when having their walls papered. If by accident your walls are broken or defaced at any point, cut a piece of the new paper larger than the marred spot, be sure it matches perfectly, cut the edges irregularly, paste (boiled). The eye will never trace the mended portion. If there are any spots of grease on your walls, mix some fullers' earth with a little ox-gall and cold water until you have a stiff paste; spread it on the spot and cover with blotting-paper; let it stand for several hours. If, on brushing it off, any of the grease remains, repeat the operation.

THE CONSPIRATORS FOILED.

PENNSYLVANIA REPUDIATES THE ANTI-DRESSED BEEF PLOT.

A dispatch from Harrisburg, Pa., of February 9, says: In the House yesterday the resolution to have the Anti-Dressed Beef Bill, which had been reported with a negative indorsement, placed upon the calendar was voted down, the nays 75 and the ayes 81, less than a majority of the whole House. The bill prohibited the bringing of dressed beef into the State.

AN AUDACIOUS AND INDEFENSIBLE SCHEME.

The N. Y. *Commercial Bulletin* of February 9 says on the above subject: The bill to restrict the sale of dressed beef has found its way into the New York Legislature, with the prestige of a favorable reception at Harrisburg and the capitals of other neighboring States, and with the indorsement of organizations that would be benefited by the prohibition or the sale of Western meat in Eastern markets and by the compulsory purchase at high prices of beef killed within the limits of the State in which offered for sale. The bill is, perhaps, the most audacious and indefensible of the large number of discriminating measures brought forward since the Federal and State Governments gave their sanction to the suppression of the oleomargarine trade for the benefit of butter dealers. The beef bill aims to obstruct the sale of dressed meat, so that Eastern butchers may command markets in which they cannot now compete. It is inexplicable that in the present state of public sentiment propositions should command popular support which have the avowed purpose of interfering with the sale of cheap food, and interposing the power of the State to enable an unsuccessful competitor to command a market in which he has been undersold by the cheaper supplies furnished by a legitimate rival.

AMERICAN WATCHES.—A first-class American watch, well-kept, will last thirty years, or sometimes even longer, before the works wear out, but the average life of an ordinary low-priced American watch is ten years, and that of a Swiss watch of the same grade seven years. The length of life for a watch depends largely on the number of its jewels. The range of prices for American watches runs from \$5 to \$500, the costliest being a split second minute register timing watch. In the United States about 3,500 watches are manufactured every day.

GLYCERINE.

SOME OF ITS PRACTICAL USES.

As a dressing for ladies' shoes it renders the leather soft and pliable without soiling garments which come in contact.

For excessive perspiration of the feet, one part of burnt alum with two parts of glycerine should be rubbed on the feet at night and a light, open sock worn. In the morning the feet should be washed with tepid water.

For bunions and corns, equal parts of Cannabis Indica and glycerine should be painted on the surface and covered with Canton flannel.

For the face, oatmeal into a paste with two parts of glycerine and one of water may be applied at night under a mask as a complexion improver.

As a supplement to a bath, two ounces of glycerine in two quarts of water will render the skin fresh and delicate.

For coughs, one to two tablespoonfuls in pure rye whiskey or hot rich cream will afford almost immediate relief.

For consumption, one part of powdered willow charcoal in two parts of glycerine is a panacea.

For diseased and inflamed gums, three parts of golden seal, one part of powdered burnt alum, and two parts of glycerine, rubbed on at night, after first removing any tartar.—*Scientific American*.

ANCIENT TABLE MANNERS.

COOKS AND TABLE CUSTOMS OF THE GREEKS AND ROMANS.

In an old Roman household, tradition tells us, the head cook was a high-salaried officer. Of course, your quick thoughts revert to the genius who presided over one famous dinner that Mark Antony gave to Cleopatra, and that was so sumptuous that it actually drew praise from that haughty dame, which unusual appreciation so delighted the infatuated Antony that he summoned the cook and gave him an entire city as a recompense. But it was no extraordinary thing for Roman cooks to command salaries of \$4,000 a year. The kitchen was a vast apartment separated from the house, and was governed by the "Archimagirus," or chief cook, who held the most stringent rules. These supreme officers were the recipients of no set salaries; they drew ample reward from their artistic fame. "Above all men," they were wont to say, "we are intrusted by the gods with the secret of human happiness;" and they asked for no higher recognition of their services. The Sicilians, however, ranked as the best cooks in olden times, and although the Romans many times offered them incredible sums for their services they were obdurate and never deserted their posts. It was one of the ancient customs to recline at the feast; and the banqueting rooms, gorgeously carpeted, were fitted up with luxurious couches. Heraclides says that the Persians were the first who engaged artistic experts especially to arrange these couches; and that on one occasion Artaxerxes presented his friend Timagoras, the Cretan, with a tent of great size and beauty, and a couch with silver feet, with an accompanying message saying: "I send you, O Timagoras, the couch and coverlets and a servant to arrange them, as this is a matter the Greeks know not of." It is related of this same Cretan, that he had so completely secured the favor of the Persian king, that the latter invited him to a banquet of the royal family, an honor never before paid to any Greek. Here is another custom of the ancients, and one in which we can see the origin of our menu cards. Each guest, as soon as he had settled upon his couch, was handed a paper upon which was written the name of every article to be served at the feast and in the order in which it was to be served—a convenient, if not an indispensable custom. Indeed, in the present day we

would be apt to look upon the omission as barbarous, for what could be more so than to keep a man of moderate gastronomic capacity in ignorance of some coming delicacy, and thus allow him, in the dark, to crowd it out with some previous dish or dishes which he may tolerate rather than fancy.—*February Table Talk*.

CORPULENCE.

SOME SUGGESTIONS FOR THE REMEDY OF OBESITY.

A correspondent of the *Journal of Commerce*, inquiring for a remedy for excessive corpulence, receives the following response: "Corpulence is due to an excess of hydro-carbon in the system. All oleaginous food, as fat meat, butter, gravies, milk, nuts and Indian corn, is a direct contribution to obesity. In addition to these the hydro-carbons are elaborated in the system by the starch and sugar of bread, potatoes, rice, tapioca, arrow-root, and various other vegetables, fruits and roots. Alcoholic stimulants are favorable to the deposit of fat, and the exact opposite—to wit, the free use of aqueous drinks—is still more conducive to corpulence. If a man could live wholly on a nitrogenous diet, confining himself to those azotized principles fibrine, albumen and caseine, which go to renew the waste of the tissue and are not convertible into fat, he would soon become as lean as he could desire. But these principles cannot be obtained in their purity in ordinary food, and if they could be the diet closely maintained would after awhile be fatal to the system. Some approach to it, however, may be made, and this is recommended to all who suffer from excessive corpulence. The normal diet of one in perfect health would be one of the nitrogenous principles to five or six of the others. A reduction of the latter so that the proportion shall be one to three will make a very perceptible change in the physical condition. To effect this let the diet be lean meat (no pork), lean fish (no salmon), cheese, peas, beans, cabbage, turnips and acidulous fruit. Avoid farinaceous food, including bread, pastry and potatoes, and all fats (butter especially) and sweets, saccharines of all kinds being especially fattening. Drink claret (with little or no water) and other sour or light wines, and if flour is used at all let it be in bread toasted very dry. A perseverance in this diet will inevitably reduce the avoirdupois of any human body."

HOME VENTILATION.

ITS IMPORTANCE FOR THE SUPPORT OF HEALTH.

An old writer says: "When men lived in houses of reeds, they had constitutions of oak; when they live in houses of oak, they have constitutions of reeds." Evidently the truth inculcated is that the better the air and more bountiful its supply, the healthier is the inmate of a house, be it palace or cottage. Too often the very wealth of a house builder militates against his splendid mansion becoming that ideal home of comfort that it should be, and the inmate of some wretched, leaky little hovel, perched on a rocky hillside, will have every advantage over such a one as regards vigor of body and elasticity of spirits. Science tells us that there is a needed respiration for the walls of our houses, and that, fortunately for us, whether conscious of it or not, the materials of which our modern houses are made admit of the passage of air in a greater or less degree. Brick, stone, wood and mortar, solid as they look to us, are easily pierced by that volatile fluid which we call air. Such is the elasticity of air that, fortunately for us, a slight force only is needed to put and keep it in motion. The difference of 20 deg. Fah. in temperature between outdoor air and indoor air will cause the passage of about eight cubic feet of air each hour through every square yard of wall surface made of brick. A plastered wall also admits of the free passage of air, and actually serves as an efficient

filter by arresting the progress of dust or any of those particles—often injurious—with which the atmosphere is laden. Heat is the great motor for ventilation, whether natural or artificial, and the great problem in winter is to introduce a sufficient quantity of pure warmed air to make one's room comfortable without attendant draughts that shall imperil the health of their occupants. Open fire-places, whether the fuel consumed in them be wood or coal, are among the very best ventilators that we have, and yet the question of expense is bringing them more and more into disuse. But there is no need to be discouraged on that score, because the eyes of all practical people are being opened to the importance of combining the twin forces of heat and ventilation in such a manner as shall tend, in the future, to prolong life as well as render it more comfortable and enjoyable.

SACCHARIN.

ITS IMPORTATION INTO FRANCE PROHIBITED.

The following is an abstract of the preamble of the bill now before the French chamber prohibiting the importation of saccharin into France: "The attention of the administration has been directed to a new coal tar product known as saccharin. This substance, which differs essentially in its elementary composition from vegetal sugars, possesses much greater sweetening power, a quality that was sure to lead to its being used as a substitute for sugar in many cases. We learned from our consular agencies abroad that factories were being established in certain countries for the purpose of bringing saccharin into competition with beet and cane sugar, not only in France, but also in other neighboring markets. The high cost of that substance seemed to constitute an insuperable obstacle to its general adoption, but lately the situation has changed. It can now be more cheaply produced, and already it is extensively used, mixed with glucose, in the preparation of jams, syrups and liqueurs. It has, therefore, become an urgent necessity to provide a remedy for the evil, in the interests of the customs receipts and that of the health of the consumer; for it has been shown by the report of Drs. Brouardel, Pouchet and Ogier, in the name of the consulting committee of hygiene, that saccharin, and the various preparations derived from it, are noxious to health, and ought to be prohibited. Wherefore the government has deemed it expedient to prohibit the importation of saccharin and saccharinated substances."

MIND AND AVOIRDUPOIS.

RELATION OF BRAIN WEIGHT TO INTELLIGENCE.

He does science a favor who dispels the least of still existing scientific superstitions. A scientific superstition has long prevailed in regard to the weight of the brain as compared with the weight of the body in man and other animals. Most physiologists hold that the weight of the human brain is one-fortieth of that of the body, and that such a proportion is not attained by any other animal. This flattering superstition is dispelled by some recent investigations of Dr. Joseph L. Handcock (*American Naturalist*, XXII, p. 537, June, 1888) on the weight of the body and brain of birds. He finds that in the smaller and more intelligent birds the weight of the brain rises to one-thirteenth that of the body in *Stetophaga ruticilla* (American redstart), and to one-seventeenth in *Regulus calendula* (ruby crowned kinglet) and *Parus atricapillus* (black capped chickadee); and in the larger and more sluggish of the tribe it often remains higher than in man or any carnivora.

A PEEP INTO THE FUTURE.—Friendly Spirit—"By the way, you have not met Mother Eve yet. Let me introduce you to her."

Spirit of Anthony Comstock (with averted face)—"I fear I could not bear it. Is—is she properly attired?"

DOMESTIC DIETETICS.

SPECIALLY PREPARED, FROM PRACTICAL TESTS, FOR THE
LADY READERS OF THE "AMERICAN ANALYST."

SEASONABLE FOOD.

February.

MEATS.—Beef, mutton, ham, kidneys, liver, venison, sausage, pork.

GAME AND POULTRY.—Grouse, hare, pigeon, chicken, duck, turkey, goose.

FISH.—Bass, cod, crabs, eels, carp, catfish, flounder, halibut, herring, lobster, mackerel, mussels, oysters, perch, pike, rock-fish, salmon, smelt, whitefish.

VEGETABLES.—Artichokes, beets, beans, cabbage, carrots, celery, garlic, lettuce, onions, parsley, parsnips, potatoes, shallots, spinach, tomatoes, turnips.

FRUIT.—Apples, bananas, grapes, oranges.

PRACTICAL RECIPES.

CLAMS.—One hundred little neck clams, one pint of milk, four hard boiled eggs, pepper, mace, allspice, butter, flour; drain the clams in a cullender and pass a little fresh water over them; chop them up finely and put them into a stewpan with the milk over a brisk fire. Chop the eggs; add these to the clams as soon as they begin to boil. Rub as much butter and flour together as is required to thicken them; stir this in and add pepper, mace and allspice to taste; let the whole boil not longer than three minutes, then immediately serve.

VEAL CUTLET WITH CARROT SAUCE.—Select a cutlet from the thick part of the leg, beat it with a bat and brown it in a little hot butter. Boil a dozen small two-inch young carrots half an hour, in water slightly salted; mash them fine, rub them through a sieve and season with salt, pepper and two ounces of butter. Cover the bottom of a hot dish with the carrot purée; place the cutlets on top and serve.

TONGUE PIE.—Use equal parts of cold tongue and cold poultry or roast pork; season and place them in layers; add sufficient cold gravy to moisten the meat; bake with thick upper crust.

BEEF STOCK.—Put five pounds of lean beef in a stock pot; two gallons of cold water and some salt. Start to boiling slowly. Skim well and add two carrots, two onions, five cloves, three leeks, green celery, one turnip and one parsnip. Boil slowly for four hours. Remove all the fat and pass the liquid through a napkin. Add some caramel for coloring. Put away in a vessel and use as required.

SPICE CAKE.—One cupful of brown sugar, one of molasses, one of butter, one of milk, one-half teaspoonful each of nutmeg and cinnamon, one teaspoonful of ground cloves, three eggs, four small cupfuls of flour and two teaspoonfuls Horsford's baking powder.

SPONGE CAKE.—Eight ounces of corn flour, six ounces of white sugar bruised, four ounces of butter, three eggs, one teaspoonful of Horsford's baking powder and flavor with lemon. Beat all well together; bake in small tins in a slow oven.

FRENCH CAKE.—One cupful of sugar, one quarter of a cupful of butter, one-half cupful of milk, two eggs well beaten, one and a half cupfuls of flour, one teaspoonful of cream tartar, one-half teaspoonful of soda; one cupful of currants, a few slices of citron, teaspoonful of mace or nutmeg. Bake in thin sheets, frost and cut in slices.

HOMINY FRITTERS.—Two teacupfuls boiled hominy, one-half cupful cream, two tablespoonfuls corn starch, two eggs, one-half teaspoonful baking powder. Mix ingredients; drop into hot fat by spoonfuls; fry brown.

GOUT.

RECIPES FOR CULTIVATING THAT INTERESTING FIRESIDE
COMPANION.

Under the title, "Recipes for Making Gout," an English society journal, having exhausted its best advice as to the prevention of this dread malady, lays before its epicurean readers some specimen compounds peculiarly adapted to develop gout in those previously free and to excite its most virulent symptoms in the already afflicted. It has medical authority for its promise that the recipes it gives are really among the most exciting causes yet discovered in scientific or even what might be called haphazard cuisine; taking no account of the lesser causes, no doubt crediting the gouty with sufficient intelligence to foresee the effect upon the metatarsophalangeal joint of the great toe of the midnight lobster and the after-dinner port. It introduces a certain Dr. Hunter, whom it seems to regard as an authority on gout, and one can almost see a testy little doctor, rotund, red-faced, short-winded, with good living, and knowing his subject from sensation as well as study, as he takes up a famous cookery manual and reads: "Giblet soup, par excellence; veal stock, lemons, yolk of egg, forced meat balls, and Madeira." This, he says, contains a considerable amount of gout and scurvy. Of an unusually rich mock-turtle soup, he says: "A dangerous dish, and will soon bring a man to his crutches." Another of the same he declares most diabolical—only fit for the Sunday dinner of a rustic who is to work the six following days in a ditch bottom; while of a third, mock-turtle soup made with beef, ham, giblets, lemon peel, truffles, eggs, orange juice, forced meat and Madeira—a dish much admired by the patrons of a famous London restaurateur—the doctor says testily: "There is death in the pot."

It has often been observed of those afflicted with gout—the tone of the letters addressed to the society journal in question furnishes still another evidence of it—that they appear more concerned to discovering new remedies to lessen the pain when they shall be again attacked than in adopting a practical means for preventing its recurrence. They try colchicum, soothing topical applications, acetate of potash and other alkalies, and perhaps nitro-muriatic acid, the latter for supplying the oxygen necessary for the conversion of the excess of uric acid from which they are suffering into oxalic acid, and the latter into carbonic acid and urea—always with the hope, so it would seem, of accomplishing by chemistry what regular habits, air and exercise would ordinarily yield.

A CURIOUS CLOCK.

AN ASTRONOMICAL TIMEPIECE MADE FOR KING
HENRY VIII.

The astronomical clock at Hampton Court Palace is the most curious timepiece in England. An old inscription proves it to have been made for Henry VIII. in the year 1540. The designer is not known, but is supposed to be the famous German astronomer, Nicholas Cratzer. The clock was found only about three years ago in a shed, where it had been for half a century, and was restored by the Secretary of the Board of Works. One of the stories about it is that if a resident dies it stops. The dial consists of three copper disks of different sizes, with a common centre, but turning at varying rates. The center disk, the smallest, is 3 feet 3½ inches in diameter. In its center is a projecting globe, painted to represent the earth. The larger part of this disk is divided into four parts, and its outer edge is divided into twenty-four spaces. These represent respectively the quarters of the moon and the hours that it crosses the meridian, and they are indicated by a small red arrow, painted on the second disk, which always points to the quarter in which the moon may happen to be. The second disk is 4 feet 1½ inches in diameter,

but only the outer rim is seen, and that is divided into twenty-nine spaces, numbered from right to left, which represent the moon's age in days. From between the numbers one and twenty-nine is a pointer which marks on the outer disk the time of the day and the night as it passes the twenty-four Roman numerals, two sets of twelve, painted on the stonework, within which it revolves. The third disk, or outer disk, which is 7 feet 10 inches in diameter, has painted on it several sets of concentric circular spaces, first the names of the months, then the days of the months (only twenty-eight for February), next the signs of the zodiac, each zodiacal space being divided into 30 degrees, and on the outside of this disk a circle divided into the 365 days of the year. The weights that are used to run the clock have a drop of 60 feet, and it takes half an hour once a week to wind it. The clock is set in a stone frame about 15 feet square, with the badges of Henry VIII, above the portcullis and *fleur de lis* and the rose and his initials, H. R., below.

NOT THAT KIND.—"I have never met Dr. Littlepil," said the minister, "but I have heard he is quite an athlete—a man of powerful physique, is he not?" "Him," answered the carpenter; "naw! he's a homœopath."—*Brooklyn Eagle*.

WHALE HUNTING.—Hunting whales with steamers and cannon is a new idea. The harpoon is made with four umbrella-like ribs, which is fired from a cannon on the ship into the whale's body. Pressure makes it open up and take a wider and firmer hold, and the whale pulling sets off some nitro-glycerine confined in the cone or front part of the harpoon. With all this the whale sometimes runs for many miles, drawing after it the ship, often at the rate of sixteen knots an hour, and marking its course with blood. Two thousand feet of heavy rope are fastened to the harpoon, but this, as indicated, does not allow sufficient play for this great monster, which is often 70 to 85 feet long, and weighs 100,000 pounds. Afterward, when the whale is dead or nearly so, an iron chain is put around its body, and it is towed into the harbor of the fishing company.

EXPERIMENTS WITH LIGHT.—Dr. O. J. Lodge, a holder of the theory that light is an electrical vibration of the ether, has been endeavoring to produce these waves by direct electric action without the intervention of heat. The means adopted was the oscillating discharge of a Leyden jar, with a rate of vibration as high as 1,000,000 per second. The waves thus obtained were about three yards long, but, according to Dr. Lodge, were light in every particular except wave length. To reach the wave length of light, however, they would require to be shortened from three yards to the hundred thousandth of an inch. The electrical waves of Dr. Lodge travel through space at the same speed as light, and are refracted and absorbed by material substances according to the same laws. Hence Dr. Lodge concludes that if we can only generate electric waves sufficiently small we may entirely revolutionize our present modes of obtaining artificial light.

PAPER IN BUILDING.—The use of paper fabric for building purposes—by the term paper being meant, broadly, a flexible sheet made of vegetable or other fibre, which has been reduced to a pulp, and then pressed out and spread and dried—is now advocated by some builders on the following grounds: First, continuity of surface; that is, it can be made in rolls of almost any width and length, is flexible, or, by glueing several layers together, may be made stiff, and will stop the passage of air because there are no joints. Second, it has no grain, like wood, and will not split. Third, it is not affected by change of temperature, and therefore has an advantage over sheet metal as roofing material. Fourth, whereas in its natural condition it is affected by moisture, it may be rendered waterproof by saturating with asphalt, or by a variety of other methods. Fifth, it is a non-resonant, and well fitted to prevent the passage of sound. Sixth, it is a non-conductor of heat, and can be made also of incombustible material like asbestos, or rendered fire-resisting by chemical treatment. The combination of paper with other substances and solidifying the mass by pressure, renders practicable the production of a material capable of replacing wood for many purposes; and not the least among its characteristics of adaptability is the ease with which it may be made into sheets of any width and thickness, that it will not warp or shrink from heat, cold or dampness.

PREMIUM OFFER.

In order to increase our subscription list more rapidly, we make the following offer to those who shall send us, before July 1, 1889:

SUBSCRIPTIONS AT ONE DOLLAR EACH.

FIFTY DOLLARS IN CASH
for 200 Subscriptions.

TWENTY-FIVE DOLLARS IN CASH
for 125 Subscriptions.

TWENTY DOLLARS IN CASH
for 100 Subscriptions.

FIFTEEN DOLLARS IN CASH
for 75 Subscriptions.

TEN DOLLARS IN CASH
for 50 Subscriptions.

FIVE DOLLARS IN CASH
for 25 Subscriptions.

TWO DOLLARS IN CASH
and the AMERICAN ANALYST free for one year for 10 Subscriptions.

ONE DOLLAR IN CASH
and the AMERICAN ANALYST free for one year for 5 Subscriptions.

DIRECTIONS:

Send in the subscriptions as soon as received by Postal Note, Post Office Money Order or Check, payable to our order. Address your letter to ANALYST PUBLISHING COMPANY, 19 Park Place, New York City, stating that you wish to be entered on the premium list. You will then be credited with each subscription received. Notify us when you have furnished enough subscriptions to entitle you to the premium which you desire to obtain and a check will be mailed to you at once.

BINDERS FOR THE AMERICAN ANALYST.

We have selected the 'Handy Binder' for binding the ANALYST, because of the following advantages: It is elegant in appearance, strong, durable and this new method of binding allows the opening of the pages perfectly flat, owing to the fact that none of the side of the paper is used. This method also permits the taking out and replacing of one or more papers from any part of the file without disturbing the other parts. After the file is completed it ceases to be a temporary binder, and with its contents becomes a perfectly and strongly bound book. Owing to the unusual size and strength of the linen binding cord in combination with two metallic binding strips (loops) the strength and durability of the binding is wholly unequaled by any method yet introduced. Price, sent post-paid, 75 cents. To any subscriber renewing his subscription at \$1 sent directly to this office, we will send one for 25 cents, and we will give one free as a premium for every new subscription sent to us with \$1.

THE TRUE REASON.

WASH DAY MADE EASY

There is reason in everything, but not every reason given is true. About washing clothes, for instance, common sense and the chemistry of every-day life teach us that certain things must be done, while others may be left undone. Clothes must be made clean, sweet, pure and wholesome without either injuring the fabric or the hands of the laundress. If these objects can be attained, it does not matter as to what methods are used, and the soap or soap powder, no matter what it is called that will admit of the most varied methods of use is the handiest. Some things, however, are important to observe. The dirt and all soap must be entirely removed from the interstices of the clothes and all microbes must be destroyed. The only and easiest way to do this is by heating the water in which the clothes are contained to the boiling point. Of course, cold process and rosin soaps, as well as all inferior soaps will

not stand boiling water, consequently their manufacturers will advise against boiling. This is not in the purchasers' interest, but for their own selfish purposes. The boiling water, by constant self-agitation, is forced through the interstices of the fabrics, and thus cleanses them from dirt and disease-breeding microbes, as they can be cleansed in no other way—and without in any manner injuring the fabric. As there is no royal road to learning, neither is there any easier, surer or safer way of washing clothes clean and freeing them from all disease-breeding microbes or bacteria than by using PYLE'S PEARLINE, and to strictly follow the directions accompanying each package. Above all things, avoid any soap or soap powder that do not work to best advantage in hot water.

Subscriptions \$1 per year. Now is the time to subscribe.

BUFFALO LITHIA WATER

In the Uric Acid Diathesis, Bright's Disease, Chronic Inflammation of the Bladder, etc.

JAMES L. CABELL, M. D., A. M., LL. D., Professor of Physiology and Surgery in the Medical Department in the University of Virginia, and President of the National Board of Health.

"The Water of Buffalo Spring No. 2 contains in notable quantities two of the ALKALIES which are accredited as extremely valuable in the treatment of GOUT, LITHIASIS, and Liver Affections. I refer to the CARBONATES of POTASH and LITHIA.

"I have recently read with interest a paper in 'The New York Medical Journal' on the Buffalo Lithia Water in Diseases of the NERVOUS SYSTEM, in which the writer, Dr. Boyland, citing his own observations and those of other eminent physicians, ascribes to this water a special virtue as a direct tonic for the NERVOUS SYSTEM in cases of CEREBRAL exhaustion. I have only had occasion to test its effects in this direction in cases in which the NERVOUS SYMPTOMS may have been due to LITHÆMIC conditions. In these cases the relief following the use of the remedy was very decided."

Dr. WM. A. HAMMOND, of New York, Surgeon-General U. S. Army (retired), Professor of Diseases of the Mind and Nervous System in the University of New York, etc.

"I have for some time made use of the Buffalo Lithia Water in cases of affections of the NERVOUS SYSTEM, complicated with BRIGHT'S DISEASE OF THE KIDNEYS or with a GOUTY DIATHESIS. The results have been eminently satisfactory. Lithia has for many years been a favorite remedy with me in like cases, but the BUFFALO WATER CERTAINLY ACTS BETTER THAN ANY EXTEMPORANEOUS SOLUTION OF THE LITHIA SALTS, and is, moreover, better borne by the Stomach. I also often prescribe it in those cases of CEREBRAL HYPERÆMIA resulting from over-mental work—in which the condition called NERVOUS DYSPEPSIA EXISTS—and generally with marked benefit."

Dr. ROBERT BATTEY, of Georgia, SUGGESTOR OF BATTEY'S OPERATION.

"I would state that I have been using the Buffalo Lithia Water, No. 2, in my practice for three years past, in cases of CHRONIC INFLAMMATION of the BLADDER, whether induced by STONE, by enlarged PROSTATE in the aged or by NEGLECTED GONORRHOEA, AND HAVE SECURED EXCELLENT RESULTS, which encourages me to prescribe it for the future."

HUNTER McGUIRE, M. D., LL. D., late Professor of Surgery, Medical College of Virginia, Richmond.

"BUFFALO LITHIA WATER, Spring No. 2, as an ALKALINE DIURETIC, is invaluable. In URIC ACID GRAVEL, and, indeed, in diseases generally dependent upon a URIC

ACID DIATHESIS, it is a remedy of extraordinary potency. I have prescribed it in cases of RHEUMATIC GOUT, which had resisted the ordinary remedies, with wonderfully good results. I have used it also in my own case, being a great sufferer from this malady, and have derived more benefit from it than from any other remedy."

Dr. WM. B. TOWLES, Professor of Anatomy and Materia Medica in the Medical Department of the University of Virginia.

"BUFFALO LITHIA WATER, No. 2, belongs to the ALKALINE or, perhaps, to the ALKALINE-SALINE Class, for it has proved far more efficacious in many diseased conditions than any of the simple ALKALINE waters.

"I feel no hesitancy whatever in saying that in GOUT, RHEUMATIC GOUT, RHEUMATISM, STONE in the BLADDER, and in all Diseases of URIC ACID DIATHESIS, I know of no remedy at all comparable to it.

"Its effects are marked in causing a disappearance of ALBUMEN from the urine. In a single case of BRIGHT'S DISEASE OF THE KIDNEYS I witnessed decided beneficial results from its use, and from its action in this case I should have great confidence in it as a remedy in certain stages of the disease."

Dr. THOMAS H. BUCKLER, of Paris (formerly of Baltimore), SUGGESTOR OF LITHIA as a Solvent for Uric Acid.

"Nothing I could say would add to the WELL-KNOWN REPUTATION OF THE BUFFALO LITHIA WATER. I HAVE FREQUENTLY USED IT WITH GOOD RESULTS IN URIC ACID DIATHESIS, RHEUMATISM, AND GOUT, and with this object I have ordered it to Europe, from Coleman & Rogers, of Baltimore. Lithia is in no form so valuable as where it exists in the Carbonate (the form in which it is found in the BUFFALO LITHIA WATER), Nature's mode of solution and division in water which has passed through Lepidolite and Spondumine Mineral formation."

Dr. GRAEME M. HAMMOND, of New York, Professor of Diseases of the Mind and Nervous System in the New York Post-Graduate Medical School and Hospital.

"In all cases of BRIGHT'S DISEASE of the KIDNEYS I have found BUFFALO LITHIA WATER of the greatest service in increasing the quantity of urine and in eliminating the ALBUMEN. In certain cases of Melancholia, accompanied by excessive eliminations of URATES and URIC ACID, it is often the only remedy necessary. In GOUT and RHEUMATISM it is highly beneficial, and in many cases of Impotence its restorative qualities have been of undoubted assistance. I have long regarded BUFFALO LITHIA WATER as the most valuable mineral water in use."

Water in cases of one dozen half-gallon bottles, \$5.00 per case at the Springs.

THOMAS F. GOODE, Proprietor, Buffalo Lithia Springs, Virginia.

stands without an equal for all purposes for which soap is used. It is the greatest known economizer of time, drudgery, and wear and tear in washing and cleaning.

MILLIONS of packages of Pearline are consumed annually, by economical, intelligent house-keepers—women who

are quick to embrace modern labor-saving ideas; or, not doing the work themselves, are bright enough to supply their servants with Pearline. They get the best possible results, and have fewer back-aches and complaints. Their clothes and paint wear longer because they are not rubbed to pieces.

Beware of imitations which are being peddled from door to door. First-quality goods do not require such desperate methods to sell them. PEARLINE sells on its merits, and is manufactured only by JAMES PYLE, New York.

HANDY TO AMUSEMENTS AND SHOPPING.

When in New York stop at the Sturtevant House, Broadway, cor. 29th Street; it is finely furnished and the prices are reasonable. You won't regret it. Matthews & Pierson, Props.—*Bulletin*.

Ask Grocers for our Patent Barley **CRYSTALS**, a new, unrivalled Cereal Food, for Breakfast Tea & Dessert. If not sold there, write us for free samples. **GLUTEN FLOUR** and **SPECIAL DIABETIC FOOD** are invaluable waste-repairing flours for **Dyspepsia, Diabetes, Debility & Children's Food**. No bran; mainly free from starch. For all family uses nothing equals our **HEALTH FLOUR**. Send for circular offering 4 lbs. free. **FARWELL & RHINES**, Props., Watertown, N.Y.

LEA & PERRINS' SAUCE.

Lea & Perrins', the original and genuine Worcester-shire Sauce, has been before the public over a half a century. Like all popular favorites it has long been the standard of comparison and the pattern for counterfeiters who not being able to imitate its excellence offer to the public imitations in bottling, labels and style of putting up. They dare not counterfeit the signature of Lea & Perrins which is on the red label of every genuine bottle, and of which this is a facsimile.

Lea & Perrins

To be sure of obtaining the genuine article, see that the above signature is on the label.

LADIES' HOME COMPANION

A PRACTICAL HOUSEHOLD JOURNAL.

Now in its 16th year, well established, tried and true, as attested by a constituency of over Three Hundred Thousand Readers. The publishers, desirous of extending its influence into half a million homes, offer

3 Months Trial

for Only 10 Cents.

10 cents (Silver or Stamps) will secure **SIX NUMBERS** of this charming periodical (all different), each copy equal in size, quality and amount of reading matter, etc., to regular illustrated papers that cost 10 cents a copy or \$4.00 per year.

The **LADIES HOME COMPANION** stands without a peer in literary excellence, typographical beauty, suggestive illustrations and helpful advice for every department of home life. It is beautifully illustrated, and printed on fine, cream-tinted paper, and has a more brilliant array of contributors than ever before, consisting of

8 Regular Editors and Scores of Eminent Writers,

Whose facile pens will furnish **Short and Continued Stories** of absorbing interest, while all branches of household economy that can possibly come within the good housewife's province will be ably treated by experienced editors, and use, beauty and refined entertainment have due attention.

PRACTICAL HOUSEKEEPING. This department is a well-spring of valuable suggestions for every branch of housekeeping, including a large variety of tested recipes, and how to prepare them at the least expense, in dainty and appetizing forms; also, hints for table decorations, methods of work, etc., and much practical information, covering the entire range of household work, treated in such manner as to interest every housekeeper.

FANCY WORK. In these departments elegant illustrations and plain directions are given, showing how to make all kinds of fancy work, embroidery, needlework, crocheting and knitting; also suggestions for ornamenting Parlors, Bedrooms, Dining-rooms; arranging and Decorating Furniture, Curtains, etc., so that homes may be adorned with taste, and made attractive with little or no outlay. Instructions will also be given that will enable any one to make many useful and ornamental articles, such as Wall-pockets, Brackets, Fancy Leather-work, Work-boxes and Baskets, Fancy Work with Leaves, Flowers, Grasses, etc.

FASHIONS, OR, WHAT TO WEAR AND HOW TO MAKE IT. Artistic illustrations are always found in this department, with descriptions of the newest and latest styles and Novelties in Ladies' and Children's Dresses, Hats, Bonnets and other garments, with directions that enable one to dress well and economically. The very finest illustrations are used to make everything plain, so that ladies can make their own dresses, trim their own Hats and Bonnets, and dress themselves and their children with neatness and taste, in the prevailing styles. Each copy of the **Ladies Home Companion** is worth more than a year's subscription to every young lady and married woman, for this department alone.

MOTHERS find the portion devoted to them invaluable, and filled with a wide range of helpful suggestions obtained from practical experience relating to a mother's duties to her children, how they should be reared and cared for in sickness and in health; also suggestions and illustrations for all kinds of children's garments and many other necessary things.

FLOWERS. The Floral Department is a treasure to the amateur florist and all who love flowers, containing much of interest to those who raise flowers, whether for pleasure or profit.

OCCUPATIONS FOR WOMEN. Women can make money in many ways, and the opportunities for women to become self-supporting are constantly increasing. The **Ladies Home Companion** aims to keep women informed in reference to those things that wives, mothers and single women are doing to earn money, while in all its departments it is the most complete, most readable and

Most Fascinating Ladies' Paper Published.

TOILET.—Recipes and hints for care of hands, face, teeth, eyes, hair, etc., color and harmony in dress, etc.

ETIQUETTE at home and abroad, at the table and on the street, at public gatherings, etc.

CHILDREN'S CORNER sparkles with interesting sketches and splendid stories for wide-awake boys and girls, while an opportunity is given to develop their mental powers by solving puzzles, charades, enigmas, etc., for which prizes are offered.

DEPARTMENT.—Rules, usages and ceremonies of good society, letter writing, good manners, the art of conversing well, accomplishments, home training.

SEASONABLE BILLS OF FARE are given, with plain directions for the economical preparation of healthful, nourishing and palatable dishes, with hints for serving, arrangement of table, reception of guests, etc., etc. Also menu for parties, teas, receptions, Thanksgiving and Christmas dinners.

So popular have our publications become that more than a million people read them regularly.

Mention this paper and address **LADIES HOME COMPANION, Philadelphia, Pa.**

FOR THE THIRD TIME

In our history we have been forced to move into larger quarters to keep up with the demand from our New York, Worcester, Springfield, Providence, Lynn, New Haven, and two Boston stores, and our enormous mail trade. We now occupy two-thirds of an acre of space devoted entirely to custom-work, turning out more garments than any house in the United States. You can order by mail by our system as safely as if you could call at one of our stores. To obtain the famous Custom-made Plymouth Rock 33 Pants, first, send 6 cents, for which we will mail you 20 samples self-measurement blanks, and linen tape measure, provided you MENTION THIS PAPER, or if you cannot wait for samples, tell us about the color preferred, with waist, inside leg, and hip measures, remit \$3, together with 35 cts. to cover cost of expressage or postage, and we will forward the goods prepaid to any address in the U. S., guaranteeing safe delivery and entire satisfaction or money refunded. Remember, also, that we make to your order, Full Suits, \$13.25, Overcoats, \$12.00, and that for any cause we refund money at buyer's request upon return of goods, or make alterations or new garments free of extra charge.

PLYMOUTH ROCK PANTS CO.

BRANCH OFFICES.—285 Broadway, New York; Burnside Building, Worcester, Mass.; Gilmore House, Springfield, Mass.; 60 Market St., Lynn, Mass.; Butler's Exchange, Providence, R. I.; Register Building, New Haven, Conn.

Any one wishing to learn of our responsibility, may write the American Express Co., at Boston, (capital \$20,000,000) or consult the commercial agencies.

MALTINE

MALTINE is far superior in nutritive and diastatic value to any Malt Extract manufactured in the World. There is no reconstructive that excels Maltine in Phthisis and many wasting Diseases.

MALTINE in its different forms is the only malt preparation we now employ, being so palatable, digestible, and easily assimilated. Of its efficiency in appropriate cases there is no more doubt in our minds than there is of the curative power of Quinine, Cod Liver Oil, the Bromides, and the Iodides. It deserves to stand in the front rank of reconstructives, and the constructive by their preventive, corrective, and curative power are probably the most widely useful therapeutical agents that we possess.

PROF. L. P. YANDELL.

MALTINE is a valuable food, a food of priceless value at times of emergency. In fact, in very grave gastric cases it is a food which may be often resorted to when at one's wit's end what to do.

J. MILNER FOTHERGILL.

Out of 14 trade samples of Malt Extract examined by Messrs. Dunstan & Dimmock, only three possessed the power of acting on starch. These brands were **MALTINE**, Corby's, Stacey & Co.'s Extract, and Keppler's Malt Extract.

WILLIAM ROBERTS, M.D., F.R.S.

I have subjected "Maltine" and all other leading "Extracts of Malt" to an exact quantitative comparison of their diastatic activity.

The results demonstrate conclusively the far greater diastatic value of Maltine, and enable me to state, without any qualification whatever, that it far exceeds in diastatic power any of the six preparations of Malt which I have examined.

R. H. CRITTENDEN.

Professor of Physiological Chemistry in Yale College.

At the International Health Exhibition held in London, England, the only gold medal and the highest award of merit were given to Maltine by a Jury composed of the best chemists in Europe, and recent analyses made by the most reliable authorities in Europe and America prove conclusively that Maltine—in nutritive and diastatic value—is superior to all other malt preparations now in the market.

NOTE.—Physicians will observe that Maltine, as now prepared, is not so viscid as formerly made, being of a more fluid consistency; and, while retaining the nutritive and diastatic value which has given it precedence over all other Extracts of Malt, it is rendered entirely agreeable to the taste of the most fastidious, and is more easily administered. As now prepared, we positively guarantee that Maltine will not ferment or congeal in any climate or at any season of the year.

COMPLETE LIST OF MALTINE PREPARATIONS.

MALTINE (Plain).	MALTINE with Phosphates, Iron
MALTINE with Alternatives.	Quinine, and Strychnia.
MALTINE with Cod Liver Oil.	MALTINE Ferrated.
MALTINE with Hypophosphites.	MALTO-YERBINE.
MALTINE with Peptones.	MALTO-VIBURNIN.
MALTINE with Pepalin and Pancreatine.	MALTINE with Cascara-Sagrada.

Physicians may obtain Maltine from all druggists in every part of the world. In cases where the physician intends to prescribe Maltine, the word "Maltine" should be written, and not simply the words "Malt Extract," or "Extract of Malt."

Send for Pamphlet giving comparative analyses by 100 of the best Analytical Chemists in this country and Europe.

We will be happy to supply any regular practitioner with eight ounces each of any three Maltine compounds that may be selected from our list, providing he will agree to pay express charges on same.

COLDEN'S
ORIGINAL LABEL:
"Colden's Liebig's Liquid Extract of
Beef and Tonic Invigorator."
LIQUID
BEEF TONIC.

AN INVALUABLE AID IN THE TREATMENT OF
ALL CASES OF DEBILITY.

Established 15 Years. Endorsed by Scores of Physicians.
Essentially Different from all other Beef Tonics.
Beware of Imitations.

COLDEN'S LIQUID BEEF TONIC consists of the Extract of Beef (by Baron Liebig's process), spirit rendered non-injurious to the most delicate stomach by extraction of Fusel oil, soluble Citrate of Iron, Cinchona, Gentian and simple aromatics. An official analysis of this preparation by the eminent chemist ARTHUR HILL HASSALL, M. D., F. R. S., and an endorsement by SIR ERASMUS WILSON, F. R. S., is printed on the label of each bottle.

Its Range of Action Embraces all Cases of Debility.

By the urgent request of several eminent members of the medical profession, I have added to each wineglassful of this preparation two grains of SOLUBLE CITRATE OF IRON, and which is designated on the label as "No. 1," while the same preparation, without Iron, is designated on the label as "No. 2." It acts directly on the sentient gastric nerves, stimulating the follicles to secretion and gives to weakened individuals that first pre-requisite to an improvement, an appetite.

I will, upon application, send a sample bottle of Colden's Liquid Beef Tonic to any physician in regular standing. Please ask your Dispensing Druggist (if he has not already a supply) to order it. In prescribing this preparation physicians should be particular to mention "COLDEN'S" viz: "EXT. CARNIS. FL. COMP. (COLDEN)." It is put up in pint bottles and can be had of Wholesale and Retail Druggists generally throughout the United States.

TO THE VARIOUS STATE LEGISLATURES.

Although the AMERICAN ANALYST is published in New York, its readers are all over the Union, and on behalf of this widespread constituency we respectfully ask a hearing from the legislative bodies of the various States on the bills now before several of them, providing that all cattle intended for food shall be inspected alive at the place where the flesh is offered for sale. We ask you to vote against such a bill on the broad ground that the bill is a misrepresentation in its title as well as its language. It should be entitled "A bill for the protection of a few lazy men who would like to live at the expense of the many industrious citizens by agitating and sowing discontent among the people and creating local monopolies." The bald subterfuge that the bill is for the protection of the public health has been too long exploded by the opinions of the many learned and disinterested scientists who have investigated the matter, and it is an insult to your common sense for us to waste your time by arguing that point. The bill is not in the interest of our farmers, because the competition of the farmer is not from dressed beef, which this bill is really intended to exclude, but from the direct and very serious

competition of live stock cheaply raised in the West, which, in default of a market in Chicago, taken away, as it would be, by the proposed bill, would all be shipped East to ruin the Eastern cattle markets. The bill is not in the interest of the consumer, because it proposes to destroy competition, which has so far amply protected the Eastern consumer against local monopolies both in price and quality. The law is not in the interest of that interstate comity and friendship which has heretofore been maintained to our general advantage, but would inevitably lead to retaliation and a most bitter kind of commercial vendetta. The law further would cut off the butchers in all such parts of each State as by their contiguity to neighboring States derive a large business from those points from that business, which at some seasons is the bulk of their trade. In the absence of any good and sufficient reason for such a law, and owing to the manifest object to create a monopoly, it seems hardly necessary to urge the necessity for defeating this measure, conceived in iniquity and brought forth from the lowest and most unworthy motives—pure selfishness and utter disregard for the public weal.

CONCERNING LARD.

The self-styled butchers' organ of Allegheny, Pa., insists upon a little more information on the subject of lard, and on that pretext seems to have thought it necessary to misrepresent what we have said about dressed beef. We took occasion some time since to correct some misstatements of that sheet regarding dressed beef, and when it found that the facts were against it, resort was had to the old trick of evading the issue by accusing the AMERICAN ANALYST of suppressing information about bogus lard. The facts are very plain and easily understood. Lard, as originally made—the tried out hog's fat made by our grandmothers—was not sufficiently white to meet the supposed requirements of commerce, and would not stand transportation in warm weather or hot climates. To remedy these defects pure lard was bleached by chemical processes, and stearine was added to make it harder. Very soon these originally legitimate manipulations led to various adulterations, and finally some of these lard refiners, with only their profit in view, converted everything that was convertible into grease into lard, and a disgusting substance was the result. This had to be stopped, and the large refiners, finding a demand for clean, wholesome substances, to be known under the name of lard, without any increase in the cost, made a mixture of pure lard, clean cotton-seed oil and stearine, which was sold as refined lard. Every market report showed conclusively that Western steam lard was higher in price than refined lard, and no one with any sense could believe that Western steam lard could be refined without any cheaper addition and sold at a less price, and, so long as the article was clean and wholesome and satisfied the public demand, no one could reasonably find fault. The AMERICAN ANALYST has always maintained that all food products should be sold under their proper name and so

labelled. Every merchant, grocer, and the greater part of the public knew perfectly well what refined lard was, and so no harm was done. But we go further and claim that this new method of handling lard has to a very great extent ended the disgusting practices of small refiners and back-street butchers of putting the debris, scraps, unsaleable pork and refuse generally of their stalls into the lard tank, and selling the product for pure lard. If any more questions of this kind are propounded by our hypercritical cotemporaries, they will be answered with equal candor and promptness, even if the answers should not be quite as palatable as expected.

THE SURVIVAL OF THE UNFITTEST.

The *Sanitary News* of Chicago, in its issue of the 9th instant, discusses briefly a question recently propounded to the medical profession by an English journal, "Do you think the great advance in the healing art is responsible for keeping alive much weak life that will in time affect the whole race injuriously?" The proposition is certainly set before us with the brutal directness characteristic of scientific inquiry, as distinguished from ordinary social problems which are expected to display some approach to humane suggestion. Furthermore, as the paper referred to very correctly says, the question is not a practical one, but relates rather to casuistry than to science. It is repugnant to every principle of ethics. The relief of suffering and the preservation of life, in whatever aspect it presents itself to our sympathies, are the primary dictates of ordinary humanity." "Weak life" is entitled to protection on the same terms as the strongest, and the "healing art" that interests itself keeping it alive would be a murderous trade if it allowed that interest to falter. The proposition of the British journalist is founded on the thoroughly English notion that physical culture should be the highest object of human endeavor. But the enlightened common sense of the present age recognizes and demands something higher of mankind than mere physical culture, in intellectual training which tends to elevate "weak life" to a higher degree in the scale of social value than is attainable by mere muscular superiority. As to the influence on the race, that is a consideration which, except in extreme and abnormal cases, may safely be left to the natural processes of evolution. The duty of society is to give the most absolute protection to every one of its members, giving the preference, in fact, if any distinction is to be made, to those whose "weakness" entitles them to its special consideration. A medical man, or a school of medical men, that should take the opposite view of this subject would be acting in opposition to reason, science and the plainest dictates of humanity. It is not impossible, however, that at some near day some system of pre-matrimonial requirement may be adopted, which will enable the State to interpose its authority for the prevention of the "injurious" tendencies predicated of the "weak life" referred to in the question we have been considering.

PENNSYLVANIA AND PURE FOOD.

A bill for the prevention of adulteration of food has been introduced in the House of Representatives of Pennsylvania. The bill provides for the establishment of a chemical laboratory in all boroughs and cities having Boards of Health. The laboratory is to be conducted under rules formulated by the State Board of Health, and the borough and city boards are to appoint for the enforcement of the act such chemists, inspectors and clerks as are recommended as necessary by the State Board. It is provided that the boroughs and cities shall pay the expenses. No person is to manufacture or sell, or offer for sale, any article of food or drugs adulterated within the meaning of the act. The penalty is to be a fine or imprisonment or both. The bill does not apply to cases in which any ingredient not injurious to health is added to the food or drug because of the necessity of such addition in preparing articles of commerce, and not fraudulently to increase the bulk, weight or measure, or to conceal inferior quality. It is also provided that no person, with the intent of selling in the altered state, without notice, shall abstract from an article of food or drug or any part of it, so as to effect fraudulently or injuriously its quality, substance or nature; nor shall any article so altered be fraudulently sold. Under the penalty mentioned, no person shall fraudulently sell any compound article of food or drugs not composed of the ingredients demanded by the purchaser. The inspectors are required to inspect all breweries, distilleries, bakeries, factories, dairies, stores and markets where food or medicine is prepared or offered for sale, and secure by purchase, if necessary, daily, excepting legal holidays, samples of articles likely to be adulterated. These samples shall be submitted to the chemists for examination and analysis. Violations of the act are to be reported by the Health Boards to the proper prosecuting officers. The Health Boards are directed to act in like manner, upon ascertaining that the complaint of any citizen about food or drugs is well founded. All fines and penalties are to go into the respective city and borough treasuries.

AN ELECTRIFIED MENAGERIE.

The thanks of the scientific community of the country are due to Barnum & Bailey for their generosity last week in putting their great menagerie at the disposal of a party of savants, headed by Drs. A. W. Jackson and F. G. Welch of this city. In view of the approaching substitution of "electriciding" for hanging, the electrical experts have long desired to determine the electric irritability and resistance of the higher animals. Mr. Edison had made a few experiments in the premises at Menlo Park, and the Medico-Legal Society of New York last fall made a brilliant and valuable study of the application of Faradism to dogs of different kinds. These, however, gave very vague and indefinite ideas as to the superior types of mammalia, and threw little or no light upon man. The experiments conducted by Dr. Jackson

BURNETT'S

PERFECTLY
PURE
Standard — Flavoring
HIGHLY
CONCENTRATED
EXTRACTS

and his associates were marked by extreme simplicity on the one hand and the greatest care and skill on the other. The electric force was supplied by an improved Groenbeck battery of 42 Leclanche cells—one of the best and most reliable instruments known. The resistance box was the one now used by all the progressive telephone companies and with an index of 100,000 ohms. Before using, the battery was carefully cleaned and adjusted, the cells refilled, and the action tested and standardized. The resistance box was also tested and supplied with new plungers. In determining the resistance of the animals, different systems were employed according to the species experimented upon. With wet-coated animals, such as the seal, sea lion and hippopotamus, pure copper wires were fastened close around the neck and around the hind flippers or hind legs. With dry-coated animals, such as monkeys, carnivora, elephants and ruminants, copper electrodes, covered with fine wet sponges, were employed. To prevent leakage the wires were suspended on glass when passing through the air, and held in silk handkerchiefs when applied to the animals. The resistance of the various animals was found to be as follows:

Seal (wet).....	No result.
	Ohms.
Seal (dry).....	5,800
Antelopes.....	7,400
Gnu.....	11,000
Eland.....	7,280

Hippopotamus (wet).....	No result.
Sea lion (wet).....	" "

In point of irritability, the least sensitive were the

THE superiority of these Extracts consists in their PERFECT PURITY AND GREAT STRENGTH.

There is no subject which should more engross attention than the purity of the preparations which are used in flavoring the various compounds prepared for the human stomach.

They are not only true to their names, but are prepared from fruits of the best quality, and so highly concentrated that a small quantity only need be used.

JOSEPH BURNETT & CO., Boston, Mass.

gramnivora and the most the anthropoid apes. The carnivora occupied a middle place. A curious incident in the affair was the effect of electricity upon a seal. When experimented upon it was sick and miserable, suffering from what seemed to be rheumatism and bronchitis. Twenty-four hours after it showed every sign of convalescence, and forty-eight hours after it was well and hearty. The case speaks volumes for our electro-therapeutic friends. This brief summary gives a fair idea of the excellent work done by Dr. Jackson and his associates. Considering the risk run in exposing a half-million dollars' worth of animals to the tender mercies of enthusiastic scientists, we think that Barnum & Bailey deserve especial recognition and gratitude.

AN UNREASONING CRITICISM.

We seem to have fallen under the censure of the *Stockgrower*, of Las Vegas, New Mexico, for insisting upon having the Eastern markets supplied with only the best quality of beef. Our contemporary, lacking argument, descends to innuendo, and suggests that our editorial utterances are only a reflection of the influence of our advertising columns. Unluckily for its argument, and, by the way, for ourselves also, the houses which the *Stockgrower* names as thus casting their shadows from our back pages throughout the sheet, do not advertise with us, though it would undoubtedly be to their advantage to do so. We have searched in vain through the advertising pages of our Las Vegas contemporary to find some suggestion of actuating influences there, but perhaps that sheet is trying the reverse experiment—endeavoring to conciliate advertising patronage by frantic editorial utterances. Of the two plans we prefer the one attributed to us.

SUNNY ITALY.

According to a published statement of Professor Ruata, of Perugia, there are annually in Italy nearly 300,000 cases of typhoid fever, of which number 27,000 prove fatal. One-third of the persons in Italy who reach the age of forty-five have the fever, and in some districts more than three per cent. of the population die from this one cause.

LACTOPEPTINE.

The most important remedial agent ever presented to the Profession for Dyspepsia, Vomiting in Pregnancy, Cholera Infantum, Constipation, and all Diseases arising from imperfect nutrition.

Lactopeptine precisely represents in composition the natural digestive juices of the Stomach, Pancreas and Salivary Glands, and will, therefore, readily dissolve all foods necessary to the recuperation of the human organism.

CAUTION

We regret that we are compelled to caution the profession in prescribing Lactopeptine, but very careful investigation has proven to us clearly the necessity of it.

Substitution of cheap and worthless compounds are being made in many cases where Lactopeptine is prescribed.

Lactopeptine is always UNIFORM, and its effects are SPECIFIC, and no one has ever been able to imitate its digestive value. If you do not obtain positive results when you prescribe Lactopeptine, you can be sure that some substitution has been made, and in such cases it may be necessary for the physician to prescribe Lactopeptine in the original ounce package to insure certainty of obtaining the genuine article. We can confidently make this assertion, knowing the scrupulous uniformity in digestive value of every ounce of Lactopeptine.

Lactopeptine has always been kept strictly in the hands of the Medical Profession, never having been admitted in any publications but Medical Journals. It is prescribed by the most intelligent and educated physicians in all parts of the world, and there are but few physicians who have ever used Lactopeptine that will not agree with the late Prof. L. P. Yandell, when he says: "Lactopeptine is one of the certainties in medicine, and in this respect ranks with Quinine."

In the various forms of Dyspepsia, in vomiting in Pregnancy, and in Mal-nutrition of children, there is no known remedy so positive in results.

MEDICAL SUPERSTITIONS.

SOME FRENCH VAGARIES OF THE OLDEN TIMES.

A French writer named Challamel has recently issued a book entitled "A Bird's Eye View of France in the Middle Ages," in which he relates a number of medical superstitions current in France in the middle ages, most of which are said to prevail at the present time also. In those days the French seem to have had unlimited faith in preservatives against diseases and infallible means of cure, and it may be added that they were not alone in their trustfulness. The following are some of the superstitious practices mentioned: To cure fever, they abstained from both flesh and eggs on Easter and on other high festivals; they caused a cabbage stolen for the purpose from a neighboring garden to be dried on a pot-hook; they wore one of a dead man's bones as an amulet; they inclosed a green frog in a bag, and hung it to the sick person's neck; they ate the first Easter daisy that they found; and they received the benediction in three different parishes on the same Sunday. While telling their beads, they searched for a mullein-stalk and threw it to the winds; they passed through the cleft of a tree? they caused a horse to drink a bucketful of water, and then drank after him; they crossed a procession between the cross and the banner; they drank holy water on Easter Eve or on the eve of Pentecost; they twined the hems of a shroud about their arms or neck; and they drank three times of a mixture of water from three wells in a new pot. The people of Province had their fisheries blessed on a certain saint's day. On Assumption Day the people of Perigord went before sunrise, walking backward, to gather nine sprigs of centaury, which they fastened to a feverish person's neck, after which they gave him an infusion of the herb to drink. A toad choked to death on the eve of St. John's Day had the same virtue. It was common for a feverish patient to rise early in the morning and walk backward in a meadow, plucking a handful of herbs without turning or looking at them, then throw them behind him and keep on in his course without turning back; the result of this was that the fever attacked the devil. Another practice was for the fevered person to drop a piece of money in a public place, with some mummary; whoever picked up the coin took the fever. The waters of several fountains cured fevers, and in particular the fountains of Krignac triumphed over tertians. To overcome fear, one had only to stick pins in a dead man's shoe, carry a wolf's tooth or eye about, or ride a bear. To banish rheumatism, the sick person caused a miller or his wife to strike three blows with the hammer, saying: *In nomine Patris*, etc. Bathing the painful parts with the water of the fountain of Monies caused the pain to cease. In Landes, rheumatics and paralytics were

cured of their ills by getting into certain openings, called *etrines*, in the pillars of a church. In Brittany a child was protected against all diseases by having its shirt put on damp. The people of Perigord carefully preserved the ashes and embers of the Yule log, which cured the maladies of both man and beast. In some districts the butter made in May was kept as a vulnerary. Among the peasants of the Montagne-Noire a white-handled knife was an infallible remedy for colic. Epilepsy was cured by attaching a crucifix nail to the patient's arm or by causing him to wear a silver ring or a medal bearing the names Gaspar, Melchior, and Balthasar. For warts there was a very simple specific—rubbing them with a wad of hair or of broom, and wrapping chick-peas or pebbles in a rag, which the person was to throw behind him on a road. Whoever had toothache touched the aching tooth with a dead person's tooth.

THE WEEKLY ANALYST.

WHAT THE PRESS SAYS ABOUT OUR NEW DEPARTURE.

(From the *Hotel Mail*, Feb. 9.)

At this period, when centennial celebrations are especially in vogue, we take pleasure in noticing the one hundredth issue of the *AMERICAN ANALYST*. It has lately changed from a semi-monthly to a weekly but the subscription price remains the same, \$1 a year.

FULFILLING A USEFUL FUNCTION.

(From the *N. Y. Journalist*, Feb. 9.)

The *AMERICAN ANALYST* of this city celebrated its fifth birthday the first of last month by becoming a weekly instead of a semi-monthly publication. The change is much to the advantage of its patrons, both readers and advertisers, especially as the price of subscription remains the same as before. In its efforts to teach the housekeeper the character of foods, pharmaceutical preparations, etc., and the science of domestic economy in general, the *ANALYST* occupies a field peculiarly its own. Household education of this practical kind, is the most useful function of popular science, for human prosperity is largely dependent upon the comforts of the Home. The housewife who desires to become familiar with the inner facts of her department, from the value of the several cuts of beef to the chemistry of bread making, or the science of sweeping a room, will find just what she needs in the *AMERICAN ANALYST*; and we are glad to learn that the new departure above referred to is meeting with a gratifying recognition.

HARMLESS AGITATORS.

THE RETAIL GROCERS VERSUS THE PHILADELPHIA AMATEURS.

The *Merchants' Review* of this city said under date of Feb. 8:

A local daily says: "The National Pure Food Association has met again in annual convention at Washington." The interpretation of the foregoing is simply this: The Amerling crowd that sought to force upon the retail grocery trade a most unjust and impracticable pure food bill and were afterwards severely sat upon by the association, have assumed a title to which they have no right and played a trick upon several unsuspecting newspaper reporters. The National Pure Food Association has nearly a hundred members, but it is doubtful if the Amerling call brought together a half dozen people. When the chairman's and secretary's positions were filled and a sergeant-at-arms appointed, what a sea of faces must have met the modest chairman as he rose to call the convention to order. Whether the affair was instigated in order to throw odium upon the simon-pure association, we do not know, but it has that appearance. The idea that the convention will have the slightest effect on Congressional action is preposterous, but the temporary notoriety enjoyed by those engaged in it will probably more

than recompense them for their failure, while it will act as an antidote for the contempt with which every person interested in the movement must perforce regard them.

The *Merchants' Mail* of Albany of the same date says in reference to the retail grocer's anti-adulteration organization:

The executive committee of the Pure Food Association have held a meeting and decided that all the present officers should serve for another year. It will be seen from this that the *thirty-five* retailers who are members, are not to be given another chance for a "beer garden" scene at Washington, or in the election of officers for the year 1889, to preside over this, the most important movement, that has ever affected the grocery trade (?). The *thirty-five* retailers and the few other members it would seem are to have no part in a movement that is—say in 1880 to go through this country like a dose of salts.

And the *Retail Grocers' Advocate* of Feb. 9 says, after a weak laudation of the ineffective Philadelphia "crusaders."

The Agricultural Department has been hampered in its efforts to carry on its work in the investigation of food adulterations by a lack of funds. This lack of money has been the chief cause of delay in the publication of the results of the Department's work upon lard and imitations thereof. Consequently the House Committee on Agriculture has included in the regular Agricultural Appropriation bill of this year an item appropriating \$5,000 for carrying on the investigations. Last year the city got no special appropriation. The increased liberality of Congress will, it is expected, enable the work to be carried on more vigorously.

SEVERE ON THE CRUSADER.

The *Grocers' Criterion*, referring to the Pure Food Bill approved by the National Pure Food Association, says: "Mr. H. Wharton Amerling does not think that the bill will come up for consideration during the present session, but hopes that it will be considered in the next." It is very kind of Mr. H. W. A. to trouble himself about the matter, but couldn't he give the public some later news, as for instance, that the Dutch have captured Holland. His statement is rather mossy, and besides, are there half a dozen citizens of the United States that care for his opinion on the subject of food adulteration or any other?

PAPER LEATHER.—During the last twelve months, says the *Revue des Cuirs*, a paper leather, to imitate calfskin, has made its appearance and seems likely to play an important part in the manufacture of portfolios and albums. It can be used for a variety of purposes, for toilet articles, bookbinding, etc. Real calf is expensive, but of great durability. This imitation calf is cheap, although it can hardly be expected to wear well.

MELTED IRON AND WATER.—If a ladle of iron is accidentally spilled, it will of course almost inevitably do some damage or injure some one. But the chances for the man getting away from it are fairly good unless water is encountered, when there is immediately such a violent explosion and scattering of hot metal that there is very little chance for the escape of any one without injury. A combination of melted iron and water is as dangerous as gunpowder, and iron-workers should always take pains to prevent such a combination being possible.

GELATINE IN VARNISH.—A varnish made with alcohol will get dull and spongy by the evaporation of the alcohol, which leaves water in the varnish, as all commercial alcohol contains water. It is, therefore, says the *Carraffe Monthly*, advisable to take a thin sheet of gelatine, cut it into strips and put it into the varnish; it will absorb in the thin sheet most of the water, and the varnish can be used clear and bright till the last drop. The gelatine will get quite soft. It can then be taken out and used again.

THE CAPITAL.—The capital of the United States has been located at different times at the following places: At Philadelphia from Sept. 5, 1774, until Dec., 1776; at Baltimore from Dec. 20, 1776, to March, 1777; at Philadelphia, from March 4, 1777, to Sept., 1877; at Lancaster, Pa., from Sept. 27, 1777, to Sept. 30, 1777; at York, Pa., from Sept. 30, 1777, to July, 1778; at Philadelphia, from July 2, 1778, to June 30, 1783; at Princeton, N. J., June 30, 1783, to Nov. 20, 1783; Annapolis, Md., Nov. 26, 1783, to Nov. 30, 1784; Trenton from Nov., 1784, to Jan., 1785; New York from Jan. 11, 1785, to 1790; then the seat of government was removed to Philadelphia where it remained until 1800, since which time it has been at Washington.

THE SUPPRESSION OF GOOD BEEF.

THE EASTERN PRESS CONDEMNNS THE EFFORT TO EXCLUDE WESTERN BEEF.

(From the *New York Times*, February 12.)

A THIN PRETEXT.

The Butchers' bill for the suppression of the dressed beef trade has been rejected by the Ohio Senate and the Pennsylvania House of Representatives, although eighty members of the last named body voted for it. But it appears that ten States and Territories have responded to a resolution of the Kansas legislature relating to the holding of a convention for the adoption of a bill that shall be supported simultaneously in several legislatures for the overthrow of the combination of slaughterers and shippers in Chicago and Kansas City. It seems to us that the opponents of these slaughterers and shippers should first procure by proper authority proof that there is such a combination. There have been and are now indications that a combination exists, but the proof should be obtained by a Congressional committee. The committee appointed last year to make an inquiry does not seem to have covered the ground. And if it should appear beyond question that a combination exists, it would be foolish to proceed against it by means of an inspection bill designed to prevent the moving of beef across State lines and put forward on the thin pretext that dressed beef is diseased.

(From the *New York Herald*, February 14.)

LIVE AND DEAD BEEF.

NEW YORK, Feb. 12, 1889.

To the Editor of the *Herald*:

As a butcher doing a large business, as well in New York as in the surrounding parts of New Jersey and Connecticut, I desire to express to you my heartfelt thanks for your very *apropos* editorial entitled "Don't Reduce Competition by Law" in this morning's *Herald*. As usual, the *Herald* takes the common sense view of the subject. Allow me, however, to call your attention to two important facts bearing on the subject. The first is that neither the State of New York, New Jersey nor Connecticut can raise enough beef to supply the legitimate demand in those States, and to the farmers in those States it may be said that their danger of competition is not from dressed beef, but from live beef.

The second fact is that a State inspection law passed in New York will not be alone, but will be quickly followed by similar laws in New Jersey and Connecticut, and then what is to become of New York butchers' trade in Connecticut and New Jersey? That knife cuts both ways.

Please, Mr. Editor, save us from such an iniquitous law.

Very respectfully yours,

CLEAVER.

(From the *Albany Merchants' Mail*, February 15.)

THE NEW YORK BILL DENOUNCED.

Ninety per cent. of the butchers to-day sell what is called Chicago dressed beef, and their reasons for so doing, it strikes us, are quite logical. In every city of any size there are agencies for Western dressed beef, and the local butcher can order every day about the quantity he thinks he will need. In this way he saves a considerable sum of money, especially in the summer time, in his ice bill, as he has but little to carry over from day to day. In case his supply for the day's business runs short, in this age of telephones it is only a few moments before he can have a fresh supply upon his counter. As to the wholesomeness of what is called Chicago dressed beef and home dressed, many eminent physicians have declared that beef killed several days is much healthier than that fresh killed. There was a time when there was no such thing as Chicago dressed beef, and our local butchers know what West Albany was then. They were under the control of as grasping a monopoly as ever existed. A blockade or severe snowstorm, or accident, and the ring would

get together, and up went the price of beef. If complaints were made, as was often done, the reply was invariably: What are you going to do about it? Cattle thoroughly starved out and famishing for water after having been on the road days and days, would arrive here and were driven direct to the slaughter house. There was no settled price in those days for meat, as all depended upon the West Albany ring. Since Chicago dressed beef made its appearance, it has acted as a leveler in keeping the price of home dressed beef down, and we believe we do not err when we say that the price has never reached the old-time prices as when the West Albany ring held sway. Prohibit Chicago dressed beef from coming into this State, and we will return to the days of a worse monopoly than the Chicago men have now. It will mean to the poor as well as the rich, higher prices, and we are inclined to believe no better quality of meat than is now being served. Doubtless there are some evils connected with the Chicago dressed beef that could be remedied without prohibiting its sale, and we believe the promoters of this bill are counting without their host when they count upon the retail trade coming to our legislature to ask the passage of such a bill as is contemplated.

WAVE MOTOR.

A NATURAL FORCE PUMP THAT LIFTS WATER 500 FEET.

Many a visitor to the Cliff House has wondered what the spidery-looking contrivance is for that they have seen a few hundred yards up the beach at Point Lobos. If they will go up to it now and make inquiries, for it is at last in working order, they will find that it is a machine for turning the rhythmical beating of the waves against the rocks into power that can be utilized for working mills and manufactories, and driving cable cars and putting salt water baths into city houses and sprinkling the streets and flushing the sewers. Though the result of supplying a power that can take the place of high-priced coal is so important the machinery by which it is accomplished is simple enough. One wonders as soon as he sees it why somebody didn't think of it ages ago. All that there is of it is a sort of developed suction pump, in which the power is supplied by the waves, a reservoir and water-wheels suspended from big iron uprights is a framework, across the lower part of which is fastened heavy planking. This planking presents a face to the waves about six feet by twelve, and its framework is so arranged that it can be raised or lowered as the tide rises and falls. The waves dashing against this move it in iron grooves backward and forward, and its motion is communicated through some other machinery to a twelve-inch piston, so that a movement of thirty-two feet by the framework causes a nine-foot movement of the piston. This pump connects with a long suction pipe, the other end of which is under water. This pipe is fitted with a screen to keep out sand and debris. An air chamber, fourteen feet high, keeps the pressure in the pump steady, and forces a constant stream of water through the big iron pipe that clambers up the cliff and over a hill to a height of 150 feet. This is as high as the pipe goes now, but the force is sufficient to pump the water a height of 500 feet above the sea level. The remainder of the plan is a huge reservoir at that height and a system of water-wheels, which would supply power limited only by the number of motors in use. After the water has passed over the water-wheels, it is the idea of the company that it could be brought into the city and used for private baths, street sprinkling, sewer flushing and other things. At present the motor only is completed, and the water pumped up is allowed to run off in the ground. Only one piston has been put in as yet, but this pumps at the rate of three barrels per minute, and the motor could drive also four others of equal capacity. The force, of course, increases as the tide rises and as the wind sets in toward the land. Ordinarily the motor does not work at low tide, but will run usually from

eighteen to twenty hours per day, and, under favoring conditions of wind and tide, will work steadily the whole twenty-four. The motor was begun three years ago, but unfortunate circumstances have delayed its completion. Severe storms have several times thrown the work back, and when the dynamite-loaded schooner exploded off Point Lobos the rock on which it was being built was split in two. It has only just been completed, but so far has worked with success.—*San Francisco Examiner*.

"THE HOME SEEKER."

A TRUSTWORTHY GUIDE FOR THE POOR MAN SEEKING TO OWN A HOME.

One of the most noteworthy movements of the present period is the rapid growth of building associations, through whose beneficent agency persons of moderate means are enabled to purchase and own homes for their families. In this city these associations have increased in number from only three or four a year ago to forty-one, while Brooklyn has twenty-four and Jersey City twenty-eight. The joint membership of the home-getters in these three sister cities is considerably over thirty thousand, and the money accumulated in small weekly assessments for the purchase of homes is upwards of \$60,000 a week. So large an interest sustained by such an extensive membership, and representing such a rapid accumulation of capital, challenges thoughtful consideration as a potent factor in the social progress of the metropolis. It is with real satisfaction, therefore, that we welcome the advent of a new journal bearing the title at the head of this article, whose special function is to represent the interests of this great home-making enterprise. The *Home Seeker* enters upon existence as the accredited official organ of the building-loan associations of the metropolitan district. The best assurance of the intelligent manner in which their affairs will be discussed is afforded by the fact that its editorial management is conducted by Mr. Chas. O'C. Hennessy, President of the *Daily News* Building and Loan Association, Secretary of the New York State League, and recognized as one of the best informed students of this special subject in this community. The subjoined extract from his salutatory editorial will give a fair idea of the scope of the new journal, whose bi-monthly appearance will be pleasantly greeted by thousands of heads of families and seekers of independent homes:

"We're here to help along and to speak for the building association movement, believing that its possibilities, great as they seem now, haven't yet begun to dawn upon the popular mind. The great metropolitan newspapers haven't yet awakened to the fact that there is a force at work around them that is creating home-owners at the rate of a thousand a year. We say the possibilities of this movement are not realized, for the surroundings of New York City are such as to make it probable that it will yet become the metropolis of the world. And building associations will be the agencies to make it such. A glance at the map printed on another page will show the possibilities of development toward the suburbs. Cheap homes may not be had in the big city, where the pressure of population makes land values high, but cheap homes can be had in the suburbs of Jersey, Westchester, Staten Island and Long Island. A wonderful system of quick travel by rail and water has solved the problems of time and distance, and the man of poor or moderate means may live out of town as conveniently to his business as if he lived in Harlem. The *Home Seeker* will be not only a purveyor of the latest facts, figures and fancies of interest to building association members, but it will endeavor to be in fact as well as in name, an honest seeker of homes, and a bulletin of the best offers that people who have homes to sell may make from time to time. It can be depended upon, also, to deal unsparingly with wild-cat schemes to foist worthless property upon the building association market."

BLOBSON—You seem to have a very bad cold?
Cumpsey—Yes. Blobson—What are you doing for it?
Cumpsey—Coughing.

DOMESTIC DIETETICS.

SPECIALLY PREPARED, FROM PRACTICAL TESTS, FOR THE LADY READERS OF THE "AMERICAN ANALYST."

SEASONABLE FOOD.

February.

MEATS.—Beef, mutton, ham, kidneys, liver, venison, sausage, pork.

GAME AND POULTRY.—Grouse, hare, pigeon, chicken, duck, turkey, goose.

FISH.—Bass, cod, crabs, eels, carp, catfish, flounder, halibut, herring, lobster, mackerel, mussels, oysters, perch, pike, rock-fish, salmon, smelt, whitefish.

VEGETABLES.—Artichokes, beets, beans, cabbage, carrots, celery, garlic, lettuce, onions, parsley, parsnips, potatoes, shallots, spinach, tomatoes, turnips.

FRUIT.—Apples, bananas, grapes, oranges.

PRACTICAL RECIPES.

STEWED OYSTERS.—One quart of oysters, one pint of milk; butter, salt, pepper. Rinse the oysters; drain them. Melt a heaping tablespoonful of butter in a saucepan, add the milk, and, when it comes to a boil, put in the oysters. Cook only until the edges curl, then remove from fire and season. Serve with toast or crackers.

ROASTED SALMON.—Chose a fine large salmon; take a large piece from the middle, dredge well with flour and baste it with butter while roasting. Serve with slices of lemon.

LOBSTER CROQUETTES.—Mince the flesh of a lobster, season with salt, spices and a little cayenne. Melt a piece of butter in a saucepan, mix with it a tablespoonful of flour, then the lobster and some chopped parsley; moisten with a little stock, until the mixture looks like minced veal; then stir into it off the fire a couple of yolks of eggs, and put it by to get cold. When nearly so, shape it into the form of corks, egg them, and roll them in baked bread crumbs. After the lapse of an hour, egg and bread-crumbs them again, taking care to preserve the shape. After a little time, fry them a nice color in hot lard.

HOARHOUND CANDY.—Boil two ounces of dried hoarhound in a pint and a half of water for about half an hour; strain and add three and a half pounds of brown sugar; boil over a hot fire until sufficiently hard; pour out in flat, well greased tins and mark into sticks or small squares with a knife as soon as cool enough to retain its shape.

ORANGE CAKE.—Two cupfuls of sugar and half a cupful of butter stirred to a cream; one cupful of sweet milk, three eggs well beaten, three cupfuls of flour, with two teaspoonfuls of Horsford's baking powder. Bake in sheets.

FROSTING.—Whites of two eggs; make a frosting as for other cakes; save out enough to frost the top of the cake; add to the rest the juice and grated rind of a large orange and half the juice of one lemon spread between the layers.

COLD BUTTER SAUCE.—Butter, half a cupful; sugar, two cupfuls; two eggs, flavoring. Beat all together, and flavor with lemon or orange, or spice, to taste.

BROILED POTATOES.—Parboil the potatoes without peeling; let them cool; peel, cut in thick slices and broil on a wire gridiron till they are brown on both sides. Season with pepper and salt and melted butter. Serve very hot.

Subscriptions \$1 per year. Now is the time to subscribe.

THE DEADLY CIGARETTE.

SOME MORE RESULTS OF CIGARETTE SMOKING.

The following despatches to the daily papers of a single date, tell their own story without need of comment:

Carlisle, Pa. Feb. 11.—Edward D. Crall, business manager of the *Morning Call*, at Harrisburg, died last evening at his father's house on South Pitt street, of blood-poisoning caused by excessive smoking of cigarettes. He was in his twenty-third year.

Middletown, N. Y., Feb. 11.—Johnnie Powers, eleven years old, was taken to the County Asylum at Orange Farm to-day a raving maniac, from the effects of excessive cigarette-smoking. Symptoms of mania first developed Saturday, and were of a spasmodic nature. Soon the boy became very violent, striking at people, tearing his clothes and trying to injure himself. The doctors think the case hopeless.

EARLY FRUIT.—The first hot-house strawberries reached New York December 20 and sold for 50 cents each.

A NEW SCREW.—A screw which is half nail is a new invention. Its holding power in white pine, they say, is 333 pounds, against the 298 pounds of the present screw.

WAGES IN JAPAN.—In Japan the wages of carpenters are from 30 to 45 cents a day; wood carvers, 35 to 53 cents; paper hangers, 23 to 45 cents; stone cutters, 45 to 53 cents; blacksmiths, 23 to 38 cents; gardeners, 19 to 38 cents; day laborers, 15 to 23 cents. The working man pays 40 cents per month rent for a house of one room, \$2.25 month for food, and \$3.75 year for clothes.

DEFINITIONS.—Little Bub (at dinner)—Pop, what does "faith, hope, trust" mean?

Pop—Your ma bought this pie at the baker's on "trust." Can you understand that?

"Yes, indeed."

"I hope there'll be enough to go around. Understand that?"

"O, yes."

"Well, we'll need faith to enjoy it. It's mince."—*New York Weekly*.

ORANGES IN BULK.—Oranges are now being moved from Florida in bulk, the same as potatoes. They are piled about three feet high and paper is run around the sides of the car, while the floor is covered with fine marsh grass. Numerous carloads of the fruit thus packed have reached Baltimore. The *Sun* reports that several varieties came in a car, partitions of thin board being put up. The last car to Baltimore contained 42,000 oranges, and had been six days making the trip. The freight on the car was \$155.

AIR IN EXPLOSION.—Since the recent explosion of a petroleum vessel in Calais Harbor, experiments have been made to determine what proportion of air must be present to form an explosive mixture. With 1 of petroleum vapor to 5 of air no explosion occurs, but when the air is to vapor as 6 to 1, the mixture is feebly explosive and becomes violently so when there is 1 part of petroleum vapor to from 7 to 9 of air. With 12 parts of air it still explodes violently, but with 16 parts it is but feebly explosive, and with 20 parts of air will not usually explode at all.

TO PREVENT CORROSION IN BOILERS.—An English electrician has invented a material, which he calls *alterion*, for the prevention of corrosion in boilers. The interior is coated with this, and currents of electricity are passed through the boiler and from time to time reversed. The formation of the scale is prevented by a layer of hydrogen gas, which is deposited upon the inner surface of the boiler. The reversed currents re-form the hydrogen into pure water, a thin layer of pure water being thus kept all around the boiler.

ELECTRIC LIGHTING OF STAGES.—Electricity is being applied with some success to the lighting of omnibuses in London. The accumulators are placed in a small box beneath the body of the vehicle. The lamp stands in a frame, and is so arranged that, by being moved a little

towards right or left, it is lighted or extinguished. The frame is connected with the accumulator by a small hidden wire. One charge of the battery is sufficient for two days. The invention is in practical use on some of the London omnibus lines, and it is said to work excellently.

COTTON STATISTICS.—The number of cotton spindles in England during 1887 was 42,740,000; in the rest of Europe 23,180,000; in America 13,500,000; in India 2,240,000; making a total of 81,840,000. The quantity of cotton consumed in England was 1,514,521,000 pounds weight; in the rest of Europe 1,459,119,000 pounds; in America 944,758,000 pounds; in India 300,000,000. It will be seen by these figures that England has more than half the spindles in the world and uses more than half the cotton worked by them.

A GREAT EMPIRE.—The Queen of Great Britain is now sovereign over a continent, 100 peninsulas, 500 promontories, 1,000 lakes, 2,000 rivers and 10,000 islands. She waves her hand and 900,000 warriors march to battle to conquer or die. She bends her head and at the signal 1,000 ships of war and 100,000 sailors perform her bidding on the ocean. She walks upon the earth and 300,000,000 human beings feel the least pressure of her foot. The Assyrian Empire was not so populous. The Persian Empire was not so powerful. The Carthaginian Empire was not so much dreaded. The Spanish Empire was not so widely diffused. The Roman power was weak in comparison, and Greece was as a small village.

A VALUABLE EXPLOSIVE.—The new German explosive prepared by Schoeneweg, in its property of flamelessness when exploded, is claimed to be of special value as a substitute for ordinary blasting powder and other explosives in fiery coal mines. It consists of nitrated hydro-carbons mixed with an oxidizing agent, such as chlorate of potash and some organic salt, which renders the mixture flameless. The substance is not hygroscopic, is of a bright yellow color, and can be kept for any length of time without undergoing any change, nor can it be exploded by a flame or a hot substance, but only by a detonating cap. Various experiments made with this compound appear to prove that it possesses the valuable advantages claimed for it by the inventor, and that it is a great acquisition in those mines where an explosive of this nature will insure safety. Its power is found to be equal to that of No. 1 dynamite, while the cost of manufacturing the new substance is less than the latter.

ON SARSAPARILLA.

Sarsaparilla has been known from time immemorial. Long before Cortez and Pizarro invaded the lands of the Aztecs and Incas, it was a standard remedy for every disease. The doctors and medicine men of those races used it in every form. A tea made from the roots and leaves was employed as a febrifuge and mild aperient; a poultice made from its pounded fibres was used for wounds, abrasions, bruises, tumors and ulcers; a stew of all the parts of the herb was utilized for every blood disease. The *conquistadores* possessed great intelligence, and speedily saw the value of the medicine which their enemies employed. Frey Ildefonso was one of the first to appreciate the value of the wonderful herb and sent a large quantity back to Spain, where it was used by the monks and physicians. The success it achieved in Spain made it famous throughout Europe, so that in 1555 A. D. it commanded about a dollar an ounce in Paris, Rome and Naples. From that time until to-day sarsaparilla has never lost its popularity. In 1850, as chemistry began its explorations in the organic world, sarsaparilla became one of the first subjects of scientific study. The savants then ascertained that the virtue of the herb lay in a principle which they termed *sarsaparillin*; that this delicate alkaloid was very unstable, decomposing and disappearing when the roots were exposed too long a time to the open air or submitted to too high a temperature; that the alkaloid was at a maximum when the herb just reached its full maturity and grew less and less hereafter, and that the fresh rootlets were of little or no value. These discoveries were published broadcast, and enabled the pharmacists of the world to improve their preparations to a remarkable extent and the physicians to obtain results long desired, but never before achieved. Among

the first to perceive the value of these experiments was Dr. J. C. Ayer, of Lowell, Mass., who immediately set to work utilizing the same. Not content with what had been done, he started a series of experiments on his own behalf, in which he demonstrated that the maximum benefit of sarsaparilla was only had by combining it with yellow dock, podophyllin, the double iodides, and other invaluable drugs. The result of his work was the making of Ayer's Sarsaparilla, which, at the outset, was adopted by the medical faculty as a standard remedy, and which has held that place ever since. It is difficult to express the good wrought by this famous preparation. There is not a disease occasioned by bad blood, by impurities and humors caused by sickness, heredity or environment, and by contagion or infection, but what Ayer's Sarsaparilla has been employed to produce relief and effect a cure. So great has been its success in this regard that hundreds of manufacturers have endeavored to produce an imitation of the compound. Some have run along a few months and others a few years, but most of them have disappeared from the commercial and medical worlds. The reason of this failure lies in the fact that they were unable to produce a preparation of equal merit. They may have used the same medications in their preparations, but did not apply the same processes in the manufacture of their goods. As a result, necessary and unavoidable, they turned out a sarsaparilla which was not uniform, stable or trustworthy. No physicians could order such preparations, no invalid could use them to relieve himself of disease, and no father could apply them to his ailing offspring. In the meantime, Ayer's Sarsaparilla kept on ever improving. It utilized the new process of percolation, extraction and double reaction, and produced a compound which was perfect from both a medical and chemical standpoint. To-day it enjoys the respect and confidence of the faculty from its purity and certainty, and is adopted into the *materia medica* of the civilized globe. It is, as it has been from the beginning of its career, the best sarsaparilla in the markets of the world.

PREMIUM OFFER.

In order to increase our subscription list more rapidly, we make the following offer to those who shall send us, before July 1, 1889:

SUBSCRIPTIONS AT ONE DOLLAR EACH.

FIFTY DOLLARS IN CASH

for 200 Subscriptions.

TWENTY-FIVE DOLLARS IN CASH

for 125 Subscriptions.

TWENTY DOLLARS IN CASH

for 100 Subscriptions.

FIFTEEN DOLLARS IN CASH

for 75 Subscriptions.

TEN DOLLARS IN CASH

for 50 Subscriptions.

FIVE DOLLARS IN CASH

for 25 Subscriptions.

TWO DOLLARS IN CASH

and the *AMERICAN ANALYST* free for one year for 10 Subscriptions.

ONE DOLLAR IN CASH

and the *AMERICAN ANALYST* free for one year for 5 Subscriptions.

DIRECTIONS:

Send in the subscriptions as soon as received by Postal Note, Post Office Money Order or Check, payable to our order. Address your letter to *ANALYST PUBLISHING COMPANY*, 19 Park Place, New York City, stating that you wish to be entered on the premium list. You will then be credited with each subscription received. Notify us when you have furnished enough subscriptions to entitle you to the premium which you desire to obtain and a check will be mailed to you at once.

BINDERS FOR THE AMERICAN ANALYST.

We have selected the "Handy Binder" for binding the *ANALYST*, because of the following advantages: It is elegant in appearance, strong, durable and this new method of binding allows the opening of the pages perfectly flat, owing to the fact that none of the side of the paper is used. This method also permits the taking out and replacing of one or more papers from any part of the file without disturbing the other parts. After the file is completed it ceases to be a temporary binder, and with its contents becomes a perfectly and strongly bound book. Owing to the unusual size and strength of the linen binding cord in combination with two metallic binding strips (loops) the strength and durability of the binding is wholly unequaled by any method yet introduced. Price, sent post-paid, 75 cents. To any subscriber renewing his subscription at \$1 sent directly to this office, we will send one for 25 cents, and we will give one free as a premium for every new subscription sent to us with \$1.

BUSINESS NOTES.

HORSFORD'S ACID PHOSPHATE,

AS A TONIC.

Dr. John Gerdine, Athens, Ga., says: "In dyspepsia, accompanied with prostration from overwork, I think it is a fine tonic."

A GOOD RULE.

Never begin your correspondence with "I," but in whatever way you commence a letter be sure it is written with one of Esterbrook's popular steel pens.

LOOK OUT for Imitations and Substitutes OF *Horsford's* ACID PHOSPHATE.

A variety of imitations and substitutes of this standard preparation have appeared under the name "Acid Phosphate," or a similar title, all of which differ materially from the genuine article.

Be sure the name "**HORSFORD'S**" is on the label. No other genuine.

A BUSINESS BENEFIT.

ADVANTAGES TO ADVERTISERS OFFERED
BY THE AMERICAN ANALYST.

It has not the limitations of a daily paper. No one reads yesterday's paper. A monthly lives at least a month, while a semi-monthly is fresh twice a month, and its audience is not limited by geographical lines, but the circulation is all over the United States and Canada.

It contains matters of interest to everyone, especially the ladies of the household, and is, therefore, sure of a careful perusal. Our audiences are intelligent and of the better classes, who have money to spend, and any well worded advertisement in our columns, giving real information, will receive a careful perusal.

Our rates are as low as our circulation affords. Large circulation and original matter cost money, and those advertisers who desire to realize these benefits must expect to pay reasonably for them.

Advertisements in our columns are permanent. Most of our subscribers bind their numbers.

Our advertisements are set up in an attractive form, sure to call the attention of the reader.

Anything that our readers want, or for which a demand is to be created, not wholly of a local nature, will pay to advertise with us.

We take only advertisements from legitimate houses of really meritorious goods, and give them all the editorial assistance they deserve; consequently our readers knowing this, have confidence in advertisements contained in our columns.

The fact that we have the best and largest houses in every branch of trade advertising with us, and that they always renew as their seasons arrive, proves beyond a doubt that they have found the AMERICAN ANALYST a good advertising medium. Why should not you?

THE TORSION**Braided Wire Mattress.**

At all times a thoroughly ventilated and perfectly clean mattress, it cannot absorb odors, or retain exhalations or disease germs.

D. HAYES AGNEW, M. D., Prof. of Surgery, University of Pennsylvania, says:

"The Torsion Braided Wire Pillow and Mattress I regard as superior to anything of the kind now in use; well suited for either private or hospital use."

Prof. WM. H. PANCOAST, late Professor of Anatomy, etc., in Jefferson Medical College, now Professor of Anatomy and Clinical Surgery in the Medico-Chirurgical College of Philadelphia Hospital Surgeons, says:

"I have used in my surgical practice your Braided Wire, in the form of mattresses, pillows for the head and body, and short pillows for the arm and leg when injured. I find them most admirable, cool and light, yet affording perfect and elastic support."

I have saved a patient from bed sores by the use of the Braided Wire mattress."

WM. H. FORD, President Board of Health, Philadelphia, says:

"I have used the Torsion Braided Wire Mattress with great satisfaction, it is light and therefore easily handled; it is elastic and very comfortable. The case can be easily removed to afford a complete airing, a feature of great importance from a health point of view. It is an invention of great usefulness."

GOOD ADVERTISING AGENT WANTED

ON LIBERAL TERMS, FOR A MEDICAL MONTHLY, ALSO FOR THIS JOURNAL,

ADDRESS, *Analyst Publishing Co.,*

19 Park Place, New York.

LADIES' HOME COMPANION

Now in its 16th year, well established, tried and true, as attested by a constituency of over Three Hundred Thousand Readers. The publishers, desirous of extending its influence into half a million homes, offer

3 Months Trial
for **Only 10 Cents** (Silver or Stamps.)

10 cents will secure 6 NUMBERS of this charming periodical (all different), each copy equal in size, quality, amount of reading matter, etc., to other illustrated papers that cost 10 cents a copy or \$4.00 a year.

The LADIES HOME COMPANION stands without a peer in literary excellence, typographical beauty, suggestive illustrations and helpful advice for every department of home life. It is beautifully illustrated, and printed on fine, cream-tinted paper, and has a more brilliant array of contributors than ever before, consisting of

8 Regular Editors and Scores of Eminent Writers,

Whose facile pens will furnish **Short and Continued Stories** of absorbing interest, while all branches of household economy that can possibly come within the good housewife's province will be ably treated.

PRACTICAL HOUSEKEEPING. This department is a well-spring of valuable suggestions for every branch of housekeeping, including a large variety of tested recipes, and how to prepare them at the least expense, in dainty and appetizing forms; also, hints for table decorations, methods of work, etc., and much practical information, covering the entire range of household work, treated in such manner as to interest every housekeeper.

FANCY WORK DECORATIONS. In these departments elegant illustrations and plain directions are given, showing how to make all kinds of fancy work, embroideries, needlework, crocheting and knitting; also suggestions for ornamenting Parlors, Bedrooms, Dining-rooms; arranging and Decorating Furniture, Curtains, etc., so that homes may be adorned with taste, and made attractive with little or no outlay. Instructions will also be given that will enable any one to make many useful and ornamental articles, such as Wall-pockets, Brackets, Fancy Leather-work, Work-boxes as Wall-pockets, Brackets, Fancy Work with Leaves, Flowers, Grasses, etc.

FASHIONS, OR, WHAT TO WEAR AND HOW TO MAKE IT. Artistic illustrations are always found in this department, with descriptions of the newest and latest Styles and Novelties in Ladies' and Children's Dresses, Hats, Bonnets and other garments, with directions that enable one to dress well and economically. The very finest illustrations are used to make everything plain, so that ladies can make their own dresses, trim their own Hats and Bonnets, and dress themselves and their children with neatness and taste, in the prevailing styles. Each copy of the Ladies Home Companion is worth more than a year's subscription to every young lady and married woman, for this department alone.

MOTHERS find the portion devoted to them invaluable, and filled with a wide range of helpful suggestions obtained from practical experience relating to a mother's duties to her children, how they should be reared and cared for in sickness and in health; also suggestions and illustrations for all kinds of children's garments and many other necessary things.

FLOWERS. The Floral Department is a treasure to the amateur florist and all who love flowers, containing much of interest to those who raise flowers, whether for pleasure or profit.

OCCUPATIONS FOR WOMEN.

Women can make money in many ways, and the opportunities for women to become self-supporting are constantly increasing. The Ladies Home Companion aims to keep women informed in reference to those things that wives, mothers and

single women are doing to earn money, while in all its departments it is the most complete, most readable and

MOST FASCINATING LADIES' PAPER PUBLISHED.

So popular have our publications become that more than a million people read them regularly.

Mention this paper and address **LADIES HOME COMPANION, Philadelphia, Pa.**

FEMALE DISORDERS.

Employed in the leading Hospitals, and prescribed daily by the most eminent Gynecologists. *Five Thousand Physicians* have given their testimonials for **HAYDEN'S VIBURNUM COMPOUND**.

DISPENSED BY ALL APOTHECARIES.

OPIUM AND LIQUOR HABIT CURED.

WE solicit an investigation of our system and methods, and will gladly send to any one very interesting matter on the OPIUM HABIT DRUNKENNESS and their effects and cure. Physicians specially invited to examine, and if desirous of trying our remedies, liberal arrangements will be made with them.

THE LESLIE E. KEELEY CO., Dwight, Illinois.

is the most reliable substitute known for mother's milk. Its superiority rests on the test of 30 years use in Great Britain and the U. S. A sustaining, strengthening diet for Invalids; nutritious, easily digested, and acceptable to the most delicate stomach. Four sizes, 35c. up. Pamphlet, "Healthful Hints," sent free. WOOLRICH & CO., Palmer, Mass.

A NEW USE FOR LIQUID PEPTONOIDS.

Successfully used in Dissolving the False Membrane in Diphtheria.

A Physician writes: "In an experience of over thirty years I have never used anything to equal your **LIQUID PEPTONOIDS** as a local application with a spray. It will dissolve the membrane and destroy the diphtheretic odor in less than twenty-four hours. I use the **LIQUID PEPTONOIDS** full strength, as a spray, two or three times a day, in bad cases."

Used successfully by another physician in two desperate cases:—"I was induced to try **LIQUID PEPTONOIDS** in two very desperate cases of **DIPHTHERIA**. I think I never saw throats more heavily coated with exudate than were these, and I think I never saw it more rapidly disappear than in these cases, by frequent spraying with your **LIQUID PEPTONOIDS**."

LIQUID PEPTONOIDS can be taken by patients unable to ingest food in any other form. In *dyspepsia* and *loss of appetite* its effects are positive, its digestive properties assisting in the digestion of food taken and its peptogenic properties quickly stimulating the natural digestive secretions of the stomach.

PANCROBILIN.

Prepared (in both Liquid and Pill form) from Extract of Pancreas and Bile.

This preparation is designed expressly to increase the digestion and absorption of fats.

We believe that the fat-digesting properties of pancreatine and bile are inseparable, and that without their union in the intestinal tract but little, if any, fat would be digested and absorbed.

PANCROBILIN will be found of great service in *Phthisis* and other wasting diseases, *Nervous Prostration*, *Constipation*, *Inanition*, *Malnutrition*, *Intestinal Indigestion* and wherever there is a failure to assimilate fats.

If the skin is first wet with **LIQUID PANCROBILIN**, the inunction of oils will be greatly facilitated.

LIQUID PANCROBILIN is put up in pound bottles. **PILL PANCROBILIN** is put up in bottles holding 100 pills. The coating of the pills will resist acid digestion, when given as directed, but will be quickly dissolved in the alkaline secretions of the duodenum.

PHOSPHO-CAFFEIN COMP.

(Granular Effervescent.)

Formula for each dessertspoonful:—

Caffein.

Acidi Phosphorici aa, grains, ss.

Antipyrin.

Ext. Apii. Grav. dulc. (Celery), aa grains, j.

Sodium Bromide, grains, v.

The satisfactory results produced by **PHOSPHO-CAFFEIN COMP.** in *Headaches*, *Neuralgia*, *Insomnia*, *Neurasthenia* and general *Nervous Irritability*, are not due to the effect of any one ingredient, but to the happy effect of the combination. A thorough series of comparative tests have demonstrated the superiority of the above formula over any other in the market.

REED & CARNRICK, New York.

Tabasco Pepper Sauce

OR LIQUID PEPPER.

Is simply the Pulp of the Ripe Pepper Extracted by Pressure.

The seed of this Pepper was obtained from Central America, and by careful cultivation in Louisiana for many years has been so improved in strength, flavor and aroma, as to have become a new variety of Red Pepper, superior to all others. The pulp is so handled as to retain all the flavor, strength, aroma and color of the ripe fruit, and to keep unimpaired in any climate. It excites the appetite, promotes digestion, and is pronounced, by connoisseurs, to be the finest condiment in the world. For medicinal purposes it recommends itself by its purity, strength and diffusible form.

Manufactured by E. McILHENNY,
NEW IBERIA, LA.

For Sale by all Wholesale Grocers.

NATRONA BI-CARBONATE OF SODA.

(ABSOLUTELY PURE.)

The nature of the raw material from which NATRONA BI-CARBONATE OF SODA is made—viz., kryolith, a mineral containing *pure sodium*—insures a purity and uniformity of product which cannot be obtained from any other known material. In making BI-CARB. Soda from any other raw material, the use of sulphuric acid is a necessity, but none is used in any part of the process of making NATRONA BI-CARB.; hence its entire freedom from the slightest trace of arsenic, which is always present in ordinary soda. Its absolute purity and entire freedom from all traces of *sulphate of soda*, common salt and other impurities, render NATRONA BI-CARB. NEARLY TASTELESS, and being bolted through the finest bolting-cloth, insures the finest stage of division.

To these indisputable facts the attention of CONSUMERS of soda is specially called. They are IMPORTANT, and should influence both those who use and those who sell soda, to buy and sell NONE BUT THE BEST.

The NATRONA BI-CARB. Soda is kept in stock by almost every wholesale druggist and grocer throughout the United States, of whom it may be ordered.

Natrona Bi-Carb. Soda is unequalled by any other brand of English or American Manufacture.

COLDEN'S LIQUID BEEF TONIC.
ORIGINAL LABEL:
"Colden's Liebig's Liquid Extract of Beef and Tonic Invigorator."
AN INVALUABLE AID IN THE TREATMENT OF ALL CASES OF DEBILITY.

Established 15 Years. Endorsed by Scores of Physicians.
Essentially Different from all other Beef Tonics.
Beware of Imitations.

COLDEN'S LIQUID BEEF TONIC consists of the Extract of Beef (by Baron Liebig's process), spirit rendered non-injurious to the most delicate stomach by extraction of Fusel Oil, soluble Citrate of Iron, Cinchona, Gentian and simple aromatics. An official analysis of this preparation by the eminent chemist ARTHUR HILL HASSALL, M. D., F. R. S., and an endorsement by SIR ERASMUS WILSON, F. R. S., is printed on the label of each bottle.

Its Range of Action Embraces all Cases of Debility.

By the urgent request of several eminent members of the medical profession, I have added to each wineglassful of this preparation two grains of SOLUBLE CITRATE OF IRON, and which is designated on the label as "No. 1," while the same preparation, without Iron, is designated on the label as "No. 2." It acts directly on the sentient gastric nerves, stimulating the follicles to secretion and gives to weakened individuals that first pre-requisite to an improvement, an appetite.

I will, upon application, send a sample bottle of Colden's Liquid Beef Tonic to any physician in regular standing. Please ask your Dispensing Druggist (if he has not already a supply) to order it. In prescribing this preparation physicians should be particular to mention "COLDEN'S" viz: "EXT. CARNIS. FL. COMP. (COLDEN)." It is put up in pint bottles and can be had of Wholesale and Retail Druggists generally throughout the United States.

LAWS HONESTLY EXECUTED.

In our issue of February 14th we had occasion to comment upon the peculiar manner in which the Dairy Commissioner of New York and his assistant have executed the laws. They seem to think and act as if there was but one law, and that for the punishment of the manufacturers and sellers of oleomargarine; and while devoting their time, energy, and all the money they can get appropriated to this sole purpose, the people of this State are allowed to be poisoned and robbed by infinitely worse swindles in the way of bad butter sold at extortionate prices. The markets and stores of New York are full of disease-breeding, rancid, worked-over grease, called butter; but presumably in the interest of the many who make and sell this disgusting stuff their illegal actions are overlooked and winked at, but the makers and sellers of honest, pure and healthy oleomargarine are not only prosecuted but persecuted. It may perhaps be too charitable for us to take this view of the action of the Dairy Commissioner, but we will let it go at that. We refer to it again at this time because we have before us a copy of the thir-

tieth annual report of the Inspector of Milk and Vinegar of the city of Boston for the year 1888. "This report could be profitably reprinted by the State of New York, and a copy presented to our Dairy Commissioner, to our State Board of Health, and to every official connected with any of our local boards of health. It would show them how laws are properly, honestly, and impartially executed in Massachusetts. In the common interest of the public welfare, we earnestly wish that the sanitary laws of this State were as wisely conceived and as faithfully and skillfully executed as they are in Massachusetts, and we would hold up before our Health Board and its officials as a model in scientific attainments, executive ability and fearless impartiality, the gentleman whose report we are quoting, Dr. James F. Babcock. This report, after giving the statistics of the work accomplished during the year, proceeds to explain in detail the practical workings of the office, the methods of executing the laws, the manner of taking samples, the chemical standards and test employed, the system of detection, the action and decisions of the courts in cases arising under the laws, and the various adulterations found. Valuable information is then added about the nature and sale of skim milk, thin and thick cream, and buttermilk. Then follows a chapter on oleomargarine, with a complete account of the workings of the oleomargarine laws, the actual facts about oleo, the opinions of scientists of its sanitary effects, the manner and conditions of its sale in Boston, the representations under which, and the prices at which, it is sold in comparison with butter, the effects of its sale on honest butter, its relations to the agricultural interests of the State, and the editorial opinions of the dairy press. Colored butter and its imitations, renovated and made-over butter, are next handled without gloves. Some thirty or more patents granted by the United States and foreign Governments for converting rancid, putrifying or decayed butter and butter scrapings, into marketable "gilt edge dairy butter" or "cabbage leaf covered fresh roll butter," are quoted, and make appetizing reading for those who have always been officially misinformed that they must avoid "bull butter," and buy only "farmer's butter." It is clearly shown that the "honest farmer" can give a liberal discount to the oleomargarine manufacturers, and then throw them completely in the shade in the making of nasty butter. Disgusting ingredients, as butter color, are officially proven to have been constantly employed, and oleo oil is the cleanest adulterant used by these virtuous butter makers. Space forbids further quotations, but we again urge a perusal of this instructive and fearless report upon our officials, in hopes that it will shame them into doing their duty to the whole people, without prostituting their office to the selfish interests of the few.

FELLING TREES BY ELECTRICITY.

Hitherto machines for felling trees have been driven by steam power, but this is sometimes inconvenient, especially in thick woods, and electric power has recently been adopted in the Galician forests. Usually

in such machines the trunk is sawn, but in this case it is drilled. When the wood is of a soft nature the drill has a sweeping motion and cuts into the trunk by means of cutting edges on its sides. The drill is actuated by an electric motor mounted on a carriage, which is brought up close to the tree and shackled to it. The motor is capable of turning round its vertical axis; and the drill is geared to it in such a manner that it can turn through an arc of a circle and make a sweeping cut into the trunk. The first cut made, the drill is advanced a few inches and another section of the wood removed in the same way until the trunk is half severed. It is then clamped to keep the cut from closing, and the operation continued until it would be unsafe to go on. The remainder is finished by a hand-saw or an axe. The current is conveyed to the motor by insulated leads brought through the forest from a generator placed in some convenient site.

FOOD, FRAUD AND FOLLY.

"Instead of attempting to prohibit the manufacture of any imitation food product, all State legislation should be in the direction of compelling imitations to be sold for what they are and nothing else."

The foregoing is an extract from an editorial article on the adulteration question, in the Philadelphia Times. It expresses exactly the sentiment that the AMERICAN ANALYST has maintained for the past five years. When the law rigidly compels every dealer in food commodities to vouch for the precise character of what he sells, one of the greatest evils associated with the adulteration trouble will be obviated. The government chemist, in his recent report, quoted at the time in this column, stated that official investigations, wherever conducted, show that the great majority of substances used for adulterants are not injurious to health. The public is being much more liberally cheated than it is being poisoned. It is an erroneous idea that any substance used as an adulterant of, or a substitute for, a food product is to be avoided as itself being injurious to health. Food adulteration is carried on by manufacturers to make money quickly and safely, and it is to their interest to keep themselves well posted on the subject of cheap and harmless substitutes. The adulteration alarmists, ignoring those well established facts, seek with feverish zeal to keep the popular imagination inflamed with the idea that the land is constantly flooded with poisonous sophistications, and that health and life are being incessantly endangered. Agitators of this class are as arrant humbugs as the frauds they pretend to denounce. They are mostly either the hungry penny-a-liners of the sensational daily press, or they are amateurs who fatuously mistake a grain of benevolence in their own composition for scientific aptitude, on the strength of which they set out as "crusaders" to regenerate the world. A blatherskite of this amiable stamp poses in Philadelphia, where he has succeeded in making himself the everlasting laughing stock of the community. He started out by styling himself a "universal benefactor;" but for some time past he has

dropped that title to set himself up as a "society," of which he is understood to constitute the board of officers and the entire membership in his single person. He is harmless, however, and, whenever he comes to the surface, amusing, likewise. Happily the public has become too well educated on the subject to give much heed to such nonsense. So far as food products are concerned, the weight of scientific opinion declares that on an average only about two per cent. of the whole amount consumed is adulterated, and of that percentage the most of the sophistications are not harmful to health. In regard to drugs, the data are not so complete, but it is only food adulterations that we are now considering. Small as the proportion of such frauds is, there are undoubtedly some that are dangerous, and their exposure and extirpation cannot be too energetically attempted. Only, in the presence of a real, tangible enemy, let us not be betrayed into idiotically assaulting windmills.

ADULTERATION APATHY.

Under the provisions of certain sections of the Act to prevent the manufacture or sale of adulterated food or drugs in the District of Columbia, approved October 12, 1888, any health officer, inspector of nuisances, or food inspector of the District, may submit samples of food or drugs at the Internal Revenue office of the Treasury Department for analysis. Purchasers of food or drugs are also entitled to submit articles purchased. Though this act has now been a law for four months, not a health officer, inspector or citizen of the District of Columbia has submitted an article of food or a drug to the Internal Revenue office for examination. This has not been the fault of the department, if what Mr. Richards, the microscopist of the office, says is true. In conversation in regard to the matter, he said to a correspondent last week: "This office has done all in its power to urge the citizens of the District to avail themselves of the provisions of the act. It has brought the matter to the attention of the Commissioners, the health officers and the newspapers of the District. There has been no result. Officials and citizens will simply not take the trouble to bring food frauds to the attention of this office. We cannot take the initiative. The law does not give us that authority; so all we can do is to wait. Nearly, if not every State in the Union has a statute to prevent the manufacture or sale of adulterated food or drugs similar to the law in force in this District. So far as I know, Massachusetts is the only State in which prosecutions for violations of the law are being successfully carried on. New York State intrusted the State Board of Health with the duty of seeing that its law was observed. The Board made an arrest, the case was tried, and the defendant was dismissed, the judge ruling that he had done nothing for which he could be held, as the adulterants used were not poisonous. So it goes. People are not alive to the importance of the subject. So long as they are not poisoned, they do not seem to mind being cheated."

VACCINATION.

That obtuse fraction of the community which prides itself upon blind opposition to vaccination might be moved to a more liberal attitude on the subject if it would condescend to look into the results that have been reached under its practical application. In Paris, for instance, where the law requiring vaccination is feebly enforced, the mortality from smallpox ranges from 136 to 10.1 to the 100,000 inhabitants, while in the principal German cities, where the vaccination laws are rigidly enforced, the death rate is but 1.44 to the 100,000 inhabitants. London, under compulsory vaccination, has a death rate from smallpox of but 0.6 to the 100,000 inhabitants. On the other hand, in the Canton of Zurich, in Switzerland, since the compulsory vaccina-

tion law was repealed in 1883, the death rate from smallpox has risen steadily from 8 to 85 to the 100,000 inhabitants.

NAILING A LIE.

Our esteemed contemporary, the *World*, is generally carefully edited, but occasionally erroneous statements will creep into its columns. One now before us, in the market reports of the issue of February 21st, is so maliciously mendacious and so clearly shows the source of its inspiration that we deem it necessary to call attention to it. While disclaiming any knowledge, the genius who edits that column attempts to use "whispered rumors" as the basis of an accusation against the Chicago beef dressers that they have raised \$25,000 to buy a member of the New York legislature. If he had any brains at all he would not make such a foolish statement, and if he had any experience as a journalist he would not make himself a laughing stock by the silly assertion that the refrigerator cars in which dressed beef is shipped from Chicago are air-tight or ammonia tainted, when every tyro knows that those cars are ventilated by slat windows and that the ammonia process of producing artificial cold is never used and that the patents on refrigerator cars are not owned by any of the dressed beef men. The whole article is but a tissue of falsehoods on a par with several articles that have appeared in that column before, and is so evidently introduced there in support of the unscrupulous designs of New York speculators that it is high time the little methods of the underling who writes it were looked into by the managing editor. Certainly such articles are not for the interest of the people.

CHARMS OF CELIBACY.

A SKETCH OF HOW A MAN SEWS ON BUTTONS.

Did you ever see a man in the solitude and privacy of his study, attempt to sew a button on by himself? It is, in all its details, one of the most interesting performances in the world. First, he hunts for a button. Generally, to secure it he robs Peter to pay Paul, and cuts one from another garment. This may be much larger or smaller than the size he is wearing. Next, he hunts for a needle. Probably he goes out and buys a paper of needles. He always chooses the largest needles, having an impression that larger needles will sew stronger than small needles. As to thread, he gets the coarsest he can find, and this he doubles. He would thread his needle. He takes the big needle in one hand, and his coarse black thread in the other; he bites off the thread to the desired length; then he tries to twist it to a fine point. Generally, in this he succeeds in making two and sometimes three fine points out of one end. Of course, he can't get all these points through the needle's eye at once. He tries hard to make the needle and thread get on friendly terms with each other. Sometimes it is the needle that kicks, sometimes the thread. Sometimes he really imagines he has threaded his needle. It is an ocular delusion. The thread has missed the needle's eye half an inch. It is harder work than sawing wood. At last the needle is threaded. Now he tries to sew the buttons on without taking his trousers off. This proves a failure. He twists himself into an uncomfortable position, and so would sew. But he cannot sew so. He runs the needle into his finger and makes an inaudible exclamation. Again the needle slips into a fleshy part of the hand, which induces a very audible dash from the operator. The recording angel knows what is going on inside of him, and debits him with every item. He sews hard. He has forgotten all about the necessity for a thimble. He jams his thumb down on the needle's head, and it punctures his thumb or runs under the nail. By-and-by he sews the button's eye full of thread. His big needle does not pass through any more.

He must stop. He ends by winding the thread as many times as it will go under the button, and perhaps he leaves off with two or three inches of thread sticking outside. A woman can through many outward indications, tell when a man has been trying to sew on a button. He doesn't know the shibboleth of needle and thread, and it catches somewhere every time. At last the button is sewed on, and he is proud of his work.—*Housekeeper*.

LIFE FAILURES.—"I hold that no man deserves to be crowned with honor whose life is a failure," said Cicero, the heathen philosopher. "He who only lives to eat and drink and accumulate money is a failure. The world is no better for his living in it. He never wiped a tear from a sad face, never kindled a fire on a frozen hearth. I repeat with emphasis that he is a failure. There is no flesh in his heart. He worships no God but gold."

EASY EXPERIMENT.—Cut three leaves of red cabbage into small pieces, and, after placing them in a basin, pour a pint of boiling water over them, letting them stand an hour; then pour off the liquid into a decanter. It will be of a fine blue color. Then take four wine-glasses—into one put six drops of strong vinegar; into another, six drops of solution of soda; into a third, the same quantity of a strong solution of alum; and let the fourth glass remain empty. Fill up the glasses from the decanter, and the liquid poured into the glass containing the acid will quickly change to a beautiful red; that poured with the soda will be a fine green; that poured in with the alum will turn to a pretty purple; while that poured into the empty glass will remain unchanged.

Custom's Injuries.

Described by a noted London Dentist.

37 HIGH HOLBORN, LONDON, W. C.

GENTLEMEN: I consider the bristle tooth brush has to answer in no little measure for the receding gums around the necks of the teeth so constantly brought to our notice. After thoroughly testing the

I have no hesitation in saying that any one who uses it for one week will never go back to the old bristle brush with its attendant miseries of Loose Bristles and Constantly Wounded Gums.

Faithfully yours,

J. SHIPLEY SLIPPER, Dental Surgeon.

THE DRESSED BEEF WAR.

(The Journalist, February 16.)

HOW IT INTERESTS THE NEWSPAPERS.

The newspapers of the land have been filled with items about the action of the various legislatures on certain laws which have been proposed to prevent the sale of beef in those States, unless the animal before slaughtering has been inspected in the State where the beef is to be sold. It is plain, of course, that the law is intended to exclude the sale of Chicago dressed beef. No law of this kind is ever introduced without some motive, and in this instance the motive is easily discovered by an examination of the papers that are in favor of, and those that are opposed to, such a law. The papers in favor are some of those that represent the interests of Western cattle ranches and one or two papers that are the organs of butchers. The more influential dailies, like the *Chicago Tribune*, *Times* and *Herald*, the *New York Tribune*, *Times*, *World*, *Herald* and *Commercial Bulletin*, and the *Philadelphia Press*, *Ledger*, *Record* and *Inquirer* have expressed very unfavorable opinions of the law. This was principally on the ground that such a law which would seek to protect a few against the legitimate competition of many, would be a bad precedent of State protection sure to be followed by retaliatory measures. The claim, under the cloak of which the passage of the law was to be pushed, that it would prevent the sale of meat from unhealthy cattle has been proven erroneous, because national inspection could accomplish the same thing without any unfriendly interstate prohibitory laws. Another claim that it would help the Eastern farmer, has also been disproven, because the Eastern farmer does not suffer from the competition of dressed beef, but from the dangerous competition of Western live stock, which can be raised cheaper there. New York, New Jersey and Connecticut could not raise sufficient beef to supply the home market. The only interests to be benefited, and that is somewhat doubtful, are those who slaughter beef in the East. These arguments, *pro* and *con*, as taken from the papers who have expressed an opinion, have so far been sufficient to defeat the bill in New Hampshire, Ohio and Pennsylvania, and no doubt the bill will meet with a similar fate in the other States. If it should pass, however, some of the best lawyers in the country have expressed the opinion that the law will be declared unconstitutional. The whole subject, as it has been treated by the press, proves again that the newspaper, fraternity can always be relied upon for good common sense in the intelligent handling of such questions, and that no influence can be brought to bear that will swerve them from the purpose of honestly and fairly representing the opinions of the whole people.

(New York Daily News, February 16.)

A QUESTION OF GOOD AND WHOLESOME MEAT.

At this day of improved appliances and facilities for the transportation of dressed meat over long distances and its complete preservation *in transitu*, there ought to be some method available to protect the market against supplies of an unwholesome quality of such food without having recourse to measures that would raise its price. Of course questions of health in relation to the sale of food products are of first importance, but it is a question whether, from a reasonable sanitary point of view, there is any justification of the movements in certain State Legislatures to indorse the passage of laws providing that no fresh meat shall be sold in their respective States unless the animals are inspected on the hoof and slaughtered within the confines of the States where such products are sold. There is no reason why there should not be provision, through national legislation if necessary, for the proper inspection of cattle wherever they are slaughtered and for the condemnation of such as may be diseased or unfit from any cause. The requirements of adequate inspection having been provided for it might be considered more desirable in some respects, and mainly in respect to the wholesome quality of the food, that fresh meat be conveyed dressed over long distances than on the hoof. The condition of cattle is certainly not improved by their subjection to the ordeal of transportation some hundreds of miles by rail, after, perhaps, a long and exhausting tramp over the plains under the drover's whip. There would be a better assurance of wholesome meat to the consumer, and a less cruel experience for the animals themselves, if it could be made convenient and practicable to have them slaughtered even upon their native heaths and

packed for transportation direct from their grazing ground. As there must necessarily be an interchange of food products between the States, a wholesome quality in such products would, no doubt, be better insured by the operation of some system of national inspection and of vigorous condemnation of the unfit than by laws inoperative beyond the respective State jurisdictions. Nor should the desideratum of cheapness be lost sight of in legislation to regulate the conditions under which food products shall be sold. While statutory provision, as nearly as possible thorough, should be made to keep unwholesome articles out of the market, recourse should be encouraged to methods and appliances, such as science and invention furnish, to make food cheaper without deterioration.

(New York Evening Post, February 9.)

AN UNCONSTITUTIONAL SCHEME.

Although the Granger Meat Bill has been defeated in the Ohio Legislature, and is stoutly opposed in Pennsylvania, the movement appears to be spreading. The legislatures of Missouri and Kansas have now taken it up, and a proposal quite unprecedented in our history has been made by the latter to the former "to send representatives to a joint conference of interested States and arrange matters to suppress the dressed beef monopoly." This ridiculous scheme is in conflict with the Constitution of the United States (Article 1, Section 10, Clause 3), which says: "No State shall, without the consent of Congress, enter into any agreement or compact with another State." This prohibition is a very wise one. Unless it is lived up to in spirit as well as letter, the Union might as well be dissolved; in which case all the little fragments could adopt separate schemes of protection for their butchers, sausage makers, butter makers, soap boilers, coal miners, wood choppers, and what not. The outcry against the "dressed beef monopoly" is a demand for the protection of inferiority against superior talent or superior advantages of some kind. It was inevitable that the doctrine of protection as between the different States should make its appearance sooner or later. In fact, this is not its first appearance. Pennsylvania protects her own insurance companies by a differential tax of two and one-fifth per cent. on the premiums received, and New York retaliates by taxing Pennsylvania companies at the same rate on the business they do here. This is all wrong, and would not stand the test of judicial investigation in the Federal courts. The Granger Meat Bill, if it is ever enacted in any single State, will be swept aside by the first Federal judge who lays his hands on it.

(New York Evening Post, February 12.)

FIGHTING AN IMAGINARY EVIL.

A syndicate of State legislatures is a new thing in American polity. Such a phenomenon is in course of promotion or incubation at the West, to deal with what is called the Dressed Beef Combine. The Senate of the United States also has the subject under consideration, a committee having been appointed last year to take testimony and report upon it. This committee held sessions at St. Louis and other western cities, and is expected to make some kind of a report before the adjournment of Congress. It seems, however, that the legislatures of Missouri, Kansas, Tennessee, and half a dozen other States cannot wait for the action of their common agent, the Government of the United States, but must needs take the matter in hand themselves, not individually but collectively. It is said that eleven States have given their assent to the movement, whatever it may be. Naturally, there is a good deal of confusion as to the steps to be taken. The real grievance is cheap beef, the ostensible one being diseased beef. Mixed up with the grievances, real and pretended, is a deal of sympathy for the ranchmen on the plains, who, it is said, are suffering from the low prices of cattle, and are ground down by the Dressed Beef Combine to starvation rates. So we have for the basis and *raison d'être* of the syndicate of legislatures two real evils to be fought against, and one imaginary one, viz.: cheap beef, low priced cattle, and inadequate inspection laws.

We can understand how the last evil, the imaginary one, may be met, if any single legislature has the courage to grapple with it, the Granger Meat Bill of Pennsylvania having blazed the way. But since the legislature of that State, as well as that of Ohio, has been lacking in intrepidity, we do not see much prospect of advance in that direction. The syndicate of States will therefore be expected to give attention principally to the evil of cheap meat, and here the difficulties to be encountered are serious. France and Germany manage it by means of the tariff on imported meats. The former country can even protect one locality against another by octroi duties, as Paris has lately protected her own carpenters and cabinet makers against the pauper labor of

the provinces. With such examples before us, why should not the syndicate of legislatures, or some one of them, memorialize Congress to authorize internal tariffs to protect the slaughtering industry of the several States? The Constitution says that "no State shall, without the consent of Congress, lay any imposts or duties on imports or exports." The consent of Congress is the only thing needed to clear the way for the discouragement of cheap beef. A duty of two or three cents per pound would probably be all that the local butchers would need. How this step would help the ranchmen to a higher price for their cattle is not so clear. Perhaps a bounty on steers of a certain weight, to be paid under regulations of the Internal Revenue Department, would meet that difficulty.

(New York Times, February 15.)

STATE TARIFFS ON BEEF.

The Meat Inspection bill introduced in the Assembly yesterday by Mr. Nixon differs from the Cantor bill in that residents of the State are permitted by its terms to sell the meat of animals raised by them without such inspection as is required in the case of meat or cattle brought from another State. In this respect it resembles the Inspection bill introduced in the Tennessee Legislature and in the Legislatures of two or three other States. This exemption of the meat of animals raised in the State simply makes the bill ridiculous.

The movement for the inspection of cattle and other animals while alive and in the State where the meat procured by killing them is to be sold would not deserve much attention if it were not taking place simultaneously in many States, and were not based upon a common belief that the four great firms engaged in the dressed beef business have for some years been in combination with respect to the buying of cattle as well as to the selling of beef. The cattle growers on the far Western ranches have reason to complain of the action of these firms, for the price of cattle has been seriously depressed without a corresponding decline of the price of beef to consumers. But while consumers in Eastern cities may complain that they have gained little or nothing by the fall of the price of Western cattle, they cannot join the Eastern butchers in supporting inspection bills that are designed to exclude Western dressed beef, for the butchers find the price of this beef too low. The consumer thinks the Western dressed beef should be sold at lower rates because the price of Western cattle has fallen. The butcher complains that it is already sold at so low a rate that Eastern-killed beef cannot compete with it. The butchers, therefore, undertake to shut out the dressed beef by a law that shall prevent the sale of the beef of cattle that have been killed in another State. This is what the inspection bills introduced in ten or fifteen States amounted to, for the assumption that the Western dressed beef has not been inspected and is diseased is a pretext unworthy of honest and intelligent men. The aim of the proposed legislation is to raise the price of beef to the consumer in the East by methods that would at the same time lower the quality of a considerable part of the supply—that part furnished by the importation of live cattle from the pastures beyond the Mississippi. When these bills are so changed as to exempt domestic beef from inspection the scheme is reduced to its simplest terms and the insincerity and dishonesty of the sanitary pretense are more clearly exposed. The convention, composed of three Senators and five Representatives from each of twelve States and three Territories, that is to be held in St. Louis on March 12, may very properly make thorough investigation concerning the alleged combination of the four great firms of slaughterers and shippers, but it will accomplish nothing and only make an exhibition of folly if it shall commend a system of prohibitory State tariffs upheld by sanitary inspection laws.

(New York Commercial Advertiser, February 18.)

REFERRED TO THE CONSTITUTION.

The Governors of Nebraska, Texas, Iowa, Missouri, Ohio, Indiana, Wyoming, New Mexico and Arizona have agreed to her proposition of the Governor of Kansas for an interstate convention in St. Louis on March 12, having in view the suppression of the Chicago beef and pork-packing industries. The Governor of Pennsylvania has signified his desire to participate, although he does not appear to have been invited. When the representatives of these enterprising States and territories have been convened on the 12th of March, it will be advisable for some judicious friend to read them article first, section tenth, of the United States Constitution. Then they can go home again with the happy consciousness of having done their duty and enjoyed at the expense of their several commonwealths a pleasant little railroad trip.

WOMAN'S WORK.

WHAT SHE IS INDIVIDUALLY AND COLLECTIVELY ACCOMPLISHING.

A new publication is before us "devoted to the interests of women." It is entitled *The Business Woman's Journal*, and its editor and publisher is Miss Mary F. Seymour, well known as one of the leading stenographers of this city. The new paper is a handsome thirty-two page folio, handsomely printed in large clear type on fine paper. The initial number contains as a frontispiece an excellent portrait of Miss Frances E. Willard, "the woman who leads 200,000 women," accompanied with a biographical sketch of that energetic lady. A large number of articles interesting to feminine readers, and especially useful to them on account of their practical business recommendations, are embodied in the *Journal*, and we take pleasure in inviting attention to the new enterprise, inasmuch as it manifestly bids fair to be skillfully conducted in behalf of woman's interests, and particularly in behalf of those of working women.

Miss Redmond, a young Irish artist, who has been studying for three years in Italy, and recently returned to Dublin, has been commissioned by Lord and Lady Aberdeen to execute the bust of Mr. Gladstone.

It is stated that the Empress Frederick has bought land at Steglitz, for the erection of a hospice for young girls who have been abandoned by their natural protectors.

The Queen of the Belgians has, since the commencement of the New Year, started a household magazine called *La Jeune Fille*. Its object is to instruct girls in housewifery, and to keep their minds well up in matters concerning art and literature. The Queen herself contributes all the articles relating to household affairs, while, as theatrical critic, Her Majesty uses the pseudonym of "Madame Reyer." Princess Clementine of Belgium contributes articles on art and literature under the *nom de plume* "Marthe d'Orey; and Carmen Sylva, Queen of Roumania, supplies the poems. Crown Princess Stephanie of Austria is going to supply several pictorial attractions, and the Archduchess Marie Valerie of Austria's assistance has been solicited. This very regal magazine is expected to be a success. When queens and princesses give advice on any subject, or set examples of housekeeping skill and economy before girls, they generally get many converts. If a queen sets the fashion of sweeping her room and making her own bed, there is no knowing how many fair ladies will follow her example.

A Swedish insurance company recently elected Miss Karolina Wiersholm, the first lady doctor in Sweden, to examine women insurers.

A collection of the literary works of women is being made by Mlle. de Walker, the daughter of a French literary man, and the books will be exhibited at the forthcoming Paris Exhibition.

Senorita Ernestina Perez, the first lady doctor in Chili, took her degree at Santiago, and has just started in practice at Valparaiso.

The widow of Moritz Schafer carries on her husband's publishing business in Leipzig, and continues to issue the *Neue Bahnen*, which is the organ of the women's unions.

A French lady, who recently ably defended her father in a law court, has had the title of Doctor of Science conferred upon her.

STEEL PAYEMENTS.—As a substitute for granite blocks, steel paving is attracting considerable attention, its durability being said to be quite a point in its favor, and its cost being somewhat less. It consists of steel strips about $2\frac{1}{2}$ inches wide and one inch thick, rolled with a channel on the side exposed to traffic, and with notches about six inches apart. These strips weigh 11 pounds to the yard, are laid across the street a distance of about five inches between centres, and their length is only

sufficient to extend to the middle of the street, so that the proper slope from the centre to the gutters can be secured. They are bolted together so as to insure them against lateral slipping, and are fastened to wooden sills. A firmly constructed bed of gravel composes the support for this pavement, while between the steel strips a mixture of pitch and cement is poured, filling the interstices to a level with the tops of the strips, and rendering the surface comparatively smooth.

LATE SUPPERS.

SOME PRACTICAL HINTS FOR ACQUIRING CHEAP INDIGESTION.

While our cousins of Great Britain profess to wonder at the fondness of the Yankee for pie, we, in our turn, are full of wonder at the temerity with which John Bull indulges in late suppers. Below are a few recipes for that meal, taken from the *London Housekeeper* for February. They are recommended on account of their cheapness, and are introduced with a quotation from a 16th century poet: "Who goes to bed supperless, all night tumbles and tosses." It would appear as though steady persistence in "bed lunches," such as these, would be hardly more conducive to sound and peaceful slumber, and that in the end they would prove tolerably costly:

1. Boil one or more eggs hard and set them in water so as to easily remove the shells. When shelled, cut them in slices, dusted with pepper and salt. Have ready some thinly cut bread and butter, on which a little toasted cheese should be spread. Put the egg between the slices, and serve. Cost, 4d.

2. Make some good oatmeal porridge, and serve with jam, treacle or stewed fruit. Cost, 4d.

3. Pound several sardines in a mortar, with pepper, salt and a little vinegar. Spread the mixture on thinly cut bread and butter. Next, mix some shrimps as finely as possible, and put a little between each sandwich. Cost, 4d.

4. Have ready some melted butter, seasoned with minced parsley, pepper and salt. Get some large oysters and dip each one in the above mixture. Replace the oysters on their shells, sprinkle some lemon juice on them, cover with bread crumbs, and bake in a quick oven. Serve in the shells. Cost, 8d.

5. Take equal parts of cooked potatoes, carrots, savoy, one small onion, and chop them finely, with pepper and salt to taste. Bind with one egg, then bake the mixture. Serve with slices of lemon. Cost, 3d.

6. Grate some good cheese, and thereto add pepper, salt and bread crumbs, moistened with stock. Line a few patty-pans with cold mashed potatoes, and fill with the foregoing ingredients. Next chop up a few pickles, and strew them on the mixture. Cover with mashed potatoes, and bake. Cost, 3d.

7. Boil two ounces of macaroni for one hour. Drain, and add a quarter of a pint of milk, half an ounce of parsley chopped fine, a teaspoonful of lemon, thyme powdered, a little chopped lemon peel, with pepper and salt to taste. Put into a white buttered dish, and bake for twenty minutes. Cost, 3d.

SIGHT AND HEARING.

VELOCITIES OF LIGHT, ELECTRICITY AND SOUND.

From an observation of the eclipses of Jupiter's first satellite in 1675, Römer, a Danish astronomer, first deduced the velocity of light, his calculations establishing for it a velocity of 190,000 miles per second. M. Foucault succeeded in determining the velocity of light experimentally by means of an apparatus based upon the use of the rotating mirror, and calculated it to be 185,157 miles per second. In 1849, M. Fizeau measured the velocity of light directly, by ascertaining the time it took to travel from Suresnes to Montmartre (a distance of 28,334 feet) and back again, making a total travel of $5\frac{3}{4}$ miles nearly. He made use of a toothed wheel re-

volving at certain known velocities, a pencil of rays being transmitted through an interval between two teeth of the wheel, which was placed at Suresnes, was reflected by a mirror placed at Montmartre, through a series of tubes and lenses, directly back to the wheel. He found the velocity of light to be 196,000 miles per second. The mean of the three values above given is 190,385 miles, and the value generally taken as the velocity of light very nearly agrees with it, being 190,000 miles per second. Wheatstone, by the employment of a rotating mirror and an interrupted coil to give sparks, ascertained the velocity of electricity to be 288,000 miles per second. Kirchhoff estimated this velocity in a wire, where it met with no resistance, to be 192,924 miles per second. But, according to MM. Fizeau and Gounelle, its velocity with an iron wire is 62,100 miles, and with a copper wire 111,780 miles per second. These measurements, however, were made with telegraph wires, which induce opposite electricities in the surrounding media, thus producing a resistance which reduces the velocity. The nature of the conductor has some influence on the velocity, but not the thickness of the wire, nor the tension of the electricity. Direct measurements to ascertain the velocity of sound were made by Moll and Van Beck in 1823. Two hills near Amsterdam, 57,971 feet apart, were taken as stations, and cannon were fired at stated intervals simultaneously at both stations, and the elapsed time between seeing the flash and hearing the sound was noted by chronometers. From these experiments the velocity of sound was estimated to be 1092.78 feet per second in dry air. But it has been found that the velocity varies with the temperature, *i. e.*, at 32 deg. Fahr., the velocity of sound is 1090 feet per second, and that for every degree of temperature above this $1\frac{1}{4}$ feet must be added to the velocity. Fogs or rains, unaccompanied by winds, do not interfere with the velocity of sound, but wind alone will interfere with its velocity materially. There is some reason to believe that loud sounds travel somewhat faster than low ones, which was first remarked by Prof. Mullet while carrying on blasting near Holyhead. In water the velocity is about 4,708 feet per second, nearly four times as much as in air; in wood, from 12,000 to 16,000 feet; in iron, 17,500 feet; and in copper, 10,500 feet per second.

A DAY WITH SOROSIS.

A SPRIGHTLY PEN-PICTURE OF THE LADIES' CLUB IN SESSION.

It is not always necessary to go abroad in order to learn what is taking place in one's own home, but we believe many, even of our New York lady friends, will find something fresh in the following piquant sketch of a meeting of the Sorosis contributed by a correspondent of the *Chicago Sunday Herald*:

There is something suggestive of late dinners and lost money, confused reminiscences and revolving key holes, headaches and depressing reflections in the idea of a social club, but when the club is dressed up in petticoats and tied with a sash, in other words, founded, organized and officered by women, then its chief dissipation is a luncheon of muslin sandwiches and cambric tea, its wildest revel a discussion on some esoteric problem or transcendental theory.

The oldest and most famous woman's club now in active operation is the Sorosis, which was founded by Jennie June, Alice Cary, Kate Field and a dozen bright, literary women, more than twenty years ago. It holds its social meetings on the first Monday in each month, in the banqueting hall and parlors at Delmonico's, and probably there is no psychological, economic or scientific problem from the azoac formation to the decline and fall of the bustle that has escaped its investigation and solution. No complicated social question whose premises have not been established fearlessly in their councils. Most women who join this club have either a vocation,

a mission, or a hobby, though occasionally a sweet, quiet woman slips inside the mystic pale who is content to be what God created her, simply a woman, nothing more, and whom the others regard with superior pity, because she has no ambition, no life work, no peculiar and glorious calling.

Any time after 12 o'clock on these famous Mondays, if you whisper "Sorosis" in the ear of the cerberus who waits in the elevator to guard the approach to these occult mysteries and ceremonies, you will be promptly elevated to the third floor where the rites are performed, providing you have the semblance and guise of a woman; for though the members of Sorosis do not wish to arrogate anything of superiority to themselves because they have had the good fortune to be women, and are willing to admit that the accident of being born a man is a misfortune and not a fault, still no man may gain admittance to their festivities. As the elevator slowly ascends a peculiar sound or succession of sounds arrests your attention as though sharp, staccato notes were being picked from the shrillest strings of a hundred violins. It is only half as many women talking together of their hobbies and their husbands, their servants and their serials, their children and their charity—all talking at once, nobody listening to anybody else, and no one minding the discourtesy. There are novelists and journalists, physicians and professors, agitators and reformers, presidents of societies, teachers of new theories, missionaries and advocates—each capering wildly about on her own particular hobby horse and apparently oblivious of every other prancing charger. In one corner of the room, under the surveillance of an apostle of physical culture, in a dress reform costume without any waist line and a generous breadth of seam are the celebrities of the day, looking very much subdued and not a little frightened. Threading her way in and out among the throng, an elderly woman with a diamond S engraved with the word "Sorosis" blazing on her shoulder and a peculiar smile on her lips, which, beneath its velvet, bears a suggestion of claws, greets each new comer with a dignified salutation. It is the president, Mrs. Thomas, whose black silk dress is turned away from folds of white mull that are caught at the throat with a diamond pin, while a heavy chain and seal of gold are suspended from her belt. Her head, unlike the others, is unbonneted, and has a peculiar fortification of shell combs, one above the other, with terraces of grayish brown hair between. Her face presents the impenetrable passivity and possibility of a garrisoned fort. Your respect and admiration grow for the woman when you determine later the slow process that has crystallized the features into their granite immobility as you watch her quietly and firmly hold in leash a hundred women's tongues for ten full minutes while another woman speaks, and then make the speaker stop talking when her time is up, in spite of her efforts to continue, re-enforced by the requests of her friends. Just outside the banquet hall is a smaller room where heavy wraps are tossed aside and bangs are coaxed into coquettishness. Few women, however famous and learned, having souls above the setting of their bonnets, the swing of their draperies and submission of their wind-tossed and rampant tresses, and continually re-enforced by the newcomers from this retirement, the larger room grows more and more crowded and bewildering. Diamonds flash and silks rustle, sleek tabbies go purring about the room, occasionally stretching their claws ominously and furtively; hens cackle and gabble over the particular addition they have made to the world's nest of eggs, and sometimes cackle loudest of all when they have laid 20 eggs at all; wise women look on with smiling faces from some secure corner and gather material for new work and magazine stories, and scheming women are whispering softly to their unsuspecting sisters concerning the new officers presently to be appointed.

Women have nice instincts and practical judgment in household economy, consequently the luncheon is served the first thing on the programme. "Never try to do

business or hold consultation on an empty stomach," said a woman, as she seated herself at the table; people are always unreasonable when they are hungry. I think if married women would remember that, there would be fewer misunderstandings between them and their husbands. They ought never to try to tell their husbands any grievance, present him with any bills, or enter into any arguments until after dinner. Then he will listen and use a little reason." "Yes, but Mrs. B. has a model husband," interrupted a lady near. "I know him because he's my husband's brother. He isn't a bit like my husband." "Well," continued Mrs. B., smiling a little, "I will say that we have lived together forty years next Thursday, and I am just as glad now to see him when he comes home as I was forty years ago. I don't mean to say that we always think alike on all subjects and never disagree. No. There are many subjects we never try to discuss. I don't nag at him and he never nags at me. That's all; and the reason we get on so nicely together is because I was not in too much of a hurry to get married, I waited until I found the right one. I believe there is a right one for every girl if she only finds him." And then all the unappropriated birdies and antiquated fowl who had failed to find a mate bridled, fluttered their feathers, flopped their wings, cackled harder than ever, and took a new lease of life. "I think some girls fail to find the right one because he isn't quite tall enough to suit them, or don't part his hair in the middle just to please them," said a woman with bright eyes twinkling under snowy hair. "To tell the truth, I came near doing it myself. I refused my husband three times before I accepted him." And then a big woman lunged into the argument with: "There are so many avenues of employment open to women now that girls are more particular in choosing husbands," and settled back into her place again, wheezing, while all the chick-a-biddies and venerable hens looked more conscious than ever, while a brown-eyed woman in a cardinal bonnet said: "Perhaps they ought to consider the suggestion my husband gives his men friends, when he says to them: 'You are expecting a faultless woman for a wife, did you ever think what the girl would get who married you? You're not exactly perfect, are you?'"

By this time all the people at the long table were seated, with the president at the head, the celebrities down the center and the guests at the foot. In another room the members of the club arranged themselves about the small table, clattering like sparrows. Pretty women, called custodians, fluttered around the table, introducing and serving people, and the revel began. Being a ladies' luncheon, of course its elements were bouillon, croquettes, patties, a salad, ices and cake; its active principle water, of which quantities were consumed with every course, and the conversation never ceased. On one side the talk was of the mighty Western Union Telegraph girls who were discharged for smoking cigarettes, and one of the old Sorosis members said: "I don't know why they should be discharged any more than the men," and on the other a woman was telling that she had no trouble keeping house. When some of her perplexed sisters inquired into it and found out that she had two old servants who had been with her for years, with two younger ones for extra occasions, and that she never went into her kitchen the wonder ceased. "What is Mrs. D——'s opinion on the subject?" said one, and another answered: "Haven't you known her long enough to find out that she hasn't any? I never had any fame or celebrity, but thank God I have opinions."

And so the stream of talk flowed on and on until the lunch was over, and the ladies gathered into the large room around a table behind which the president sat, mallet in hand, and the garrison-like features of her face bristling with figurative bayonets. Beside her Jennie June sat, nervously opening and shutting her fan, thinking of the speech she had to make. She has a strong, resolute face, with great intensity of expression and an extreme nervousness of bearing. Across

the table Alice Cary's favorite niece, the little "Lucy" of her writings, sat with a quantity of short curls beneath her bonnet and attended by a little maiden satellite with dark curls and a lavender dress. Mary Kyle Dallas sat at one side in a black satin dress, her smiling face framed in a black bonnet. She is a fair woman with blonde hair, just touched with silver, and a bright, intellectual face animated by an expression of constant interest in all about her. Marion Harland, Grace Greenwood and a host of other celebrities gathered about in conventional bonnets and gowns, scarcely distinguishable from the butterflies and bees of social and domestic life.

Not once, but many times, the little silver mallet struck the table, accompanied by the decided: "Ladies! ladies! order, order, please!" Before the silence fell and the roll was called some one sang a love song and Mary Kyle Dallas read a little original poem about "Cupid's School" in a sweet, low voice, with her little peculiar lisp.

"Mrs. Thomas! O, excuse me, Mrs. President," came from a far corner, "we didn't hear; please have her read it again. We don't know any more about love than we did before."

So Mrs. Dallas began to read again the lines that she said possessed one great merit, that of brevity. Still they could not hear, and at last, standing on the elastic springs of her chair, with what dignity she could muster and laughing like a school girl, she read the lines and the women ah'd and ah'd in concert.

There was some more love music, some sighing nightingale's ode to something or other, and then the serious business of the day began. It was a debate as to whether the condition of the workingwomen would be most benefitted by individual effort or legislation. The first speaker called was not a Sorosis woman, but one of the invited celebrities, with a bunch of carnations glowing on her breast and a silver king's daughters' cross gleaming beneath them. She was an impassioned, magnetic speaker, who pictured the wrongs and oppressions of working girls in touching, thrilling words. Half of the women in the room were in that delicious condition just preceding a burst of tears. There's nothing the average woman so revels in as pathos, and they were all thinking they never would wear a ready-made ruffled skirt again while women were starving while making. Then the ten minutes which limits a Sorosis speech came to an end, and cracking down upon the flowers of the speaker's eloquence fell the little silver hammer.

"Oh, please, Mrs. Thomas, let her finish—I'll give her my ten minutes," said a woman who had been talking all the time, and all over the room there were entreaties from the women.

Tap, tap, tap went the silver hammer, and "Ladies," came the clear, calm voice, "some one must move a suspension of the regular custom in this instance."

"I make that motion," shouted ten or twelve women, and "I second it," supplemented fifteen or twenty more.

So the speaker resumed. The ladies slowly dissolved into an ecstasy of tenderness. Little sniffs were heard here and there, and perfumed handkerchiefs fluttered fragrance as she concluded that the silver cross of the king's daughters was to close the breach between capital and labor. No one quite understood which side of the argument she supported.

The veteran debaters of Sorosis shook their heads ominously and fluttered their fans nervously. As old war horses champ the bit and paw ground while the enemy maneuvers, impatient that the fight does not begin, so they longed for the attack of the question itself in argumentative and parliamentary discussion.

Then a gentle, low-voiced woman of the "Kindly Club" read a long and beautifully written paper on protoplasm and the individual element in germ life, or star mist, or something of the kind. It was exquisitely written. The round, full phrases flowed smoothly on and on, like a broad, calm river, full of carefully chosen,

high sounding words and expressions, and, as near as could be determined, the efforts of the "Kindly Club" were to transform the wickedness of the employer to generosity. It was but a marshaling of troops, not the roar of musketry, and the old war horses champed the bit and fretted more than before.

"Why doesn't she touch on the question," gasped the president as she rose to call her to order, not realizing that she couldn't stop that torrent of words. It flowed on peacefully to the close.

Then another visitor with rarely practical ideas and thorough knowledge of the working women's condition talked as long as she was allowed, whereupon an old Soro-is member rose quietly, delivered herself of four sound ideas in less than forty words, and sat down. One after the other came the clear arguments cutting like sword thrusts straight at the knot of the arguments, and the war horses pricked up their ears and neighed in answer.

Then a pretty pink and white girl fluttered out on to the platform and began a speech which she had evidently committed to memory. She was brimful of inspiration, ecstasy and politics. She knew just how to set everything straight, although she was only twenty-two. She soared along on the wave of her argument like a bird on full-spread wing until suddenly bang went the iconoclastic hammer of the president, crashing into the pretty images of her fancy. She had touched on the doctrine of free trade, and all political discussion is prohibited in Sorois. She righted herself up again, and once more began to soar aloft when the sound of the mallet called her back to earth again. This time it was the land reform that laid her low. Said the president: "I am very sorry, but we do not allow party politics to enter into our discussions.

"But this is no land reform party," said the chairman of the debate, who was the speaker's friend.

"I must differ with you," said the president and firmly and decidedly she called the lady to order.

There was a buzz all over the room, indignant protests at the president's decision, equally indignant objection to the speaker's unfortunate allusion. In the midst of it all the girl herself was getting white about the lips and her cheeks and eyes were blazing. The dispute waged fast and furious and in vain the silver hammer rang out its warning sound, but never once did the president lose her temper, her dignity or her official smile.

At length a white haired Ulysses of the camp arose and said decidedly: "I must agree with the president in her decision and hope the meeting will come to order." The girl on the platform bit her lip, gulped down a sob, said with a ghastly attempt at a smile: "There is no land reform party now, but I hope there will be one soon," sat down on the edge of the platform and cried.

Then the trained war horses galloped to the front and fought it out among themselves. Sword flashed against sword, steel clashed against steel, ringing and striking fire every time and the dignified president came up like a conquering general, magnanimous but triumphant, begged everybody's pardon for the decision she had been obliged to make in conforming to the laws of the society, and left the field with flags flying and drums beating.

Meanwhile, in the corridors women wire-pullers were waylaying the unsuspecting, interviewing them with regard to the coming election, and doing the neatest, cleverest kind of lobbying as the ladies, with flushed, tired faces, wended their way homeward, wondering whether the workingwomen needed protection or not and which side they were on any way.

A MIXED TAP.—A well recently bored for gas at Pittsburg delivers fresh water, salt water and gas at the same time. There are two casings, one within the other; the outer one, 100 ft. down, taps a fresh water stratum, while the inner pipe reaches the salt water and gas at 200 feet down.

METALS.

INQUIRY INTO THE CAUSE OF THEIR METALLIC LUSTRE.

Dove was the first to attempt an investigation of the causes of metallic lustre. He had examined, by the aid of a stereoscope, two images of a pyramid, one being colored blue and the other yellow, expecting to find a relief image of a green color. He was, however, astonished to find that the mixture of colors gave a reflection like that of a polished metallic surface. Having repeated the experiment, using a black and a white image, he obtained the metallic gray of lead and tin. Dove concluded that metallic lustre is due to two reflections from superposed surfaces, and that the accommodation of the eye being different for each color, a perfect coincidence of the images of different colors was impossible. The lustre of metals would thus be caused by a reflection from the actual surface and another from beneath the surface. This explanation attributes a considerable degree of transparency to the metals—more, indeed, than seems consistent with fact. Brucke offered another theory, according to which the color of light reflected from bodies not possessing the metallic lustre should be independent of the local color—that is, the color of the reflecting body—while in the case of metals the color of the reflected light is that attributed to the substance, the incident light being white. Brucke also considered that a certain intensity of reflection was a necessary condition for metallic lustre, this intensity resulting from the opacity of the metals, and he mentions the phenomenon of total reflection as producing a perfect imitation of metallic lustre. The theories of Dove and Brucke represent opposing views of the transparency of the metals; the one considers them as opaque, the other as transparent. Herr W. Spring (*Bul. Soc. Chim.*, 50, 219) endeavors to reconcile these views by a study of the nature of the surfaces of the solids he has obtained during his experiments on the compression of solids within polished steel cylinders. He finds that substances which in the form of powder are opaque produce solids that have a metallic lustre, whatever the nature of the substance, while such substances as yield powders more or less transparent formed cylinders having vitreous surfaces, looking as if varnished.

COLDS AND CATARRHS.

CAUTION AGAINST EXPOSURE TO THE NIGHT AIR.

The following advice regarding the risk incurred through sleeping with the windows of one's apartment open is condensed from the *Buffalo Medical Journal*:

It may be safely asserted that the majority of colds need not occur, even in an uncertain and changing climate like ours, if people would understand and practice a few simple hygienic precautions. We cannot expect to discuss every hygienic rule in detail that would apply to each particular case, but we hope to present certain general principles which can be elaborated or reduced according to the needs of the individuals. Your attention is first directed to a custom, that may be called almost a natural one, and which we consider to be very pernicious. I refer to the habit of sleeping with the windows open at night when the external temperature is below a certain point. This custom is practically universal in this country, and is an important factor in accounting for the frequency among us of the catarrhal diseases of the upper air passages. I fail to find, either by observation or investigation, that any other people living in our latitude indulge in this custom. The people of Europe are very careful to prevent the external night air from entering their sleeping apartments. Their windows are double, and usually you will find a closed stove or fire-box in the same room, and, in many other ways, their houses are not as well ventilated as ours. We can derive many hints from the customs of the lower animals upon this subject. They seek to ren-

der the air, when sleeping, as warm as possible in various ways. When the temperature is below that of their bodies, they seek their dens, huddle together, or curl up so that the nose is placed close to the body. The birds even, whose native element is the air, when sleeping hide their heads beneath their wings or under their breasts. Instinctively they seem to appreciate that the body is in a state of least resistance during sleep, and that the air they then breathe should be properly warmed so as not to act as an irritant to the delicate lung structure. Besides the suggestions just made, the reasons for greater care at night or during sleep are not difficult to understand. We remove our warm clothing and put on that which is much lighter. We are not sure on retiring that the temperature will not be 20 deg., or more, lower in the morning. A slight restlessness will expose a part of the body to rapid cooling, which generally leads to the development of a cold. Again, the air must reach the lungs sufficiently moist and warm, or else it will act as an irritant and cause trouble. The nose is the organ where this is accomplished, but it is limited in its ability, and cannot raise the temperature of the air beyond a certain point. According to the experiments of Aschenbrandt and Kayser, the inspired air in passing through the nose can be raised about 40 deg. F., but no more. These experiments are quoted at length by Bosworth as confirmatory of his views on the physiology of the nose, first stated in a paper read before the American Climatological Association in 1885, and entitled, "Hay Fever, Asthma, and Allied Affections." It is, of course, not unreasonable to conclude that when all the vital processes are in a state of least activity, as, during sleep, the inspired air would not be raised even as many as 40 deg., though no experiments have been made in demonstration of this. Formulating a rule, however, on the basis of these facts, we can say that when the external temperature is below 65 deg. F. at nine o'clock in the morning, the windows of all sleeping apartments should be closed. This is the advice I have been accustomed to give patients for some time past, and it certainly has been a factor not only in relieving the chronic conditions, but in the prevention of fresh acute attacks of inflammation of the upper air passages. They will tell you they are much more comfortable on rising in the morning; the throat is less rough; there is less cough and less discharge. I believe that if this rule were universally followed "catarrh" would not be as frequent as it is. This part of the question may be concluded with a quotation from a paper by Dr. J. B. Johnson, of Washington, on this subject: "Even the most robust, who sleeps in the open air, frequently awake in the morning with a husky voice, dry nostrils, pains in the limbs, and uncomfortable feelings about the chest, to tell them that they took cold during the night, and to warn them against the risk and imprudence of letting the external air too freely into their sleeping rooms at night."

CARE OF THE HOUSE.

THE AESTHETICS OF SWEEPING AND DUSTING.

Our business is to consider sweeping and dusting from the usual point of view of carpeted rooms occupied by either a bed, a lounge, or sofa, as well as by other ordinary articles of furniture. An important part of good work is good tools to work with. A set of three covers, cotton or linen, as large as full-sized sheets, are an indispensable part of a housekeeper's outfit. With one of these cover the bed, after it is made, the lounge, or the sofa. Dust the small articles off carefully, and put them in an open clothes basket. Dust the chairs and movable furniture, and have them carried to another room. Then shake the curtains, and pin them up without folds. Brush the shades and roll them up to the top; open the windows and blinds wide, and dust them and clean them if necessary. If the mantel is covered with velvet or plush, paper may be laid over it

and pinned down, provided a cotton or linen cover is not at hand. A careful housekeeper will save the residuum of her teapot, day by day, and at this point will sprinkle the moist tea leaves over the carpet, allowing them to remain a few moments before beginning to sweep. If a box sweeper is used, the tea leaves will not only be unnecessary, but impracticable, as it takes up dust, not *debris*. The tea leaves should be simply damp, not wet, and no liquid be allowed to remain with them. The object of them is two-fold. First, to take up the particles of dust and prevent them from flying. Second, to freshen the appearance of the carpet. Short cut grass answers the same purpose, but the refuse of the teapot is usually more convenient. The ordinary broom is the best instrument made for sweeping a carpet. Use it from the shoulder, with long even strokes, not in quick jerks, sweeping toward the hearth. The carpet should be laid right for it, not toward the door, as the threshold is in the way of exit, and the dust lodges in the crevices between the floor and the carpet, and fills the halls. Gather up every particle that has been swept together, with dust brush and dust pan, and, while the room is "settling," with a little warm water, soap and a flannel cloth, wipe up the corners, window sills, the tiles of the fire-place, if there are any, and the hearth. Then brush the tops of the curtains, the valance, if any; take down the curtains, shake them and restore them to their position, and also remove the cover from the mantel-piece. Rub the mirrors, or framed glass, with a folded newspaper, and the glass and china ornaments with an old silk handkerchief kept for the purpose. Use a long feather duster for the pictures, and a piece of cheesecloth for dusting stands and light furniture. A piece of old cotton, oiled, should be kept for heavier articles of carved wood, walnut, or wood that is not varnished or veneered. The dusting and re-arrangements are part of the same process, and are done at the same time. There are always lights and positions in which certain things look best, and it is part of the beauty of life to have the details of our environment put into harmonious relations with each other. How can the ignorant understand this? It takes fine hands to do fine work, and a capable head to think out the best methods.

DOMESTIC DIETETICS.

SPECIALLY PREPARED, FROM PRACTICAL TESTS, FOR THE
LADY READERS OF THE "AMERICAN ANALYST."

SEASONABLE FOOD.

February.

MEATS.—Beef, mutton, ham, kidneys, liver, venison, sausage, pork.

GAME AND POULTRY.—Grouse, hare, pigeon, chicken, duck, turkey, goose.

FISH.—Bass, cod, crabs, eels, carp, catfish, flounder, halibut, herring, lobster, mackerel, mussels, oysters, perch, pike, rock-fish, salmon, smelt, whitefish.

VEGETABLES.—Artichokes, beets, beans, cabbage, carrots, celery, garlic, lettuce, onions, parsley, parsnips, potatoes, shallots, spinach, tomatoes, turnips.

FRUIT.—Apples, bananas, grapes, oranges.

PRACTICAL RECIPES.

PLAIN TOMATO SOUP.—Take a shin bone, have it broken, and put in soup kettle with five quarts of cold water; allow it to boil steadily and skim; in an hour put in four dozen of good-sized tomatoes; do not skin them; boil until your soup is reduced to one-half; take a tomato masher and crush the tomatoes; pass through a strainer; return to kettle, and remove the beef before serving; season with salt and pepper; canned tomatoes may be used.

BEEF TEA.—Take one pound of the best beef; cut it into thin slices and scrape the meat fine; put it with two-thirds of a saltspoonful of salt into one pint of cold water in an earthen bowl, and let the mixture stand two or three hours, stirring it frequently; place it, in the same vessel covered, on the back part of the range, and let it come very gradually to a blood heat and no more; strain it through a fine sieve or muslin bag, and it is ready for use.

OYSTER SAUCE FOR CODFISH.—One quart of oysters (when buying them ask for a little extra liquor), put over the fire, rub up pieces of butter size of small egg with two even tablespoonfuls flour; stir this in the oysters till dissolved; pepper and salt to taste, and on no account let it boil but more than an instant; the oysters must not be hard. This quantity is sufficient for eight pounds of fish.

VEGETABLE PIE.—Scald some Windsor beans; cut into dice young carrots, turnips, artichokes bottoms, lettuce, mushrooms, celery, and parsley, with green peas; onions and spinach may be added if liked. Stew the vegetables partially in gravy and season with pepper and salt. Trim the edges of a dish with parsley; put in the vegetables, pour the gravy over this, cover and bake. Cream or milk slightly thickened with flour and butter may be used instead of gravy.

BIRD'S-NEST PUDDINGS.—Pare, core, and cut three apples through the centre crosswise; place each half in a small, buttered mould; fill the centre with a mixture of boiled rice well spiced and sugared, and surround the apple with a custard. Put the small tins in a large one containing hot water, and boil slowly half an hour. Set the whole in the oven to brown slightly. When done turn out on dishes, let cool slightly, and surround each with whipped cream. Place in each centre three colored sugared almonds, and serve.

CHRISTMAS CAKE.—One pound of flour, half pound of currants, half pound of butter, half pound of sugar, two teaspoonfuls of Horsford's baking powder, three eggs, half pint of milk. Mix the baking powder thoroughly in the flour, then rub in the butter, add the sugar, currants and flavoring, beat the eggs and mix them with the milk, and after mixing them all thoroughly together bake in a papered tin in a moderate oven; flavor with lemon.

CREAM WALNUTS.—Two pounds white sugar, a teacupful of water, boil until it threads. Flavor highly with vanilla, take from the fire and stir until white and creamy. Have walnuts prepared; make the candy into small round cakes, press walnuts into the sides, drop in granulated sugar.

A CONTEMPTIBLE FRAUD.

We have been shown a bottle which bore the imprint and had originally contained Lea & Perrins' Worcestershire Sauce. This had been filled with a vile vinegary compound pretending to be a sauce, and labelled "Worcester Sauce," on labels bearing a close resemblance to the genuine Lea & Perrins' Worcestershire Sauce labels, and was put upon the market by a prominent Washington Street, San Francisco, canned goods house. As this house is quoted by the mercantile agencies as possessing considerable capital, it would seem that they ought to be above such a peacune business as buying up old bottles and selling them refilled with an inferior sauce under labels calculated to deceive the purchaser as to the true character of the contents. The deception will not work more than once, and must inevitably lead the duped purchaser to look with suspicion upon all other goods bearing the name of a house who would be guilty of such deception. It would not surprise us to hear of legal proceedings being commenced against this firm by the American agents for Lea & Perrins, and in that case the ruin of such a firm's reputation must be inevitable.

OPIUM SMOKING.

HOW THE DRUG IS PREPARED FOR USE.

The material used is Chandoo or Indian opium. Arrived at the manufactory the ball of Chandoo is cut in two, and the outside portion of the wrapper is thrown away, great care being taken that every portion having the smallest sign of opium upon it is carefully saved for further treatment. This crude opium has darkened in color with age [*sic*], and has by this time become a rich dark brown, almost black, about the color of Stockholm tar and of the consistency of putty. This is kneaded and beaten for three or four hours until an expert workman considers it tough enough for baking. It is then spread in a layer of three quarters of an inch in thickness over the bottom of a concave brass dish or basin, about two feet across and eight inches in depth. This is inverted for about half an hour over a charcoal fire in an earthen or brickware furnace the size of the rim of the pan, the operator continually turning the pan round to ensure an equal distribution of heat. These furnaces are very neat specimens of the potter's art, in shape very like the old-fashioned wooden wash-tubs that were made from the ends or halves of barrels. They appear to be made in segments bound together with iron bands. The brickwork is about two inches thick, the furnace is about two feet across and ten or twelve inches in depth, fitted with dampers, etc., for regulating the heat. The fuel used is charcoal, and the temperature of the room in which the boiling is done is like that of an oven, making an adjournment into the hot sun agreeable and cool in comparison. After exposing the cake to the heat of a clear steady fire for about half an hour it is nearly ready for the next process, and the skilled workman lifts it up and examines it very frequently. When his practiced eye tells him that it is done, he lifts it off and sets the dish on the edge. Then, taking hold of the upper edge, he tears off a thin sheet. It separates readily in the form of an immense wafer about eighteen inches across. It looks very like what the children in the Southern colonies call "brandy snaps," generally considered by school-boys to be a very delectable morsel. The pan is then returned to the furnace, and the process repeated till the pan is empty. The "wafer" is placed on an open wire grid and dried off over the fire underneath the brass pan. When dry and crisp the cake is taken from the grid and broken into small pieces in another brass dish. These small pieces accumulate until the baking is finished, when they are all put into the water to soak. The soaking reduces the cakes to pulp, and extracts nearly all the pure opium from it. The liquid is then poured into a pan for its final boiling. The residuum is washed and boiled until every particle of opium has been extracted. The liquid obtained from the different boilings of the residuum and of the wrappers is reduced by evaporation, and then added to the last boiling of the No. 1 stuff, reduced by this time to a very small bulk. After further inspissation, and when the extract is of the consistency of treacle, it is considered finished, and is then taken into a storeroom under bond, whence it is issued when the excise duty of 30s. per pound is paid on that required for home consumption. The whole process takes twenty-four or twenty-six hours to complete, and the opium requires to be stored for at least three weeks to mature and become fit for use. The Chandoo loses about 50 per cent. in the process. The opium is imported from China in small brass tins, about the size and shape of quarter-pound mustard tins, which hold about half a pound. On the present small scale this experiment is not expected to pay, but the Chinese firm referred to above is willing to pay a good round sum yearly for the privilege of manufacture, and hope, should they obtain it, to secure a large portion of the Australian opium trade. They intend to import Chandoo direct from Calcutta, and also to grow it in the Northern Territory.

Subscriptions \$1 per year. Now is the time to subscribe.

BACTERIA IN THE GLACIERS.—Dr. Schmelt of Christiania has found vast colonies of bacteria in the ice of the Jerstedalsbræ glacier and in the streams fed by it. They appear under the form of rods, and resemble the *Bacillus fluorescens liquefaciens*. During their period of growth these bacteria emit a fluorescent material. They multiply with great rapidity during periods of thaw.

WOODITE.—The material known as "woodite," devised by Mrs. Wood, a clever Englishwoman, promises to become a very useful substance. Its chief ingredient is caoutchouc. During the past few months it has given good results for a variety of purposes, and is now declared to be especially adapted for many other uses. According to Sir Edward Reed, M. P., it has been produced in divers forms, such as fine sheets and ribbons for waterproof articles, dense blocks for resisting the blows of shot and shell, and particularly satisfactory rings for engine packing. One process converts it into an elastic, sponge-like substance; and another, in which it is mixed with whalebone cuttings, gives it a rough or frictional quality, suitable for mats. Some curious naval applications have been worked out. It is made into armor plates, which, on being penetrated by a shot, close so tightly that no water is admitted; and it is formed also into light and convenient cylinders for carrying compressed air to drive lifeboats, torpedo-boats and scout-boats.

BINDERS FOR THE AMERICAN ANALYST.

We have selected the "Handy Binder" for binding the ANALYST, because of the following advantages: It is elegant in appearance, strong, durable and this new method of binding allows the opening of the pages perfectly flat, owing to the fact that none of the side of the paper is used. This method also permits the taking out and replacing of one or more papers from any part of the file without disturbing the other parts. After the file is completed it ceases to be a temporary binder, and

with its contents becomes a perfectly and strongly bound book. Owing to the unusual size and strength of the linen binding cord in combination with two metallic binding strips (loops) the strength and durability of the binding is wholly unequaled by any method yet introduced. Price, sent post-paid, 75 cents. To any subscriber renewing his subscription at \$1 sent directly to this office, we will send one for 25 cents, and we will give one free as a premium for every new subscription sent to us with \$1.

BUSINESS NOTES.

WHAT SCOTT'S EMULSION HAS DONE.
OVER TWENTY-FIVE POUNDS GAIN IN TEN WEEKS.
EXPERIENCE OF A PROMINENT CITIZEN.

THE CALIFORNIA SOCIETY FOR THE
SUPPRESSION OF VICE.
SAN FRANCISCO, July 7, 1886.

I took a severe cold upon my chest and lungs and did not give it proper attention; it developed into bronchitis, and in the fall of the same year I was threatened with consumption. Physicians ordered me to a more congenial climate, and I came to San Francisco. Soon after my arrival I commenced taking Scott's Emulsion of Cod Liver Oil with Hypophosphites regularly three times a day. In ten weeks my avoirdupois went from 155 to 180 pounds and over. The cough meantime ceased.

C. R. BENNETT.

HORSFORD'S ACID PHOSPHATE
IN SLEEPLESSNESS

Dr. Henry Tucker, Brattleboro', Vt., says: "I have used it in several cases of sleeplessness, with very pleasing results."

WASHING CLOTHES.

Clothes to be made free from disease breeding microbes must be heated in water to at least 212 deg. Fahrenheit. Therefore, any directions which advises against boiling clothes are not given in the interest of clean, healthy clothes. Hot water is an absolute necessity, and all the exaggerated evil effects of hot water can be easily remedied or avoided, but cannot safely be omitted. No soap that is well made and does not depend upon fabric destroying chemicals can be thoroughly rinsed from clothes without hot water, and unless the soap is thoroughly removed the clothes will become stiff as a board. Use Pyle's Pearline according to directions on each package and your clothes will be clean.

Subscriptions \$1 per year. Now is the time to subscribe.

BUFFALO LITHIA WATER

In the Uric Acid Diathesis, Bright's Disease, Chronic Inflammation of the Bladder, etc.

JAMES L. CABELL, M. D., A. M., LL. D., Professor of Physiology and Surgery in the Medical Department in the University of Virginia, and President of the National Board of Health.

"The Water of Buffalo Spring No. 2 contains in notable quantities two of the ALKALIES which are accredited as extremely valuable in the treatment of GOUT, LITHIASIS, and Liver Affections. I refer to the CARBONATES of POTASH and LITHIA.

"I have recently read with interest a paper in 'The New York Medical Journal' on the Buffalo Lithia Water in Diseases of the NERVOUS SYSTEM, in which the writer, Dr. Boyland, citing his own observations and those of other eminent physicians, ascribes to this water a special virtue as a direct tonic for the NERVOUS SYSTEM in cases of CEREBRAL exhaustion. I have only had occasion to test its effects in this direction in cases in which the NERVOUS SYMPTOMS may have been due to LITHÆMIC conditions. In these cases the relief following the use of the remedy was very decided."

Dr. WM. A. HAMMOND, of New York, Surgeon-General U. S. Army (retired), Professor of Diseases of the Mind and Nervous System in the University of New York, etc.

"I have for some time made use of the Buffalo Lithia Water in cases of affections of the NERVOUS SYSTEM, complicated with BRIGHT'S DISEASE OF THE KIDNEYS or with a GOUTY DIATHESIS. The results have been eminently satisfactory. Lithia has for many years been a favorite remedy with me in like cases, but the BUFFALO WATER CERTAINLY ACTS BETTER THAN ANY EXTEMPORANEOUS SOLUTION OF THE LITHIA SALTS, and is, moreover, better borne by the Stomach. I also often prescribe it in those cases of CEREBRAL HYPERÆMIA resulting from over-mental work—in which the condition called NERVOUS DYSPEPSIA EXISTS—and generally with marked benefit."

Dr. ROBERT BATTEY, of Georgia, SUGGESTER OF BATTEY'S OPERATION.

"I would state that I have been using the Buffalo Lithia Water, No. 2, in my practice for three years past, in cases of CHRONIC INFLAMMATION of the BLADDER, whether induced by STONE, by enlarged PROSTATE in the aged or by NEGLECTED GONORRHOEA, AND HAVE SECURED EXCELLENT RESULTS, which encourages me to prescribe it for the future."

HUNTER MCGUIRE, M. D., LL. D., late Professor of Surgery, Medical College of Virginia, Richmond.

"BUFFALO LITHIA WATER, Spring No. 2, as an ALKALINE DIURETIC, is invaluable. In URIC ACID GRAVEL, and, indeed, in diseases generally dependent upon a URIC

ACID DIATHESIS, it is a remedy of extraordinary potency. I have prescribed it in cases of RHEUMATIC GOUT, which had resisted the ordinary remedies, with wonderfully good results. I have used it also in my own case, being a great sufferer from this malady, and have derived more benefit from it than from any other remedy."

Dr. WM. B. TOWLES, Professor of Anatomy and Materia Medica in the Medical Department of the University of Virginia.

"BUFFALO LITHIA WATER, No. 2, belongs to the ALKALINE or, perhaps, to the ALKALINE-SALINE Class, for it has proved far more efficacious in many diseased conditions than any of the simple ALKALINE waters.

"I feel no hesitancy whatever in saying that in GOUT, RHEUMATIC GOUT, RHEUMATISM, STONE in the BLADDER, and in all Diseases of URIC ACID DIATHESIS, I know of no remedy at all comparable to it.

"Its effects are marked in causing a disappearance of ALBUMEN from the urine. In a single case of BRIGHT'S DISEASE OF THE KIDNEYS I witnessed decided beneficial results from its use, and from its action in this case I should have great confidence in it as a remedy in certain stages of the disease."

Dr. THOMAS H. BUCKLER, of Paris (formerly of Baltimore), SUGGESTOR OF LITHIA as a Solvent for Uric Acid.

"Nothing I could say would add to the WELL-KNOWN REPUTATION OF THE BUFFALO LITHIA WATER. I HAVE FREQUENTLY USED IT WITH GOOD RESULTS IN URIC ACID DIATHESIS, RHEUMATISM, AND GOUT, and with this object I have ordered it to Europe, from Coleman & Rogers, of Baltimore. Lithia is in no form so valuable as where it exists in the Carbonate (the form in which it is found in the BUFFALO LITHIA WATER), Nature's mode of solution and division in water which has passed through Lepidolite and Spondumine Mineral formation."

Dr. GRAEME M. HAMMOND, of New York, Professor of Diseases of the Mind and Nervous System in the New York Post-Graduate Medical School and Hospital.

"In all cases of BRIGHT'S DISEASE of the KIDNEYS I have found BUFFALO LITHIA WATER of the greatest service in increasing the quantity of urine and in eliminating the ALBUMEN. In certain cases of Melancholia, accompanied by excessive eliminations of URATES and URIC ACID, it is often the only remedy necessary. In GOUT and RHEUMATISM it is highly beneficial, and in many cases of Impotence its restorative qualities have been of undoubted assistance. I have long regarded BUFFALO LITHIA WATER as the most valuable mineral water in use."

Water in cases of one dozen half-gallon bottles, \$5.00 per case at the Springs.

THOMAS F. GOODE, Proprietor, Buffalo Lithia Springs, Virginia.

Needs But a Moment's Thought.

Why not an improvement in the line of Soap? The Railroad—Telegraph—Telephone—Electricity—Sewing Machine, etc., are accepted with gratitude.

PLYLE'S PEARLINE is as great an improvement over soap as now seems possible. Millions realize this fact and use it. Let your servants use it—they will be better satisfied—so will you, and the clothes will not be rubbed, or eaten full of holes in the wash.

The woman who does her own work will welcome the saving of time and drudgery—fact is, a delicate woman can do a large wash—or clean house—with the aid of Pearline, work which otherwise would be utterly impossible. An economical, thrifty housewife must have PEARLINE.

Sold everywhere. Beware of imitations. JAMES PYLE, New York.

"PERFECT IN ALL ITS APPOINTMENTS."

Is what an old traveler said recently of the Sturtevant House, Broadway, cor. 29th Street, N. Y. Then its so central. Rooms \$1.00 per day and upward, with board \$3.00 to \$4.00 per day. Matthews & Pierson.

LEA & PERRINS' SAUCE.

Lea & Perrins', the original and genuine Worcestershire Sauce, has been before the public over a half a century. Like all popular favorites it has long been the standard of comparison and the pattern for counterfeiters who not being able to imitate its excellence offer to the public imitations in bottling, labels and style of putting up. They dare not counterfeit the signature of Lea & Perrins which is on the red label of every genuine bottle, and of which this is a facsimile.

Lea & Perrins

To be sure of obtaining the genuine article, see that the above signature is on the label

LADIES' HOME COMPANION

A PRACTICAL HOUSEHOLD JOURNAL.

Now in its 16th year, well established, tried and true, as attested by a constituency of over Three Hundred Thousand Readers. The publishers, desirous of extending its influence into half a million homes, offer

3 Months Trial for Only 10 Cents.

10 cents (Silver or Stamps) will secure **SIX NUMBERS** of this charming periodical (all different), each copy equal in size, quality and amount of reading matter, etc., to regular illustrated papers that cost 10 cents a copy or \$4.00 per year.

The LADIES HOME COMPANION stands without a peer in literary excellence, typographical beauty, suggestive illustrations and helpful advice for every department of home life. It is beautifully illustrated, and printed on fine, cream-tinted paper, and has a more brilliant array of contributors than ever before, consisting of

8 Regular Editors and Scores of Eminent Writers,

Whose facile pens will furnish **Short and Continued Stories** of absorbing interest, while all branches of household economy that can possibly come within the good housewife's province will be ably treated by experienced editors, and use, beauty and refined entertainment have due attention.

PRACTICAL HOUSEKEEPING.

This department is a well-spring of valuable suggestions for every branch of housekeeping, including a large variety of tested recipes, and how to prepare them at the least expense, in dainty and appetizing forms; also, hints for table decorations, methods of work, etc., and much practical information, covering the entire range of household work, treated in such manner as to interest every housekeeper.

FANCY WORK.

In these departments elegant illustrations and plain directions are given, showing how to make all kinds of fancy work, embroideries, needlework, crocheting and knitting; also suggestions for ornamenting Parlors, Bedrooms, Dining-rooms; arranging and Decorating Furniture, Curtains, etc., so that homes may be adorned with taste, and made attractive with little or no outlay. Instructions will also be given that will enable any one to make many useful and ornamental articles, such as Wall-pockets, Brackets, Fancy Leather-work, Work-boxes and Baskets, Fancy Work with Leaves, Flowers, Grasses, etc.

FASHIONS, Or, WHAT TO WEAR AND HOW TO MAKE IT. Artistic illustrations are always found in this department, with descriptions of the newest and latest Styles and Novelties in Ladies' and Children's Dresses, Hats, Bonnets and other garments, with directions that enable one to dress well and economically. The very finest illustrations are used to make everything plain, so that ladies can make their own dresses, trim their own Hats and Bonnets, and dress themselves and their children with neatness and taste, in the prevailing styles. Each copy of the Ladies Home Companion is worth more than a year's subscription to every young lady and married woman, for this department alone.

MOTHERS find the portion devoted to them invaluable, and filled with a wide range of helpful suggestions obtained from practical experience relating to a mother's duties to her children, how they should be reared and cared for in sickness and in health; also suggestions and illustrations for all kinds of children's garments and many other necessary things.

FLOWERS. The Floral Department is a treasure to the amateur florist and all who love flowers, containing much of interest to those who raise flowers, whether for pleasure or profit.

OCCUPATIONS FOR WOMEN. Women can make money in many ways, and the opportunities for women to become self-supporting are constantly increasing. The Ladies Home Companion aims to keep women informed in reference to those things that wives, mothers and single women are going to earn money, while in all its departments it is the most complete, most readable and

Most Fascinating Ladies' Paper Published.

TOILET.—Recipes and hints for care of hands, face, teeth, eyes, hair, etc., color and harmony in dress, etc.

ETIQUETTE at home and abroad, at the table and on the street, at public gatherings, etc.

CHILDREN'S CORNER sparkles with interesting sketches and splendid stories for wide-awake boys and girls, while an opportunity is given to develop their mental powers by solving puzzles, charades, enigmas, etc., for which prizes are offered.

DEPORTMENT.—Rules, usages and ceremonies of good society, letter writing, good manners, the art of conversing well, accomplishments, home training.

SEASONABLE BILLS OF FARE are given, with plain directions for the economical preparation of healthful, nourishing and palatable dishes, with hints for serving, arrangement of table, reception of guests, etc., etc. Also menu for parties, teas, receptions, Thanksgiving and Christmas dinners.

So popular have our publications become that more than a million people read them regularly.

Mention this paper and address **LADIES HOME COMPANION, Philadelphia, Pa.**

FOR THE THIRD TIME

in our history we have been forced to move into larger quarters to keep up with the demand from our New York, Worcester, Springfield, Providence, Lynn, New Haven, and two Boston stores, and our enormous mail trade. We now occupy two-thirds of an acre of space devoted entirely to custom-work, turning out more garments than any house in the United States. You can order by mail by our system as safely as if you could call at one of our stores. To obtain the Famous Custom-made Plymouth Rock \$3 Pants, first, send 6 cents, for which we will mail you 20 samples self-measurement blanks, and then tape measure, provided you MENTION THIS PAPER, or if you cannot wait for samples, tell us about the color preferred, with waist, inside leg, and hip measures, remit \$3, together with 35 cts. to cover cost of expressage or postage, and we will forward the goods prepaid to any address in the U. S., guaranteeing safe delivery and entire satisfaction or money refunded. Remember, also, that we make to your order, Full Suits, \$13.25, Overcoats, \$12.00, and that for any cause we refund money at buyer's request upon return of goods, or make alterations or new garments free of extra charge.

PLYMOUTH ROCK PANTS CO.

Address all mail to 11 to 17 Eliot St., or 18 Summer St., Boston, Mass.

BRANCH OFFICES—285 Broadway, New York; Burnside Building, Worcester, Mass.; Gilmore House, Springfield, Mass.; 60 Market St., Lynn, Mass.; Butler's Exchange, Providence, R. I.; Register Building, New Haven, Conn.

Any one wishing to learn of our responsibility, may write the American Express Co., at Boston, (capital \$20,000,000) or consult the commercial agencies.

MALTINE

MALTINE is far superior in nutritive and diastatic value to any Malt Extract manufactured in the World. There is no re-constructive that excels Maltine in Phthisis and many wasting Diseases.

MALTINE in its different forms is the only malt preparation we now employ, being so palatable, digestible, and easily assimilated. Of its efficiency in appropriate cases there is no more doubt in our minds than there is of the curative power of Quinine, Cod Liver Oil, the Bromides, and the Iodides.

It deserves to stand in the front rank of constructives, and the constructives by their preventive, corrective, and curative power are probably the most widely useful therapeutical agents that we possess.

PROF. L. P. YANDELL.

MALTINE is a valuable food, a food of priceless value at times of emergency. In fact, in very grave gastric cases it is a food which may be often resorted to when at one's wit's end what to do.

J. MILNER FOTHERGILL.

"Out of 14 trade samples of Malt Extract examined by Messrs. Dunstan & Dimmock, only THREE possessed the power of acting on starch. These brands were MALTINE, Corby's, Stacey & Co's Extract, and Keppler's Malt Extract."

WILLIAM ROBERTS, M.D., F.R.S.

I have subjected "Maltine" and all other leading "Extracts of Malt" to an exact quantitative comparison of their diastatic activity.

The results demonstrate conclusively the far greater diastatic value of Maltine, and enable me to state, without any qualification whatever, that it far exceeds in diastatic power any of the six preparations of Malt which I have examined.

R. H. CRITTENDEN.

Professor of Physiological Chemistry in Yale College.

At the International Health Exhibition held in London, England, the only gold medal and the highest award of merit were given to Maltine by a Jury composed of the best chemists in Europe, and recent analyses made by the most reliable authorities in Europe and America prove conclusively that Maltine—in nutritive and diastatic value—is superior to all other malt preparations now in the market.

NOTE—Physicians will observe that Maltine, as now prepared, is not so viscid as formerly made, being of a more fluid consistency; and, while retaining the nutritive and diastatic value which has given it precedence over all other Extracts of Malt, it is rendered entirely agreeable to the taste of the most fastidious, and is more easily administered. As now prepared, we positively guarantee that Maltine will not ferment or congeal in any climate or at any season of the year.

COMPLETE LIST OF MALTINE PREPARATIONS.

MALTINE (Plain). MALTINE with Phosphates, Iron Quinine, and Strychnine.
MALTINE with Alternatives. MALTINE Ferrated.
MALTINE with Cod Liver Oil. MALTINE with Hypophosphites.
MALTINE with Peptones. MALTINE with Peptones.
MALTINE with Peptones and Pancreatine. MALTINE with Cascara-Sagrada.

Physicians may obtain Maltine from all druggists in every part of the world. In cases where the physician intends to prescribe Maltine, the word "Maltine" should be written, and not simply the words "Malt Extract," or "Extract of Malt."

Send for Pamphlet giving comparative analyses by 100 of the best Analytical Chemists in this country and Europe.

We will be happy to supply any regular practitioner with eight ounces each of any three Maltine compounds that may be selected from our list, providing he will agree to pay express charges on same.

THE MALTINE MANUFACTURING CO.,

34 Warren Street, New York.

Laboratory, Yonkers-on-Hudson.

COLDEN'S
LIQUID
BEEF TONIC.

ORIGINAL LABEL:
"Colden's Liebig's Liquid Extract of
Beef and Tonic Invigorator."

AN INVALUABLE AID IN THE TREATMENT OF
ALL CASES OF DEBILITY.

Established 15 Years. Endorsed by Scores of Physicians.

Essentially Different from all other Beef Tonics.

Beware of Imitations.

COLDEN'S LIQUID BEEF TONIC consists of the Extract of Beef (by Baron Liebig's process), spirit rendered non-injurious to the most delicate stomach by extraction of Fusel Oil, soluble Citrate of Iron, Cinchona, Gentian and simple aromatics. An official analysis of this preparation by the eminent chemist ARTHUR HILL HASSALL, M. D., F. R. S., and an endorsement by SIR ERASMUS WILSON, F. R. S., is printed on the label of each bottle.

Its Range of Action Embraces all Cases of Debility.

By the urgent request of several eminent members of the medical profession, I have added to each wineglassful of this preparation two grains of SOLUBLE CITRATE OF IRON, and which is designated on the label as "No. 1," while the same preparation, without Iron, is designated on the label as "No. 2." It acts directly on the sentient gastric nerves, stimulating the follicles to secretion and gives to weakened individuals that first pre-requisite to an improvement, an appetite.

I will, upon application, send a sample bottle of Colden's Liquid Beef Tonic to any physician in regular standing. Please ask your Dispensing Druggist (if he has not already a supply) to order it. In prescribing this preparation physicians should be particular to mention "COLDEN'S" viz: "EXT. CARNIS. FL. COMP. (COLDEN). It is put up in pint bottles and can be had of Wholesale and Retail Druggists generally throughout the United States.

ELECTRICAL PROGRESS IN NEW YORK.

We had occasion recently to comment approvingly upon the project for adding a special course of instruction in electrical science to the post-graduate department of Columbia College. The *School of Mines Quarterly* of that institution, discussing the same subject, dwells with truthful emphasis upon the fact that New York is particularly the home of electrical capital and invention. She has more telephones in her business offices than are to be found in most European kingdoms. She has more electric lighting than any other city in the world. One of her companies—built up by Columbia boys—has more motors running in the down-town districts than are to be found in all England. She is the headquarters of the largest telegraph system in existence. She is the centre of the leading electric railway work, and the territory that is commercially hers teems with electrical industries of every character. In fact, while America is, by the generous admission of such critics as Professor Ayerton and Professor Forbes, the land where electricity has attained its greatest development, and is, as the London *Electrical Review* remarks, the country that is leading the way and setting the example—New York, beyond all rivalry, is the one city where all the new ideas, new systems and new inventions can be best studied as they require to be, moulded

by the stress of daily use, and subject to the incessant improvement that comes with every increase of knowledge. Under these circumstances, and without in the least forgetting the good work that has already been set on foot in other places to promote the interests of electricity as a technical profession, it is but natural that we should be pleased with the action of Columbia College.

POSTAL SERVICE OF THE METROPOLIS.

Some idea of the vast amount of matter which passes through the New York City post office may be gained from the following statistics: Last year there were 128,131,755 letters, 32,310,025 postal cards, and 35,943,203 miscellaneous packages delivered during the year by carriers, and 52,994,536 letters, 8,519,869 postal cards, and 30,995,086 miscellaneous packages through boxes, making a total of 287,994,464 pieces in all. In the registered letter department, there were 1,317,168 pieces delivered, and 1,049,029 pieces of domestic and 453,850 of foreign origin recorded and distributed to other offices. At the general post office, 1,095,915 money orders were issued and paid, amounting to \$10,230,895.50, and 783,872 postal notes, amounting to \$1,263,378.79. At the sixteen branches the number of orders issued and paid was 220,144, amounting to \$3,250,961.10, and the number of postal notes 88,311, amounting to \$174,476.66. The aggregate business of the money order department for the year amounted to \$87,299,158.95, giving an increase in the business over the previous year of \$4,788,347.21. The total receipts of the office were \$5,162,968.81, and the total expenditures \$1,891,982.48 (including \$802,017.91 expended for free delivery service), giving a net revenue of \$3,270,986.33. The receipts for the last quarter of the year aggregated \$1,458,585.27, an increase of \$121,034.65 over the receipts of the corresponding quarter of the previous year. There were sold during the year 178,218,226 postage stamps, equal in weight to thirteen tons net, 35,302,500 government stamped envelopes, and 46,437,150 postal cards. The total weight of mails received and dispatched daily during 1888 was 248 tons.

THE PARIS EXPOSITION.

It is gratifying to American pride to learn, through *Science*, that the United States will make a creditable display this year at the Paris Exposition. And this is as it should be; for, although nominally a universal exposition, it will be practically a display of the products of republics. The monarchies of Europe will be represented only by private exhibits, while the republics of North and South America have rallied in force. The United States Department of Agriculture will make a splendid showing. Secretary Colman has placed the undertaking in the hands of Professor C. V. Riley, the famous entomologist, an energetic organizer as well as a careful and enterprising scientific observer; and Prof. Riley has already sent forward three carloads of prod-

ucts, which are on the way to France in charge of Mr. F. T. Bickford, an assistant. The bulk of shipments are nearly through with, and the perishable staples will follow during the next month. Congress appropriated \$250,000 to aid exhibitors, and Secretary Colman's quota of this will insure the best illustration that the agricultural resources of this country have ever had on the continent of Europe. Various branches will be represented, as follows: Fruit, Prof. VanDeman and Prof. George Hussman; grain, George N. Hill, St. Paul, Minn.; cotton and fibres, Col. James A. Benford, Duck Hill, Miss., and Charles R. Dodge, Boston; tobacco and peanuts, Alexander McDonald, Va.; agricultural education and experimental stations, W. O. Atwater, Department of Agriculture; vegetables, including hops, M. G. Kern, St. Louis; entomology, including apiculture and silk culture, C. V. Riley, N. W. McLean of Hinsdale, Ill., and Philip Walker, Department of Agriculture; sorghum and other sugar plants, H. W. Wiley, Department of Agriculture; forestry, B. Fernow, Department of Agriculture, and M. G. Kern of St. Louis; grasses and forage plants, George Vasey, Department of Agriculture; meat products, Dr. de Salmon, Department of Agriculture. All articles for exhibition will be forwarded free from New York, and no charge will be made for space in Paris. Prof. Riley has put forth unusual exertions to get the exhibit on the road, and he looks forward with much enthusiasm to the result. He will not leave for Paris till the first week in April.

PURE FOOD PROSPECTS.

According to the *Grocers' Criterion*, the recent Pure Food Convention in Washington does not seem to have been much of a success, and was not very largely attended, hardly any mention of it at all being made by the press. It looks very much as if the movement was likely to die out at an early day unless Congress should be prevailed upon in some manner to take it up and enact effective adulteration laws. The best move in that direction would be a bill to prevent the importation of foreign commodities which are not up to the standard of purity requisite for their commercial handling in the countries where they are manufactured. Relieve our own manufacturers from the competition of cheap foreign frauds, and at least one powerful inducement to sophistication will be removed.

A BREWERS' ACADEMY.

We take pleasure in announcing the establishment in this city of an institution for the practical as well as the scientific education of brewers, under the capable management of Dr. Francis Wyatt, who is widely and favorably known as the consulting chemist of the AMERICAN ANALYST. Dr. Wyatt is an expert brewer, a technical and analytical chemist, Doctor of Philosophy, Brussels University; Engineer of Arts and Manufactures, Central School of Paris; Fellow of the Chemical Society, England; and a well-known contributor to the scientific

F. W. DEVOE & CO.,

ESTABLISHED 1852.

PURE MIXED PAINTS

WE desire to call attention of consumers to the fact that we guarantee our ready-mixed paints to be made only of pure linseed oil and the most permanent pigments. They are not "Chemical," "Rubber," "Patent," or "Fireproof." We use no secret or patent method in manufacturing them by which benzine and water are made to serve the purpose of pure linseed oil. Sample cards containing 50 desirable shades, sent on application.

press of this country and Europe. We learn that he will be assisted by Dr. Carl Rach, Doctor of Philosophy, Wurzburg University, Germany. Students will have, under the experienced tuition of Dr. Wyatt and Dr. Rach, a full theoretical, analytical, practical, working and experimental course in such branches of chemistry and physics as relate directly to the science of brewing ales, lager beer and porter in every modern development. The institution will afford to brewers of ale and lager beer throughout the country the facilities of a well-appointed and skillfully conducted laboratory, in which practical experimental brewings will be daily made, and where all descriptions of raw material and finished product of every kind may be critically examined and conscientiously reported on.

ELECTRO-PLATING.

HOW METALS ARE MADE TO RESEMBLE SILVER.

When a current of electricity is passed through water, decomposition of the liquid takes place, and bubbles of hydrogen gas appear at the negative pole and oxygen at the positive. Like many other electrical and chemical phenomena, we cannot explain this action, but only know that it is so. Likewise, if the electric current is passed through a solution of a salt of copper, silver, gold, nickel and many other metals, the salt is decomposed, the acid element set free at the positive pole or electrode, and the metal deposited upon the negative one. If, instead of the usual wire for conveying the current into the solution, we use a metallic vessel or utensil, the metal will be evenly deposited over the entire surface, or, by using a mould covered with some substance that is a good conductor of electricity, we can obtain a perfect copy of it in the deposited metal. This electrical deposition of metals has become a very large and important industry. By means

BURNETT'S

PERFECTLY
PURE
Standard — Flavoring
HIGHLY
CONCENTRATED

EXTRACTS

of it we can cover the cheaper metals with a brilliant and unoxidizable coating of gold, silver, nickel or any desired metal. Nearly all the plated ware in use is made by this process, the practical details of which may be of interest. In plating with silver the liquid used is a solution of chloride of silver in cyanide of potassium. A large vessel is filled with it, and the article to be plated suspended in it from a copper rod laid across the top and connected with the negative pole of the source of electricity. To a second copper rod, connected with the positive pole, plates of silver are attached and also immersed in the solution. As the silver is deposited at the negative pole, more silver is dissolved from these plates by the acid set free at the positive pole, and thus the strength of the solution is kept constant. It is necessary to clean the article very carefully before immersing in the plating solution, as the slightest trace of dirt or grease would interfere with the regular disposition of silver and render the work imperfect. This is effected by numerous scourings, brushings and dippings into acids and alkalies. The source of the electricity was formerly the galvanic battery, but the recent improvements in electric dynamo machines have rendered them especially applicable to this work, and they are rapidly supplanting the old-fashioned voltaic cells. When everything is ready, a very strong current is sent through the plating solution, for the purpose of quickly depositing a thin layer of silver. This process is called "striking," and after it is effected a weaker current is used and the silver deposited more gradually. The current is continued until the required weight of metal is deposited, according to the thickness of the plate desired. An ingenious arrangement is in use by which the articles to be plated are suspended from one arm of a balance which forms a part of the electric circuit. The balance is weighted according to the amount of silver desired, and as soon as it is deposited the beam turns, breaking the circuit and stopping all action at once. When the plated articles are first removed from the solution they do not show the familiar lustre of silver, but the finely divided metal upon their surface gives them a dead white appearance like porcelain. This is easily removed by polishing and burnishing wheels, and the bright "electro-plate" is ready for the work of the engraver or decorator. Gold and nickel plating are done by practically the same process. A solution of chloride of gold in cyanide of potassium is used for

THE superiority of these Extracts consists in their PERFECT PURITY AND GREAT STRENGTH.

There is no subject which should more engross attention than the purity of the preparations which are used in flavoring the various compounds prepared for the human stomach.

They are not only true to their names, but are prepared from fruits of the best quality, and so highly concentrated that a small quantity only need be used.

JOSEPH BURNETT & CO., Boston, Mass.

gold plating, and a small plate of gold instead of silver is suspended in the solution at the positive pole. Nickel plating is a more recent invention, but is effected in the same way, and has become an immense and profitable industry. It is equal to silver in beauty and brilliancy, and has superior resistance to those impurities in the air which tarnish and discolor the more expensive metal. Electrotyping is a modification of the same process, by which any number of reproductions of a "form" of type can be obtained in a solid block of metal, thus saving the wear of the type and allowing it to be distributed and used for other work. After the type is set up into a "form," a wax mould is taken of its surface. The face of this mould is dusted with finely powdered graphite or black lead, to render it a conductor of electricity, and it is then suspended in a solution of sulphate of copper, so as to form a part of an electric circuit. Metallic copper is deposited upon the face of the wax mould, giving a perfect reproduction of the original form of type, and when it has reached the requisite thickness it is removed, strengthened with a backing of type metal and mounted upon a block of wood or metal ready for use in the printing press. This process is a very cheap one, and where a large number of copies are to be printed prevents the rapid wearing out of the expensive type. Wood engravings are always printed from these electrotype reproductions, as the soft wooden block would be rapidly destroyed in an ordinary printing press. In the process of stereotyping, the plates are cast directly in type metal from a mould of the original type in plaster of Paris or paper pulp, but, except in the case of daily newspapers, or for inferior work, the electrotype process has nearly superseded it. —Pop. Science News.

STEEL SPIKES.—A New Castle (Pa.) dispatch says that a series of experiments were tried at the Etna Iron Works on January 7 in the manufacture of steel railroad spikes. The object is to make a finished article by rolling the bar so that its width will be the length of a spike and in such a shape that the spikes may be cut from it with shears, pretty much as a cut nail is made, except that the head is formed in the rolling process. The first test was made by running through some steel rails that had been slowly heated for two and a half hours. The result was fairly successful, and it is thought that a few changes in the rolls will make the operation entirely satisfactory. Should the scheme be successful, it will work a revolution in the cost and manner of making railroad spikes.

LACTOPEPTINE.

The most important remedial agent ever presented to the Profession for Dyspepsia, Vomiting in Pregnancy, Cholera Infantum, Constipation, and all Diseases arising from imperfect nutrition.

Lactopeptine precisely represents in composition the natural digestive juices of the Stomach, Pancreas and Salivary Glands, and will, therefore, readily dissolve all foods necessary to the recuperation of the human organism.

CAUTION

We regret that we are compelled to caution the profession in prescribing Lactopeptine, but very careful investigation has proven to us clearly the necessity of it. Substitution of cheap and worthless compounds are being made in many cases where Lactopeptine is prescribed.

Lactopeptine is always UNIFORM, and its effects are SPECIFIC, and no one has ever been able to imitate its digestive value. If you do not obtain positive results when you prescribe Lactopeptine, you can be sure that some substitution has been made, and in such cases it may be necessary for the physician to prescribe Lactopeptine in the original ounce package to insure certainty of obtaining the genuine article. We can confidently make this assertion, knowing the scrupulous uniformity in digestive value of every ounce of Lactopeptine.

Lactopeptine has always been kept strictly in the hands of the Medical Profession, never having been admitted in any publications but Medical Journals. It is prescribed by the most intelligent and educated physicians in all parts of the world, and there are but few physicians who have ever used Lactopeptine that will not agree with the late Prof. L. P. Yandell, when he says: "Lactopeptine is one of the certainties in medicine, and in this respect ranks with Quinine."

In the various forms of Dyspepsia, in vomiting in Pregnancy, and in Mal-nutrition of children, there is no known remedy so positive in results.

AN EVIL AND FOOLISH LAW ASKED FOR.

LEGISLATION SOUGHT TO ENABLE BUTCHERS TO SELL
POOR MEAT AT HIGH PRICES.

AN ACT

*For the better protection of local producers of, and dealers
in, iron and steel.*

"It is hereby enacted that, on and after the passage of this act, no iron or steel shall be sold, or offered for sale, within the State of New York, that has not been made from ore produced in the State of New York, and inspected and approved at the place of its reduction and conversion, which shall have been within the State of New York, by local inspectors who shall be appointed by the Boards of Supervisors of the respective counties in the State of New York."

LOOK'S RIDICULOUS, DOESN'T IT?

But it would not be any more absurd, antagonistic to the public interest and unconstitutional, than the fool law that a certain organized gang of local butchers are now exerting themselves to have enacted by each of the legislatures of the Eastern States. What a splendid thing such a law as that would be for owners of iron mines in this State! and for local manufacturers and dealers in iron and steel, who could then fix prices just to suit themselves! and for the inspectors, who should of course have good salaries! Every argument used by the advocates of the proposed law to compel local inspection, on the hoof, of all animals to be slaughtered for food, would apply with equal force in favor of such a law to limit and control our supply of iron and steel. And every consideration that would brand as wickedly injurious and unwise such a sweeping measure for the benefit of local iron men, stamps as a like character the pernicious bill for the selfish profit of the butchers.

In the interest of consumers, we protest against such outrageous legislation; and, that there may be no misunderstanding of the character of the measure, and the inevitable consequences should it, through almost inconceivable unwisdom of legislators, anywhere become a law, we propose to state clearly the facts involved and to expose the false and fraudulent pretences employed in its advocacy.

A large portion of the meat now sold at retail in all parts of the country is slaughtered in Chicago and supplied by refrigerator cars to the various points where it is required for local consumption. In this there are several very great advantages. Chicago is one thousand miles nearer to the natural sources of beef supply than is the Atlantic seaboard. Beef is specified, because that is the main thing over which the present fight is made. As merely an economic measure, it is manifestly wisest to convert crude material into a manufactured article, as in the transformation of a live steer into dressed beef, at as near a point to the place of production of the crude

material as is practicable, with due reference to facilities for the process and for marketing of the product. The Southern Californian ostrich grower, who should send his birds by rail to New York to have their plume feathers clipped for the market, and then haul them back to his ranch to grow more plumes, would probably be looked upon as a new and surprising kind of idiot. But he would be little worse than the man who would see it a good business-like proceeding to pay heavy freights on unnecessarily hauling for a thousand miles the offal and other almost valueless material of a live steer. But there are other considerations, more important than economy, against the transportation of the living animal to any greater distance than is absolutely necessary. Long travel exhausts the animals greatly, causes them to lose weight to a surprising degree, and induces such fevered conditions as render them exceedingly unsuitable for human food unless they can have, for rest, quiet and recuperation, far more time than the interest or even the business necessities of slaughterers in the East could ever allow them. Several days are always allowed in Chicago for animals coming from Iowa, Kansas, Nebraska, Texas, and other points of supply in the West, to regain their normal condition before they are slaughtered, and that although they are transported in "stable" cars, under such conditions of care for their comfort as were entirely unknown prior to the establishment of the great "dressed beef" industry. But were one thousand miles more of travel to be endured by them, they would at the end of the journey require weeks instead of days to recuperate, which of course could not, or at least certainly would not, be given them.

The business necessity for protecting the enormous capital invested in the "dressed beef" trade is of itself a sufficiently powerful consideration to compel those interested in it to the employment of every possible safeguard. They have made their trade by the thoroughness of their system and the consequent excellence of the meat they have uniformly supplied to their many thousands of consumers. And upon the maintenance of that standard of quality, together with their reasonable prices and reliability of supply, depends their continued success. How absurd then is the mendacious howl of the Butchers' National Protective Union, that "Chicago dressed beef comes from poor and diseased animals." Even if the "dressed beef" men were rascals, they would not dare to imperil their large interests by the petty dishonesty of supplying poor meat instead of good to their customers. Naturally, the profit in such substitution suggests it as a tempting business idea to the Association, and their mouth, Mr. Brokate, may possibly be unable to comprehend why it would not commend itself to others. But the dressed beef men would have to be fools, as well as knaves, to resort to it, and their present position sufficiently demonstrates that they are far from being fools.

There are in active competition in Chicago four large concerns, engaged in the dressing of beef for the general market, and they buy their cattle from no less than ninety-one competing commission firms and dealers in cattle, who are all in business at the Chicago Stock Yards. For the protection of its millions of dollars invested, the Stock Yard Association is necessarily extremely rigid in requiring careful inspection of all cattle received there—as all reaching Chicago must be—and the rejection of such as are in the slightest degree unfit for food. The competition between the sellers of the live cattle enables a still further sorting out of all that are not of absolutely the best quality. Finally, the rivalry between the dressed beef firms carries selection to the extreme point, beyond all that is practicable in dealing with the living animals, to the careful inspection of the meat before it is shipped. At the stock yards are three skilled inspectors, not selected for their political "pull" and "influence," as the horde of local inspectors contemplated by the butchers' bill would inevitably be, but experienced and conscientious men who know all that is to be known of their business and are

inflexible in the discharge of their duty. Every animal that passes through the stock yards must have their approval or it can only be utilized for hide, tallow and fertilizing material. Then the dressed beef firms employ as buyers men in whom they individually have confidence as even more exacting judges than the official inspectors are. And yet another inspector is employed by each firm, whose special scientific skill is in the detection of disease or other unworthiness in meat, and every individual quarter of dressed beef must pass under his carefully critical examination on its way from the refrigerating rooms to the car upon which it is to be shipped to consumers; and if it is not above all question he condemns it and sends it at once to be made into fertilizer. The Mouth, already referred to, speaking for the B. N. P. Association, has affirmed loudly that the great reason why they demand the local inspection of live animals is because it is impossible to tell if dead meat is from an inferior or diseased animal or if it is not. But that is a foolish falsehood. The quality of meat and the diseases that may have affected it during life can only be told with accuracy when it may be critically studied as dead tissue. Indeed, specific maladies of the most serious nature as affecting the food value of the meat can be told in no other way. Can the *trichine spiralis* be discerned in the grunting porker? Decidedly not. It is only when his flesh can be got at with the scalpel and the microscope that his infesting myriads are discoverable. So, too, with other dangerous germs sometimes concealed in animal tissues. In fact there is no disease that renders an animal unfit for human food that does not leave its traces or its bacterial causes in the flesh and easy for demonstration after death. As for not being able to tell merely poor, stringy, juiceless or tough meat after it is dressed, from meat that is in all ways good; well, every intelligent housewife ought to be able to do that. And that the intelligent housewives, and meat eaters generally, do exercise such discrimination, and consequently prefer Chicago dressed beef to the sort of meat the B. N. P. Association would like to be able to restrict them to, is just what inspires the butchers' howl for a protective law against competition.

And this brings us to contemplation of another "nigger in the woodpile," or, in other words another reason that the butchers have for antagonizing so bitterly the dressed beef industry. Before this system of supply was established, a proportionately few local butchers, in each town and city, had practically a monopoly of their business, and were enabled to hold prices up at any figure they pleased. An enterprising fellow might have the good idea of building up a business for himself by charging a little more reasonable figures than they chose to maintain, still ensuring himself a fine profit, but if he attempted it, a concerted movement by his rivals would compel the slaughterers to cut off his supplies of meat. He might get it from a distance, but added cost and inconvenience would make that a losing game. He might, if rich enough, slaughter on his own account, but the disproportion of cost to product in hauling such small numbers of cattle as he only would be likely to require, the loss on "rough meat," lack of facilities for economic utilization of the offal, etc., etc., would altogether put him at such great disadvantage that success would be improbable, if not impossible. And, if necessary, they could afford to undersell him long enough to break him. But, introduction of "dressed beef" has knocked the bottom out of that tub in which they so gaily swam. Now, with this source of supply, a man with a small capital may enter into competition and be always secure of having a supply of the very best meat, in perfect independence of the established butchers and the local slaughterers they control. Thousands of small butcher shops have been started in this way to the great convenience and advantage of the public, that would have been simply impossible but for the Chicago dressed beef supply. And this, to the would-be monopolists, is a thing most horrible and not to be endured." So grievously do they feel it that they want

a law passed to forbid the continuance of such a state of affairs. In effect they say to the community: "Have some consideration for us; tie your hands in order that your struggles may not interfere with our picking your pockets."

A fallacious argument with which the butchers are seeking to beguile the rural members of the Legislatures into supporting the mischievous law they beg for is, that by excluding the dressed beef from other States a greatly increased demand for locally raised beef, at advanced prices, will be compelled. If the gentlemen from the rural districts will ponder upon the situation as it is and the consequences of excluding competition from this field, they will hardly be so easily deceived as the butchers hope to see them. It needs no argument to demonstrate that cattle can be raised on the vast grassy plains of the far West—where land is comparatively valueless, and winter-feeding, if resorted to at all, is a mere trifle compared to what it necessarily is in the East—at far less cost than they can anywhere in the Eastern or Middle States. And, with the improvements in stock that have been made in the West in late years, there is now no such difference in the quality of the cattle raised there from those grown in the East as will offset in the market, in favor of the latter, that greater cheapness of production of the former. Now, is it rational to imagine that these butchers, when they have the protection of a law that shuts out all competition from abroad, will, for any sentimental regard for the Eastern cattle raiser, pay to him five or six dollars per hundred for cattle—which is as low as he can afford to produce them—when they can buy Western steers for three dollars per hundred? Of course not. The astute butcher will buy where he can get the cheapest and will take care to sell the dearest that he can. What will it matter to him if the Western cattle have, even when they started, been inferior to the Eastern? or, that his absolute control of the market has enabled him to force down prices so that the Western cattle-grower is compelled to send on his animals in the cheapest way possible, and, consequently, in the worst condition for food when they reach the local slaughterers? Those are considerations that it may amuse the consumer to reflect upon, but they cannot concern the lordly butcher who leans his back against the "no competition law, and, slapping his paw upon just the kind of meat that it pays him best to sell, offers the alternative: "This, or none." He would very probably sell less meat, but in the increased prices that he would be able to command from those who could afford to pay and would endure his yoke, he would find equally large revenues and with the advantage of having to carry less invested capital in his business. If now he complains and cries aloud for protection against competition when he sells for \$93.12 a 750 lb. carcass that cost him \$52.50, what in Heaven's name will he be satisfied with when he gets the law he is after? And the Eastern cattle-grower need not be deluded with the hope of an export trade keeping a good market open for him. Without the large field of consumption afforded by general sales throughout the country, it would not pay to carry on the business of dressing beef for the export trade alone; particularly when the impression became general abroad that our beef was so universally bad that each State had to pass laws to protect its citizens against the pernicious beef of all other States.

All that we have said is exactly and literally true. There is absolutely no consideration whatever for the interest of consumers, or of Eastern cattle-growers behind the urgency that is pushing this rascally measure before the several Legislatures at the present time. It is to serve nobody but the grasping and conscienceless butchers, who having failed in all other endeavors to exclude dressed beef from the market by misrepresentations and calumnies, now hope to attain their end by a law that under the shallow pretext of protecting consumers by requiring inspection of live animals at the place where they are slaughtered, in the State, shall re-establish their old-time monopoly. It is hard to con-

ceive how any honest man, not a jibbering idiot, could vote for the enactment of such a law.

It is not important of consideration from our present standpoint—which is simply the advocacy of good food material at reasonable prices, in the interest of consumers—but it is at least worth mentioning, that the appointment of the horde of inspectors necessary to carry such a law into effect would impose a heavy burden upon the already over-laden tax-payers, and that as these inspectorships would inevitably be rewards for political services rendered, or inducements for services to be rendered, neither capacity nor integrity of the highest character could reasonably be expected from the incumbents.

Happily the enactment of such a law would be little likely to have any other permanent effect than its erection as an enduring monument to the foolishness of those who voted for it, as its unconstitutionality would speedily be declared by the Supreme Court. No State has the power to enforce laws interfering with interstate commercial rights or to discriminate injuriously against, proscribe and exclude the products of other States. That sort of thing has already been tried by several Western and Southern States, and even by municipalities, in the imposition of enormous license fees upon commercial travelers, but the supposed right to fleece those enterprising missionaries of trade has been declared unconstitutional and the claim to it has been abandoned. Could such laws be enacted and enforced, the vistas of possibilities, in the way of retaliatory legislation by the several States against each other and the legitimate evolution of the system into each city and town lifting its Ishmaelitic hand against its neighbor, would be simply dazzling. Pass that law in New York State and it would shut out at least half our supply of meats, which come from New Jersey and Connecticut. Would not New Jersey be justified in promptly establishing a custom-house of her own at each ferry and imposing a tariff on everything sold over there by New Yorkers? Her interstate tariff would be no worse than our anti-competition-in-beef-supply law. And it would not be without precedent. The States of Venezuela impose taxes upon each other's products. So do some African tribes adjacent to each other, it is said. Tariff is a great thing. Once begin applying it and, as DeQuincy said about murder, "There is no knowing where you will stop." And after New Jersey had set the example—or rather followed ours, should we be able to have that law—why wouldn't Jersey City protect itself against Hoboken, and both against Weehawken, and all individually against the Hackensack melon growers?

Seriously; the proposed law is an exceedingly bad one, urged only for selfish purposes, inimical to the interests of all the community except a small class who deserve no such favor, would be unconstitutional if enacted, and it is to be hoped will be overwhelmingly defeated by every State Legislature before whom its audacious inventors have the impudence to bring it.

If we make any change upon the system that exists now, let it be by the institution of governmental inspection. It is not probable that inspectors appointed by the general government would do the work any more thoroughly than it is now done under the compulsion of commercial interests, but their creation would meet all possibly honest requirements for official inspection of the dressed beef for home consumption in all the States, and would no doubt have a beneficial influence abroad as offering an assurance there that would be of value in lands where everything "official" commands peculiar respect. The employment of national inspectors would not interfere with established business interests or weaken the now healthful activity of competition which is, after all, the best safeguard of the consumer. By all means let us then have national inspectors, but, be bothered no more by these mendacious and fraudulent advocates of so unwise and injurious a scheme as that now thrust upon the consideration of our State Legislators.

ORANGE CULTURE.

HOW THE CROP IS RAISED AND DISPOSED OF IN FLORIDA.

Marion County, in the centre of Florida, is celebrated for producing one-fourth of the orange crop of that State. It has large groves of natural growth situated in the midst of rich hummocks, those adjacent to Citra, its principal shipping point, covering over 2,500 acres, and containing 75,000 full bearing trees. J. A. Harris, a resident of this district, and known throughout the State as the "orange king of Florida," has been visiting New York, and furnishes some interesting data to the *Tribune* concerning the cultivation of this and other fruit. He said: "Marion County will furnish over half a million boxes of oranges this year, or more than any other three counties put together. The crop of the State averages from two and one-half to three million boxes. The majority of the groves are of spontaneous growth, and stand just where nature planted them; hence the fruit, being of wild origin, is sour and bitter. This stock is the best to graft upon, and when budded to the best sweet varieties the new wood is all sweet above the graft and produces the most luscious fruit, a tree taking three to four years to bear. I was born and brought up at Lake Harris, and when at the age of twenty-two I moved to Citra and bought a grove, the country was a wood, boasting one pine cabin and four inhabitants. All of the oranges were of wild growth and consequently sour, so I grafted them and made them sweet, studied the nature of the fruit, kept the ground clean and well-fertilized, and for eighteen years have diligently pursued the business, and as a result my grove of 200 acres this year yields 50,000 boxes of oranges, which is greater than the yield of any other grove in the State. Bishop, Hoyt & Co., my neighbors, have a grove of 175 acres and are the second largest, and the Lindsay or Crescent Orange Company, also in this district, are the third largest growers. At Citra we confine our labor to men as far as picking, packing and shipping are concerned, but boys do the wrapping, and at some groves girls also assist at wrapping. The wages of the men average from \$1 to \$3 a day, yet as they do the bulk of the heavy or outdoor work they, as a rule, command the latter figure, the boys earning all the way from 50 cents to \$1.25 a day. The busy season begins in November and lasts until April. The force is about equally divided between the colored and white people, the former doing the picking and the latter the packing and shipping. What do they do during the remainder of the year? Why, new groves have to be laid out, land cultivated, weeded and kept clear to prevent the trees from becoming diseased, and this takes all summer. This, of course, does not require as many men as during harvest season, still there is always plenty of work between opening up the new and keeping the old groves in proper condition. Some of the hands hire out on farms, orchards, cotton, tobacco or sugar plantations. You ask if many bananas or pineapples are grown in this district. Only a few, for table use. At Indian River, further south, bananas, pineapples and cocoanuts, which are largely tropical or open-air plants, are grown extensively. Oranges are more profitable to us, and next to them limes, lemons, citron and grape fruit. By the way, tobacco growing is attracting great attention and becoming a considerable industry, especially the finer grades, which flourish on hummock land, and in quality are equal to any brought from Cuba. Speaking of the fruit culture in Marion County, it has only one drawback, namely, lack of water. April and May being the dry season, the young fruit drops off; hence, there is some waste, and an improved system of irrigation is needed. Wells have been sunk successfully along the Atlantic coast and St. John River, but in the interior, although borings have been made to a depth of 1,000 feet, the flow of water is insufficient for practical purposes. The only disease prevalent is that of scale insects of many kinds, which sap the life out of

the fruit, but by keeping the trees well trimmed, and the land clear and well fertilized, the business cannot fail to be successful. Of one thing I am strenuously in favor, and that is confining our shipments to one or two Eastern markets, where all consignments would be sold at an exchange. This would guard against an overstocked market and the loss incidental to perishable goods, and the advantage gained would be this, at least, that goods would sell on their merits, and prices could be regulated. Citra has now 500 inhabitants and ships 250,000 boxes of oranges annually, and in other portions of the county there are numberless groves that ship from 100 to 10,000 boxes of the fruit with the return of every season."

DOMESTIC DIETETICS.

SPECIALLY PREPARED, FROM PRACTICAL TESTS, FOR THE LADY READERS OF THE "AMERICAN ANALYST."

SEASONABLE FOOD.

March.

MEATS.—Beef, mutton, ham, kidneys, liver, venison, sausage, veal.

GAME AND POULTRY.—Grouse, hare, pigeon, chicken, duck, turkey, goose, snipe.

FISH.—Bass, cod, snipe, eels, carp, catfish, flounder, halibut, herring, lobster, mackerel, mussels, oysters, perch, pike, rock-fish, salmon, smelt, whitefish, trout.

VEGETABLES.—Artichokes, beans, carrots, celery, garlic, lettuce, onions, parsley, parsnips, potatoes, shallots, spinach, turnips, water cress.

FRUIT.—Apples, bananas, oranges.

PRACTICAL RECIPES.

BLACK BEAN SOUP.—Soak one pint of black beans over night, then put them with beef bones or a small piece of lean salt pork into three quarts of water. When they have boiled three or four hours strain, and season with salt, pepper, cloves and lemon juice. Add, when ready to serve, some thin slices of lemon and hard-boiled eggs. Serve with dice of toasted bread.

OYSTERS ON TOAST.—Two dozen oysters, two tomatoes, one small onion, one-half lemon, two or three ounces of butter, parsley, cayenne, salt. Chop the onion and fry it in butter, add the pulp of the tomatoes with the seasonings; cook briskly for ten minutes; add the oysters and thicken slightly with half a teaspoonful of flour, simmer for ten minutes, add the juice of the lemon and the butter and pour over well browned toast. Serve at once.

DOUGHNUTS.—One egg, one cupful of milk, three pints of flour, one cupful of sugar, three teaspoonfuls of Horsford's baking powder. Mix; roll out, cut and fry in boiling lard.

APPLE TAPIoca PUDDING.—Soak one cupful of tapioca in three pints of cold water over night; put it on to boil twenty or thirty minutes, or until it looks clear; then add a quart and a half of pared and quartered apples, one cupful of sugar, one teaspoonful of salt, and essence of lemon. Now put it into a buttered dish, and bake an hour and a quarter. Serve, when cool, with sugar and cream.

POTATOES FOR BREAKFAST.—Peel the potatoes and slice them thin; cover with a little water, so little that it will evaporate while cooking. Add salt and pepper to taste, and cream, or a little milk and a lump of butter.

LEMON TARTS.—Two lemons, two ounces of ground almonds, two ounces of grated bread crumbs, two ounces of suet, six eggs, four ounces of sifted sugar. Squeeze the lemons and grate the rinds, strain the juice and add the almonds, bread crumbs, suet and eggs,

yolks and whites beaten separately to a snow, with sugar. Make a light puff paste around the dish, and bake in a quick oven.

PEPPERMINTS.—Two cupfuls of sugar, one-half cupful of water; boil five minutes. Flavor to taste with peppermint; stir until thick, and drop on white paper, well buttered.

THE STATE INSPECTION LAWS DEFEATED.

TRUTH, COMMON SENSE AND JUSTICE PREVAIL.

One of the unfailing signs of defeat is always what the boys in play call a squeal. The boy playing marbles, when he loses, is sure to accuse his playmate of cheating, and to the casual observer of their play this plainly tells who is getting worsted. Just so it is with the few Eastern meat dressers, live stock men and professional agitators, who have been assiduously trying to convince the legislators of the various States that the only way to prevent their constituents from being poisoned by diseased meat is to pass State inspection laws which would rule out all beef killed and dressed in other States. The arguments used were many, and apparently unanswerable. The retail butcher was the first and most important consideration. He was told that he must not sell any Chicago beef, because he would only become a meat cutter for the big four, besides that he was injuring his home interests; but the fact that the retail butchers under such State inspection laws could not sell any beef outside of their own State was carefully concealed. Next the poor workingman had his attention called to the fact that if he bought Chicago meat he would take the bread out of the mouth of his local fellow workman, whose work at butchering would not be wanted if Chicago labor was supported; and in this case again studious care was taken not to tell him that if it were not for Chicago beef meat would quickly become an unknown luxury in his household. Then the general consumer was appealed to with the old and much worm-eaten chestnut that all Chicago beef was unhealthy, and that the only safeguard for the health of wife and children was an inspection of the live animal. Here again no mention was made of the greater difficulty of discovering diseased meat in the live animal than in the dressed meat. The picture of the average political heeler appointed as meat inspector, auscultating and percussing a cow to see if she has tuberculosis, is too funny in imagination even. The next subject for persuasion was the farmer, or, as these political tricksters always call them, the producers and wealth-getters of this great agricultural country. He was told that if the Chicago monopolists could only be stopped there would be a fortune in cattle raising. There would be no more hard ploughing, sowing, cultivating and reaping. All a farmer would have to do is to raise a calf, then a cow, and in a few years he would be the happy owner of herds upon a thousand hills, all of which the local butchers would be compelled to come to him, almost upon their knees, to buy at his price. The fact that cattle can be raised on the Western plains and shipped East at much less cost was entirely hidden from view. Last of all, the legislator was told in a sort of threatening advise that, aside from all the economic views of the question, which needed no argument, the votes of all these combined interests would heavily outweigh the few votes controlled by the big four. All these nicely-conceived schemes, based on one-sided and fallacious logic, might have worked very well if there had been no one to throw a little bright light on the "ways that are dark and tricks that are vain" of these conspirators. Very naturally the Chicago beef dressers, seeing these selfish men try to injure their business, started out in the only manly, open and above-board business like way open to them. They stated the case frankly and truthfully, and submitted it to the people of the United States through the best channel, the public press. Everybody read the facts *pro* and *con*, made up

their minds, and the universal verdict was in favor of right and justice. The legislators saw this as well as others, and it resulted in an overwhelming defeat for the conspirators. These State inspection laws were squelched. At first the two or three sheets who claimed to be the mouthpieces of the conspirators howled themselves hoarse over the assured defeat of the Chicago monopolists. Then they gradually lowered their tone until now they have come down to a puny whine, and ascribe their defeat to the improper use of money, bribery of their several legislatures, and, in fact, to any cause but the right one, namely, that they had not justice nor common sense on their side. The man in Albany who tried to engineer this bill through is named Slaughter. His name fits his fate to a nicety. He and his bill were slaughtered. The leading movement, in this interest, is yet to be heard from. It is the meeting of the Governors in Topeka on March 12th. If it amounts to anything more than that of the three tailors of Tooley Street, it will only result in the same old and well-known harmless saying of the Governor of the North State to the Governor of South Carolina, and probably that is what the meeting is really called for.

AERONAUTIC MOTORS.—M. Trouve has constructed several small and extremely light motors of the Gramme and Siemens type, in order to carry out some aeronautic experiments. One of these motors, while only weighing about three ounces, is capable of developing .026 brake horse-power. All the parts of the machine are of aluminum with the exception of the magnets. This motor, which could be contained in a box 1.2 inches each way, is able to lift itself twenty-five yards a second by means of a wire and a fixed support. A one-horse power constructed on the same lines would weigh barely eight pounds. When furnished with a light screw, and attached to the arm of a balance, the motor is able to lift its whole weight, when connected with a source of electric energy equal to forty watts. In order to facilitate his experiments, M. Trouve places his motor at one end of a long lever capable of a vertical and horizontal movement about its centre, the electrical connections being made with the motor through the lever and its supports.

PUBLIC MEDICAL LIBRARIES.—In the proceedings at the reception given to Dr. Oliver Wendell Holmes on the occasion of his presenting his library to the Boston Medical Library Association, Dr. R. M. Hodges, president of the association, gave some facts regarding the public medical libraries of this country. "First," he said, "in point of time, is the library of the Pennsylvania Hospital, founded in 1760; second, that of the College of Physicians in Philadelphia, founded in 1788; third, the New York Hospital Library, in 1796, etc. Of course, the library of the surgeon-general's office has surpassed in size all these, having a large annual appropriation and a magnificent librarian. Next in rank comes the library of the College of Physicians; next, that of the Academy of Physicians; and our library comes fourth in rank. After that come the Medical Department of the Public Library of Boston, and the New York Hospital Library. In other words, although the youngest of the seven libraries, ours has already passed three of them. We have nearly twenty thousand volumes."

DANGER IN THE POSTAGE STAMP.—The *Sanitary News* calls attention to the fact that a postage stamp may in various ways convey contagion. One of the simplest and most plausible is that in which a postage stamp, partially attached to a letter to pay return postage, is sent by a person infected with some disease to another person. The disease is transferred, in the first place, to the adhesive stamp through the saliva, and in being attached to the letter by the receiver the poison may be transmitted to him in turn through the saliva. Another cause may be the infection of the stamp with disease germs. The stamp, having been exposed in a room where a diseased person lies, may become slightly moistened, and thus retain the germ. That this is true can be proved very simply by a microscopical examination. We often see a person holding change for a moment in the mouth, probably not knowing that investigation has shown that disease germs can be carried by money. If one could see through what hands the money has passed, he would hesitate before using such a third hand. Silver money is as bad as paper money; but, while many would hesitate to hold a dirty bank-note in their mouth, they think that a silver piece, because bright, is apparently clean.

DOCTORS ADVERTISING.—The Board of Health of Illinois a few months ago revoked the license of H. G. Wildman, a physician, the chief charge being that he had overstepped the ethics of the profession by advertising his success and skill in newspapers. Dr. Wildman then appealed the case to Gov. Oglesby, and he rendered his opinion a few days since, reversing the decision of the Board of Health, and claiming that a physician should not be debarred from practice because he advertises what he can do and has done. Dr. Wildman expends over forty thousand dollars yearly in advertising in papers all over the Union, and several of the Illinois papers went on his bond in the action.

SCARLET FEVER POISON.—The *Medical Era* relates the case of a girl aged about eight, living at Fortress Monroe, Va., who was some months ago attacked by scarlet fever, the disease running a typical course. For a long time no possible source of contagion could be discovered. The child had not been absent from home, had been with no one lately exposed, and no other case was known to exist anywhere in the vicinity. Subsequently Dr. Brooke learned that one of the house servants had nursed a case of scarlet fever in a distant city just about a year before. After the case terminated, she packed some of her things, including some clothing then worn, in a trunk and left the place. A year later she had the trunk sent to her, opened it and took out the contents, the little girl being present and handling the things. Very soon after, the latter was attacked, as stated.

RUSSIAN PETROLEUM.—M. De Tchihatchef, a Russian writer, asserts that the average flow of petroleum in the Baku region is 88,000 barrels per day, as against 25,300 barrels in the United States. The chief drawbacks encountered by those who have worked the Baku oil fields have been lack of transportation and want of cheap package. A railway to Batoum, on the Black Sea, opened two maritime routes to Europe, and met the first difficulty. Cars and vessels constructed to carry crude oil met the last, and enabled refineries to be built in the interior of the empire wherever fuel might be cheapest. It is confidently predicted, since the completion of the Batoum Railway, that Russian oil will displace American in European markets, and that it will even be possible for the Russian product to compete for the markets of the United States. M. De Tchihatchef points out a probable demand in the near future for petroleum to serve as fuel on the great lines of railway completed and still building in Asia.

BINDERS FOR THE AMERICAN ANALYST.

We have selected the 'Handy Binder' for binding the *ANALYST*, because of the following advantages: It is elegant in appearance, strong, durable and this new method of binding allows the opening of the pages perfectly flat, owing to the fact that none of the side of the paper is used. This method also permits the taking out and replacing of one or more papers from any part of the file without disturbing the other parts. After the file is completed it ceases to be a temporary binder, and with its contents becomes a perfectly and strongly bound book. Owing to the unusual size and strength of the linen binding cord in combination with two metallic binding strips (loops) the strength and durability of the binding is wholly unequaled by any method yet introduced. Price, sent post-paid, 75 cents. To any subscriber renewing his subscription at \$1 sent directly to this office, we will send one for 25 cents, and we will give one free as a premium for every new subscription sent to us with \$1.

BUSINESS NOTES.

HORSFORD'S ACID PHOSPHATE, FOR WOMEN.

Dr. Wm. E. Jewett, Adrian, Mich., says: "I have found it particularly useful in the nervous disorders of women."

BUFFALO LITHIA SPRINGS.

The therapeutic value of lithia and salts containing that remarkable alkali becomes better known and appreciated every day. Its singular potency in many of the more serious diseases of the kidney and bladder has given it a high position in the *materia medica*. Further than that, recent researches tend to show that in the numerous complaints which have been charged to rheumatism, gout, old age and the like, but which are really caused by the presence of chemical compounds in the blood and tissues that have not been removed by the kidneys, lithia gives to the physician a new method

of attacking an old evil, and to the patient a new avenue of escape from suffering and possible death. When lithia was found to possess remarkable curative powers, it was at first feared that the supply was too small to meet the demand from the faculty the world over. With the growth in popularity, there came a corresponding development in its supply and sources. Thus, in the United States, there are no less than thirty lithia springs of more or less value and excellence. Of these, notable instances are the famous Buffalo Lithia Springs. Their medicinal virtues were known even before the fact of their containing lithia had been discovered, and enjoyed a wide local popularity and repute. Chemical analysis showed the popularity to be founded on a substantial basis. It went further, and demonstrated these waters to be one of the most efficient and beneficent natural medicines in the world. From that time on the history of the spring has been a long and ever-increasing series of cures. Its water is as rich, powerful and sparkling as when it first attracted public attention. Its analysis to-day varies scarcely a ten-thousandth from that of six years ago. This is in marked contrast with those springs which, with increased demand upon their output, change in character and gradually lose the elements by which they were originally distinguished. The Buffalo Lithia Springs, so far as can be foreseen, will be just as potent for good to sick and suffering humanity a hundred years hence as it is at the present time. With these many and great advantages, it is no wonder that the celebrated springs have gained a cosmopolitan reputation.

REMOVAL.

Mr. W. P. Fessenden, the successful New England representative of Messrs. C. P. Moorman & Co., of Louisville, Ky., the owners of the celebrated brand of J. H. Cutter whiskies, has removed his office to No. 17 Central Wharf, Boston. With such a good article to represent, it is sometimes hard to tell whether the success is due to the excellent quality of the goods sold, the fine reputation of the home house, or the skill and perseverance of the salesman. Perhaps a mixture of all three is what does it.

THE SCIENTIFIC ASSOCIATION.—The American Association for the Advancement of Science will meet at Toronto, August 27 to September 3; the first general session to be held on August 28; the council meeting on the 27th.

LOOK OUT for Imitations and Substitutes OF *Horsford's* ACID PHOSPHATE.

A variety of imitations and substitutes of this standard preparation have appeared under the name "Acid Phosphate," or a similar title, all of which differ materially from the genuine article.

Be sure the name "**HORSFORD'S**" is on the label. No other genuine.

LEA & PERRINS' SAUCE.

Lea & Perrins', the original and genuine Worcester-
shire Sauce, has been before the public over a half a
century. Like all popular favorites it has long been the
standard of comparison and the pattern for counterfeit-
ers who not being able to imitate its excellence offer to
the public imitations in bottling, labels and style of
putting up. They dare not counterfeit the signature of
Lea & Perrins which is on the red label of every genu-
ine bottle, and of which this is a facsimile.

Lea & Perrins

To be sure of obtaining the genuine article, see that
the above signature is on the label.

SCOTT'S EMULSION

OF PURE COD LIVER OIL WITH

HYPOPHOSPHITES OF LIME AND SODA.

THE STANDARD EMULSION OF COD LIVER OIL THROUGHOUT THE WORLD.

A BEAUTIFUL CREAMY MIXTURE—ALMOST AS PALATABLE AS MILK.

Having much greater remedial power than the crude Cod Liver Oil, without any of its nauseating effects.
Its PALATABLENESS, EASE OF DIGESTION, and long tolerance by most sensitive stomachs
as well as its reliable therapeutic effect, has given it special favor with the medical Profession, and re-
ceives their unqualified endorsement and support.

Possessing as it does the tonic and stimulating properties of the Hypophosphites in combination
with the strengthening and fattening qualities of the Cod Liver Oil—gives it a remedial value in WASTING
DISEASES, ANÆMIA or IMPOVERISHED BLOOD, EMACIATION and CONSUMPTION—un-
equalled by any single or combined remedy in existence. The rapidity with which delicate children
fatten and grow strong on this palatable Emulsion, is very remarkable.

Samples will be sent free except express charges to any wishing to try this preparation. For sale by all druggists.

THE TORSION**Braided Wire Mattress.**

At all times a thoroughly ventilated and perfectly clean mattress, it cannot absorb odors, or retain exhalations or disease germs.

D. HAYES AGNEW, M. D., Prof. of Surgery, University of Pennsylvania, says:

"The Torsion Braided Wire Pillow and Mattress I regard as superior to anything of the kind now in use; well suited for either private or hospital use."

Prof. WM. H. PANCOAST, late Professor of Anatomy, etc., in Jefferson Medical College, now Professor of Anatomy and Clinical Surgery in the Medico-Chirurgical College of Philadelphia Hospital Surgeons, says:

"I have used in my surgical practice your Braided Wire, in the form of mattresses, pillows for the head and body, and short pillows for the arm and leg when injured. I find them most admirable, cool and light, yet affording perfect and elastic support."

I have saved a patient from bed sores by the use of the Braided Wire mattress."

WM. H. FORD, President Board of Health, Philadelphia, says:

"I have used the Torsion Braided Wire Mattress with great satisfaction, it is light and therefore easily handled; it is elastic and very comfortable. The case can be easily removed to afford a complete airing, a feature of great importance from a health point of view. It is an invention of great usefulness."

WORK · CAMDEN, N. J. ·

LADIES HOME COMPANION

Now in its 16th year, well established, tried and true, as attested by a constituency of over Three Hundred Thousand Readers. The publishers, desirous of extending its influence into half a million homes, offer

3 Months Trialfor **Only 10 Cents** (Silver or Stamps.)

10 cents will secure 6 NUMBERS of this charming periodical (all different), each copy equal in size, quality, amount of reading matter, etc., to other illustrated papers that cost 10 cents a copy or \$4.00 a year.

The LADIES HOME COMPANION stands without a peer in literary excellence, typographical beauty, suggestive illustrations and helpful advice for every department of home life. It is beautifully illustrated, and printed on fine, cream-tinted paper, and has a more brilliant array of contributors than ever before, consisting of

8 Regular Editors and Scores of Eminent Writers,

Whose facile pens will furnish **Short and Continued Stories** of absorbing interest, while all branches of household economy that can possibly come within the good housewife's province will be ably treated.

PRACTICAL HOUSEKEEPING. This department is a well-spring of valuable suggestions for every branch of housekeeping, including a large variety of tested recipes, and how to prepare them at the least expense, in dainty and appetizing forms; also, hints for table decorations, methods of work, etc., and much practical information, covering the entire range of household work, treated in such manner as to interest every housekeeper.

FANCY WORK. In these departments elegant illustrations and plain directions are given, showing how to make all kinds of fancy work, embroideries, needlework, crocheting and knitting; also suggestions for ornamenting Parlors, Bedrooms, Dining-rooms; arranging and Decorating Furniture, Curtains, etc., so that homes may be adorned with taste, and made attractive with little or no outlay. Instructions will also be given that will enable any one to make many useful and ornamental articles, such as Wall-pockets, Brackets, Fancy Leather-work, Work-boxes and baskets, Fancy Work with Leaves, Flowers, Grasses, etc.

FASHIONS, OR, WHAT TO WEAR AND HOW TO MAKE IT. Artistic illustrations are always found in this department, with descriptions of the newest and latest Styles and Novelties in Ladies' and Children's Dresses, Hats, Bonnets and other garments, with directions that enable one to dress well and economically. The very finest illustrations are used to make everything plain, so that ladies can make their own dresses, trim their own Hats and Bonnets, and dress themselves and their children with neatness and taste, in the prevailing styles. Each copy of the Ladies Home Companion is worth more than a year's subscription to every young lady and married woman, for this department alone.

MOTHERS find the portion devoted to them invaluable, and filled with a wide range of helpful suggestions obtained from practical experience relating to a mother's duties to her children, how they should be reared and cared for in sickness and in health; also suggestions and illustrations for all kinds of children's garments and many other necessary things.

FLOWERS. The Floral Department is a treasure to the amateur florist and all who love flowers, containing much of interest to those who raise flowers, whether for pleasure or profit.

OCCUPATIONS FOR WOMEN.

Women can make money in many ways, and the opportunities for women to become self-supporting are constantly increasing. The Ladies Home Companion aims to keep women informed in reference to those things that wives, mothers and single women are doing to earn money, while in all its departments it is the most complete, most readable and

MOST FASCINATING LADIES' PAPER PUBLISHED.

So popular have our publications become that more than a million people read them regularly.

Mention this paper and address **LADIES HOME COMPANION, Philadelphia, Pa.**

A Practical
Household
Journal.

TOILET.—Recipes and hints for care of hands, face, teeth, eyes, hair, etc., color and harmony in dress, etc.

ETIQUETTE at home and abroad, at the table and on the street, at public gatherings, etc.

CHILDREN'S CORNER sparkles with interesting sketches and splendid stories for wide-awake boys and girls, while an opportunity is given to develop their mental powers by solving puzzles, charades, enigmas, etc., for which prizes are offered.

DEPARTMENT.—Rules, usages and ceremonies of good society, letter writing, good manners, the art of conversing well, accomplishments, home training.

SEASONABLE BILLS OF FARE are given, with plain directions for the economical preparation of healthful, nourishing and palatable dishes, with hints for serving, arrangement of table, reception of guests, etc., etc. Also menu for parties, teas, receptions, Thanksgiving and Christmas dinners.

PEACOCK'S BROMIDES

(SYR: BROM: COMP: PEACOCK)

NERVE SEDATIVE.

Each fluid drachm represents 15 grains of the Combined C. P. Bromides of Potassium, Sodium, Calcium, Ammonium and Lithium.

USES:—EPILEPSY, and all CONGESTIVE, CONVULSIVE, and REFLEX NEUROSES.

This preparation has stood the test of time and experience, and can be relied upon to produce results, which can not be obtained from the use of commercial bromide substitutes.

DOSE:—One to two FLUID drachms, in WATER, three or more times a day.

PEACOCK CHEMICAL CO., St. Louis.

THE VIBURNUM COMPOUND

OF

DR. HAYDEN,

THE STANDARD IN

FEMALE DISORDERS.

Employed in the leading Hospitals, and prescribed daily by the most eminent Gynecologists. *Five Thousand Physicians* have given their testimonials for **HAYDEN'S VIBURNUM COMPOUND.**

DISPENSED BY ALL APOTHECARIES.

OPIUM AND LIQUOR HABIT CURED.

WE solicit an investigation of our system and methods, and will gladly send to any one very interesting matter on the **OPIUM HABIT DRUNKENNESS** and their effects and cure. Physicians specially invited to examine, and if desirous of trying our remedies, liberal arrangements will be made with them.

THE LESLIE E. KEELEY CO., Dwight, Illinois.

is the most reliable substitute known for mother's milk. Its superiority rests on the test of 30 years use in Great Britain and the U. S. A sustaining, strengthening diet for Invalids; nutritious, easily digested, and acceptable to the most delicate stomach. Four sizes, 36c, up. Pamphlet, "Healthful Hints," sent free. WOOLRICH & CO., Palmer, Mass.

A NEW USE FOR LIQUID PEPTONOIDS.

Successfully used in Dissolving the False Membrane in Diphtheria.

A Physician writes: "In an experience of over thirty years I have never used anything to equal your **LIQUID PEPTONOIDS** as a local application with a spray. It will dissolve the membrane and destroy the diphtheretic odor in less than twenty-four hours. I use the **LIQUID PEPTONOIDS** full strength, as a spray, two or three times a day, in bad cases."

Used successfully by another physician in two desperate cases:—"I was induced to try **LIQUID PEPTONOIDS** in two very desperate cases of **DIPHTHERIA**. I think I never saw throats more heavily coated with exudate than were these, and I think I never saw it more rapidly disappear than in these cases, by frequent spraying with your **LIQUID PEPTONOIDS**."

LIQUID PEPTONOIDS can be taken by patients unable to ingest food in any other form. In *dyspepsia* and *loss of appetite* its effects are positive, its digestive properties assisting in the digestion of food taken and its peptogenic properties quickly stimulating the natural digestive secretions of the stomach.

PANCROBILIN.

Prepared (in both Liquid and Pill form) from Extract of Pancreas and Bile.

This preparation is designed expressly to increase the digestion and absorption of fats.

We believe that the fat-digesting properties of pancreatine and bile are inseparable, and that without their union in the intestinal tract but little, if any, fat would be digested and absorbed.

PANCROBILIN will be found of great service in *Phthisis* and other wasting diseases, *Nervous Prostration*, *Constipation*, *Inanition*, *Malnutrition*, *Intestinal Indigestion* and wherever there is a failure to assimilate fats.

If the skin is first wet with **LIQUID PANCROBILIN**, the inunction of oils will be greatly facilitated.

LIQUID PANCROBILIN is put up in pound bottles. **PILL PANCROBILIN** is put up in bottles holding 100 pills. The coating of the pills will resist acid digestion, when given as directed, but will be quickly dissolved in the alkaline secretions of the duodenum.

PHOSPHO-CAFFEIN COMP.

(Granular Effervescent.)

Formula for each dessertspoonful:—

Caffein.
Acidi Phosphorici aa, grains, ss.
Antipyrin.
Ext. Apii. Grav. dulc. (Celery), aa grains, j.
Sodium Bromide, grains, v.

The satisfactory results produced by **PHOSPHO-CAFFEIN COMP.** in *Headaches*, *Neuralgia*, *Insomnia*, *Neurasthenia* and *general Nervous Irritability*, are not due to the effect of any one ingredient, but to the happy effect of the combination. A thorough series of comparative tests have demonstrated the superiority of the above formula over any other in the market.

REED & CARNRICK, New York.

Tabasco Pepper Sauce

OR LIQUID PEPPER.

Is simply the Pulp of the Ripe Pepper Extracted by Pressure.

The seed of this Pepper was obtained from Central America, and by careful cultivation in Louisiana for many years has been so improved in strength, flavor and aroma, as to have become a new variety of Red Pepper, superior to all others. The pulp is so handled as to retain all the flavor, strength, aroma and color of the ripe fruit, and to keep unimpaired in any climate. It excites the appetite, promotes digestion, and is pronounced, by connoisseurs, to be the finest condiment in the world. For medicinal purposes it recommends itself by its purity, strength and diffusible form.

Manufactured by E. McILHENNY,
NEW IBERIA, LA.

For Sale by all Wholesale Grocers.

NATRONA BI-CARBONATE OF SODA.

(ABSOLUTELY PURE.)

The nature of the raw material from which NATRONA BI-CARBONATE OF SODA is made—viz., kryolith, a mineral containing *pure sodium*—insures a purity and uniformity of product which cannot be obtained from any other known material. In making BI-CARB. SODA from any other raw material, the use of sulphuric acid is a necessity, but none is used in any part of the process of making NATRONA BI-CARB.; hence its entire freedom from the slightest trace of arsenic, which is always present in ordinary soda. Its absolute purity and entire freedom from all traces of *sulphate of soda*, common salt and other impurities, render NATRONA BI-CARB. NEARLY TASTELESS, and being bolted through the finest bolting-cloth, insures the finest stage of division.

To these indisputable facts the attention of CONSUMERS of soda is specially called. They are IMPORTANT, and should influence both those who use and those who sell soda, to buy and sell NONE BUT THE BEST.

The NATRONA BI-CARB. Soda is kept in stock by almost every wholesale druggist and grocer throughout the United States, of whom it may be ordered.

Natrona Bi-Carb. Soda is unequalled by any other brand of English or American Manufacture.

PRICE BAKING POWDER CO. NEW YORK. CHICAGO. ST. LOUIS.

COLDEN'S LIQUID BEEF TONIC.

AN INVALUABLE AID IN THE TREATMENT OF ALL CASES OF DEBILITY.

Established 15 Years. Endorsed by Scores of Physicians. Essentially Different from all other Beef Tonics. Beware of Imitations.

COLDEN'S LIQUID BEEF TONIC consists of the Extract of Beef (by Baron Liebig's process), spirit rendered non-injurious to the most delicate stomach by extraction of Fusel Oil, soluble Citrate of Iron, Cinchona, Gentian and simple aromatics. An official analysis of this preparation by the eminent chemist ARTHUR HILL HASSALL, M. D. F. R. S., and an endorsement by SIR ERASMUS WILSON, F. R. S., is printed on the label of each bottle.

Its Range of Action Embraces all Cases of Debility.

By the urgent request of several eminent members of the medical profession, I have added to each wineglassful of this preparation two grains of SOLUBLE CITRATE OF IRON, and which is designated on the label as "No. 1," while the same preparation, without Iron, is designated on the label as "No. 2." It acts directly on the sentient gastric nerves, stimulating the follicles to secretion and gives to weakened individuals that first pre-requisite to an improvement, an appetite.

I will, upon application, send a sample bottle of Colden's Liquid Beef Tonic to any physician in regular standing. Please ask your Dispensing Druggist (if he has not already a supply) to order it. In prescribing this preparation physicians should be particular to mention "COLDEN'S" viz: "EXT. CARNIS. FL. COMP. (COLDEN)." It is put up in pint bottles and can be had of Wholesale and Retail Druggists generally throughout the United States.

PHILADELPHIA AND PURE FOOD.

Philadelphia has been rejoicing during the past week in a mild excitement in the shape of a Pure Food Exposition. Taken in connection with the selection during the same interval of one of her merchants as a member of President Harrison's cabinet, the City of Brotherly Love may be regarded as having experienced a combination of commotions to which its sober-minded population is not accustomed. The exposition referred to was held under the auspices of an organization of retail grocers and manufacturers. The famous "Society," who has plumed himself as being the special Philadelphia representative of pure food, was not invited to take a hand in the demonstration, owing presumably to the slur he cast a couple of years ago upon the manufacturing interests of that city in a pretended interview he published in one of the local papers. The result was that the exposition was a notable success, filling the loyal hearts of the retail grocers and manufacturers with justifiable pride, and attracting attention, according to

the daily papers, from points as remote from the scene of its brilliant operations as Pottsville and Frankford and the Falls of Schuylkill. It is gratifying to record the happy outcome of the enterprise, inasmuch as exhibitions of that kind are the most potent instruments for promoting the success of the genuine pure food movement, the practical results they induce being both effective and far-reaching. Noisy demagogues and vain-glorious "crusaders" may declaim as vigorously as they please about the prevalence of adulteration and the constant risks to which the dear, suffering public would be exposed but for their philanthropic efforts. But their vaporings are idle and go for what they are worth. The public is too shrewd not to detect the emptiness of these self-laudations, preluding, as they so notably have done, the passing around of the hat to gather in cash contributions for alleged membership in supposititious "societies." The proper method for effecting the reform aimed at is by practical illustration that appeals to the intelligence, rather than by denunciations that only create alarm and uncertainty. Let the public be educated and not merely scared. That is the sensible course which the Philadelphia merchants and manufacturers have adopted. They have tired of the effort to accomplish their end through the weak instrumentality of trade journalism, which never reaches the consumer, and which would often repel him if it did reach him. They have recognized the inefficiency of the pretended local organization, which denounces but does not reform. And they have taken the matter intelligently and vigorously in hand, with the desire to train the public mind to examine and estimate for itself the qualities of the various commodities which they offer for the delectation of the public palate. Their exposition was of the nature of an object lesson, through which we get a glimpse of the dietetic millennium, still far distant, it is true, but to which we are steadily and surely advancing.

BEEF FOR HOTELS AND RESTAURANTS.

The largest consumers of meat are the hotels and restaurants. These must use the best obtainable, and at the same time have an eye to low prices. With large experience in purchasing meat and constant care to get that quality only which will help to retain old patrons and secure new custom, the opinions of restaurant keepers on the relative quality of Western dressed meats as compared with that dressed by local butchers are valuable. We have, therefore, sought information from these men, and find that they unanimously prefer Western dressed beef, because it is the best and most tender. Without one dissenting voice, they express the opinion that it was a blessed day for them when Western dressed beef was introduced. It assured them a constant and even supply at all seasons, in any quantity to suit, without necessitating any binding agreement to take any given quantity, the material being furthermore cut to suit their varied demands. The price has also been influenced, and there is no danger of any sudden scarcity unduly inflating prices.

The quality is also much better than it was under the old system, the beef being more tender and juicy, and such a thing as tainted meat being now unknown. A few of these men who have summer establishments in localities which refrigerator cars cannot reach were particularly outspoken in favor of the Western meat, having learned by bitter experience its great advantages over the dry, tough and unpalatable stuffs supplied by local butchers. Not one could be found who would favor the enactment of any foolish law that would stop the sale of Western beef. This only confirms what we have all along said on the subject.

THE TELAUTOGRAPH.

One of the astonishing achievements of electrical science, the practical value of which cannot be definitely set forth, as it certainly cannot be over-estimated, is the invention of an instrument by means of which writing and drawing can be transmitted by telegraph. This wonderful instrument, known as the telautograph, or writing telegraph, is now receiving its finishing touches from its inventor, Professor Elisha Gray. The device consists of two current interrupters at the sending end, and a pair of electromotors at the receiving end. The sender uses either pen or pencil, near the point of which are attached two threads running at right angles to each other. These threads are kept at an even tension automatically, and each one passes to a current interrupter set into the telegraphic circuit. When the pen moves to the right, the current is broken a great number of times for a small movement. When it moves to the left, the current is reversed, and is similarly interrupted. The same arrangement prevails on the movement of the pen up and down. The writer can write or sketch as rapidly and as freely as if he had no telegraphic attachment. At the receiving end there are two electro-magnets, fitted with rods set at right angles to each other, so pivoted as to give any motion desired to the pen which they carry at their intersection. When a series of breaks in the current is caused by a motion of the sending pen to the right, the magnet draws the lateral rod also to the right. Similarly, upward motion is given by the vertical rod. Left-handed or downward strokes of the sending pen are reproduced by the receiving pen in the same manner. Consequently every motion made on the paper at one end of the wire is copied at the other end. When the pen is taken off, or a new line is begun, an automatic device operates with the same result on the receiving pen.

THE ANTIPYRIN HABIT.

The new coal tar product, antipyrin, has already started a vice of its own. This singular compound was discovered by a German chemist, and on account of its remarkable qualities is now used the world over. It has the power of reducing the temperature of the body by several degrees, and so is of vast utility in treating fevers and feverish stages of many diseases. It does

its work by depressing the action of the heart, and generally, when employed by physicians, it is accompanied with digitalis to neutralize its influence in the latter regard. Women use it partly because it is a sedative and partly because it makes the complexion beautifully clear and pale by keeping the blood away from the surface of the body. The habit, like all others, grows upon the person who practices it. It does harm, however, from the first. With women who are weak it increases their weakness; with those having a predisposition towards heart disease of any sort, it increases the tendency to a terrible extent. Besides these results, antipyrin exerts a peculiar influence upon the blood, which is not yet thoroughly understood by the faculty. It seems to undergo some decomposition or breaking down when absorbed by the system, developing unknown compounds, which either attack the blood itself or else powerfully influence the nerves and ganglia which control the vital functions.

EGG ALBUMEN.

An unsavory squabble took place at Kearney, N. J., last week when a man named Adam Gilbert was arrested on a charge of highway robbery. Until recently Mr. Gilbert, who is a German, has enjoyed a monopoly of the bad egg industry for many years, and has waxed rich amid the odors of which his neighbors complain loudly. His large cluster of frame buildings on the edge of Hackensack meadows is one of the landmarks, and there he converts eggs which are no longer permitted to enter polite circles into egg albumen for tanners' uses. Recently one of his workmen, who learned the secret of manipulating the overripe hen fruit and turning it into money, started an opposition establishment, and induced a young man named Niss, whom Mr. Gilbert recently imported from Germany, to leave his employer and benefactor and go over to the opposition. Niss was driving along the highway in a wagon belonging to Antoine Theobald, his new employer, on Wednesday night, when Gilbert ran out of his yard and seized the horse. Niss fled, and Gilbert on examining the contents of the wagon, found a large number of bad eggs in tubs, barrels and boxes. The tubs, barrels and boxes belonged to him. He seized the whole outfit, and sent word to Theobald that he could come and get his horse and wagon and his eggs, but that the tubs, barrels and boxes had been confiscated. Theobald made the charge of highway robbery. After the hearing the Justice dismissed the case. The question occurs: How much of this egg albumen is used by bakers, confectioners and manufacturers of cheap pharmaceutical preparations to go into the human stomach?

CONSUMPTION CONTAGIOUS.

In a recent number, *Science* called attention to the danger to which travellers on ocean steamers are subjected when their stateroom companions happen to be consumptives. That this danger is not an imaginary one seems to be demonstrated by an incident which recently occurred in France. A French physician, Dr. Gautier by name, has been investigating the question whether tuberculosis may be communicated by means of its bacilli. That this is possible for lower animals has been thoroughly proved. Dr. Gautier has himself fallen a victim to the disease, having become infected from the pulverized tuberculous sputum with which he was experimenting, thus showing that the disease is equally communicable to man.

IMPORTANT DECISION.—In England the Court of Appeals has just handed down its decision reversing the finding of the lower court in the Edison incandescent lamp patent case. The case had been decided against Edison, principally on the ground of insufficient specification. This last decision upholds the Edison patents, and puts the Edison Company in England in the same position that it enjoys in Germany, where the patents have been uniformly upheld.

IMMATERIAL FORCES.

SOME OF THE MYSTERIOUS PROPERTIES OF MATTER.

The universe manifests itself to us in two ways, by matter, and by force or energy. Energy is a property of matter, but we can hardly conceive of it as existing by itself apart from matter. A stone falling through the air is the same stone as when at rest, but in one case it possesses certain powers or properties which are absent in the other, and reveals itself differently to our senses, but to give an absolute definition of energy would be as difficult as to define matter itself. The chemist concerns himself with matter alone. He classifies its different forms, separates it as far as possible into its different parts, and observes and records its different combinations and their mutual action upon each other. All this is of the greatest interest and importance, but there is something beyond, and the chemist finds himself confronted with certain phenomena which have a greater or less action upon matter, although in themselves they are without weight or bulk, and are, apparently, immaterial. In the centre of our astronomical system is placed the sun, which may be regarded as a vast reservoir of force or energy, which it radiates out in all directions, a certain proportion falling upon the earth. The most familiar manifestations to us of this radiant energy are light and heat, although actinic or chemical force is also found in the radiations, and, indirectly, at least, electricity and magnetism. For a long time light was considered a natural substance consisting of infinitesimally small particles or "corpuscles" thrown off from luminous bodies. Heat or "caloric" was likewise considered a material substance, and Professor Langley, in his address before the American Association last summer, gave a most eloquent and interesting history of the gradual development of our present theories of the nature of light and heat from those of former times. Without going into details, we may say briefly that the radiant energy which reaches us from the sun is supposed to be transmitted through an assumed material substance called the *ether*, a rather unfortunate term as it has no relation whatever to the chemical substance of the same name. The energy is transmitted through this ether by vibratory undulations or wave motion, and when it reaches our earth produces the phenomena of light, heat, chemical action, etc., just as the waves of a storm upon the ocean are transmitted through the water till they break upon some distant shore, and there develop the force stored up in them. In a similar way vibrations which are apparently too coarse to be transmitted by the ether, pass through the air and produce the phenomena of sound. It must be remembered that the existence of the ether is not actually proved, and we do not yet really know how the energy from the sun and stars reaches us. The experiments of Hertz, described in the January number of this paper, are claimed to demonstrate the actual existence of a medium corresponding in its properties to the hypothetical ether, but they do not appear to us as perfectly conclusive. But whatever may be the means, we know that energy is radiated from the sun, as well as from every luminous, heated, electrified, or magnetic body, to say nothing of the more universal and comprehensive force, the attraction of gravitation, and produces the phenomena which we call by the names of light, heat, electricity, magnetism, and chemical action. This conception of radiant energy is an impressive one, and in imagination we can project ourselves into space, and, standing out of the direct path, watch the mysterious undulations as they rush by us. All about us is dark, cold, and lifeless; there is neither light nor heat, but, starting from their solar source, a continual flow of vibrations pass along to the earth. There they separate themselves into their different kinds; some to give light, some warmth, while others by their chemical action cause the plants to grow and produce food for mankind. It is as if we stood by a line of wire through which a current of electricity is passing. We see nothing, and

to all our senses it is but a simple wire; yet through it a form of energy is passing, which at the end of the line produces light, heat, power, chemical action, magnetism, or electricity, at the will of the one who controls it. How this is done we cannot say, neither can we say what the sun sends to us across the vast regions of space, which renders it possible for life to exist on the earth, or how it reaches us with no wire or other apparent means of connection; but we know that the wonderful force or forces which we call radiant energy sent to us by the central body of our system, is the foundation of all life, and the source of all the power which is produced upon this planet. Trace back every form of power in use—the steam engine, the water wheel, the windmill, the electric motor, the strength of men and animals—and we find its origin in the wonderful radiant energy of the sun. Truly the ancient sun-worshippers had a more rational system of religion than those of the heathen people surrounding them, or even some of the scarcely less heathenish systems of theology which have survived to the present day.—*Pop. Science News.*

A DELICIOUS DISH.—"Do tell me, monsieur, what this delicious dish is," said pretty Mrs. H., the star boarder. "Zat, madame, zat is a grand triumph of ze art. Only ze Frenchman can mek ze delicious deesh—zat is ze—vat you call ze owel—ze pet owel." Owl! exclaimed a chorus of voices, and a dozen wry faces were made. "O monsieur, how could you have the heart to kill the poor thing?" chirped the star boarder. "It ees you zat mek so cruel accusations, madame; I no keel him—he die."

BOSTON'S SKILLFUL DENTIST,

DR. F. A. COOKE, D. D. S.,

voices the opinion of his profession regarding the

"In my judgment it meets just the desired need. After using **The Polisher** my teeth have a smooth, clean feeling that cannot be obtained with the bristle brush."

HYPNOTIC TREATMENT.

SUGGESTION AND HYPNOTISM AS THERAPEUTIC AGENTS.

Under the heading of "Faith Healing as a Medical Treatment," Dr. C. L. Tuckey, of London, had an exceedingly interesting paper in the *Nineteenth Century* for December. During the course of his annual holiday last August he visited the town of Nancy, attracted there by a professional curiosity blended with scepticism and prejudice. He went coldly to investigate and came away with a developed power of scientific vision. About thirty years since Dr. Liebault, of Nancy, conceived the idea of employing suggestion combined with hypnotism as a therapeutic agent, not merely for the relief of so-called nervous complaints, but for the cure of the majority of diseases which afflict humanity. His system was taken up by Prof. Dr. Bernheim, of Nancy, who publicly demonstrated its success in his hospital clinique. Liebault's system is now practiced by a considerable number of specialists and other medical men all over the continent. "Hearing for the first time of this treatment by suggestions, one may be inclined, if not to set the whole thing down as a delusion, at least to take for granted that the induced state is a form of hysteria attainable only by impressionable women or by men of unusually weak mental and physical organization, to consider it useless as a means of healing or effectual only for those *malades imaginaires* who are always in search of some new medical dissipation, and are prone to fancy cures as unreal as their ailments. Such a conclusion would, however, be entirely false. All physicians practicing this system are agreed that men, soldiers, out-door laborers, artisans of the most practical type, are, if anything, more susceptible than women." Having still doubts, Dr. Tuckey visited Amsterdam, where Drs. Van Renterghem and Van Eeden carry on an extensive practice among the middle and upper classes; here he watched with great interest the practice of these physicians. "One is asked whether treatment by suggestion has power over all form of disease? Over some it has none. It cannot remove developed cancer or tumor. It cannot reconstruct what disease has destroyed nor do the legitimate work of the surgeon's knife, neither can it stay the course of smallpox, diphtheria and other acute maladies. It frequently acts like magic on rheumatism, on paralysis, on hysteria. It has decided power over evil habits and vicious propensities. Dr. Liebault has counted among his patients many slaves of alcoholism. The doctors at Amsterdam told me they had treated many victims of the morphia craving with good results." Dr. Tuckey also describes the plan adopted to induce the hypnotic state, and discusses definitions and theories—but it yet remains a mystery, though Professor Charcot, of Paris, and others, are trying to make it clear—and closes his entertaining and suggestive article by stating that there is no physiological reason why the majority of people should not possess power to hypnotize, but that there are the strongest moral reasons why that power should be exercised only by approved persons and within strictly regulated limits.

KANSAS BEEF.

A SENSIBLE VIEW OF THE LOCAL INSPECTION QUESTION.

The following practical ideas regarding the inexpediency of the projected beef-suppressing bills is especially significant as emanating from a beef-raising centre. It is quoted from the *Wichita (Kansas) Eagle*:

The local butchers of Pennsylvania, or, more properly speaking, Philadelphia, some timesince, in their own interest and in opposition to Western beef, started an agitation in favor of local inspection of all live cattle intended for food. The cry was taken up by butchers in a number of States, until in many instances local authorities passed ordinances to meet the demands of the butchers in that particular. Of this last we have no complaint to

make. If any community concludes that it is more to its interest to support the local butcher than to have cheap meat for their people, and its people are satisfied with such an order of things, it probably does not become any one else to complain. Such communities are simply paying their good money to sustain what they happen to consider an important local interest. But this question is liable to take a wider scope of far-reaching consequences. It is known that the Pennsylvania agitation and the false showings made in pursuance of sustaining that agitation, resulted in the raising of a committee of inquiry by the United States Senate. Now we learn that a bill is to be introduced in the Kansas Legislature for the purpose of controlling the matter as a State matter and by the State. If great care is not exercised, the cattle interests of Kansas will get such a back-set as will fairly make our farmers and stock-raisers groan. The first result will be that Eastern legislatures will at once say that if Kansas as a State is afraid of her own meats, then the quicker we pass a similar law the sooner will the health of our people be protected. With such laws on the statute books of a majority of the Eastern States, what would become of the markets for Kansas and other Western cattle? There would be no market, except as the beeves of the West were sent around here and there in pairs and dozens to the scattered local markets, which process would ruin the price of live stock throughout the West to the producer in freight charges. This is not said as against the demand for wholesome meats. Every member of the Kansas Legislature is intelligent enough to understand the animus of this inspection move. It comes of the agitation of local butchers. So long as it is left to individual communities of the several States and is not made a State matter, there is not likely to be any counter move made by other States, which counter move would directly and immediately affect the price of our cattle. The cry of diseased cattle is for the most part purely pretence. If there is any ground for such cry, then let the State have a law whereby a State inspector may be appointed for each packing centre. But great care will have to be exercised, or any law passed on the subject will prove a burden to the Kansas farmer and the Kansas stockman, and live stock is the greatest source of income to Kansas to-day. If Topeka or Atchison don't want the cheaper dressed meats of the Kansas City, Kan., packing houses, let them say so through an ordinance providing for local inspection. That's all proper if they so choose. Nobody will force their meats upon them. But don't permit any legislation which will affect the great packing interests that the State has at Kansas City, Kan., and others which will become as great in the State, and all of which insure not only a better price to the farmer for his stock, but redound to the wealth and commercial importance of the State.

FOOD ADULTERATIONS.

REPORT OF THE COMMISSIONER OF INTERNAL REVENUE.

The adulteration of alimentary substances has been practiced from the most ancient times, and numerous laws and regulations have been adopted in various countries to check and prohibit such sophistications. France has taken the lead in protecting consumers of food from adulterations, and in 1802 the Conseil de Salubrite was established in Paris. In England, as well as in France, Germany, and other Continental countries, laws against the adulteration of individual articles, such as tea, coffee, beer and wine, have been passed since the Middle Ages. The first general act was not passed in England till 1860, and this was amended in 1872. However, they were found unsatisfactory, and the Sale of Food and Drugs Act was passed in 1875, and further amended in 1879 in the endeavor to obtain a workable law. The latter law is now in force, though the third and fourth sections of the act relating to the mixing, coloring, staining, or powdering of any article of food so as to injure health, or in the case of drugs so as to injure their

quality, are practically of no value and unenforced, because the fifth section provides that guilty knowledge is essential to the proof of the offence, and no prosecution, unless supported by very exceptional circumstances, would be successful under these sections. Sections six to nine are the ones that are found workable, and provide that no person shall sell food or drugs, with certain exceptions, to the prejudice of the purchaser; shall not abstract any constituents of food, and that compound foods or drugs must be in accordance with the demands of purchase, though with these sections again a large loophole for the escape of offenders is provided in section eight, which states that a legible descriptive notice that the article sold is a mixture exonerates the seller. In this country, in 1877, several of the State Boards of Health united, viz.: Those of New York, New Jersey, Massachusetts and Michigan, and at their instance laws formulated on the English laws were passed, and annual reports are now made by these boards on the results of the examinations of their chemists on the adulterations of food and drugs practiced in their several States. On June 26, 1848, an act was passed by Congress to secure the purity of imported drugs, and is still in force. Its efficacy is directed principally toward Peruvian bark and opium. The tea adulteration law was passed by Congress March 2, 1883, and on August 2, 1886, the oleomargarine law was passed, defining butter and butter substitutes.

The following list of the most common adulterants met with in the principal food products is compiled from the reports of the State Boards of Health, the returns of the English Inland Revenue Department, and of the Report of the Municipal Laboratory of Paris:

FOOD PRODUCTS AND THEIR CHIEF ADULTERANTS.

Food Products.	Adulterants.
Milk.....	Water, removed of cream, addition of cottonseed or oleo oil to skim milk.
Butter.....	Water, salt, foreign fats, artificial coloring matter.
Cheese.....	Lard, oleo oil, cottonseed oil.
Flour, bread.....	Other meals, alum.
Baker's chemicals.....	Starch, alum.
Canned foods.....	Metallic poisons.
Tea.....	Exhausted tea leaves, foreign leaves, tannin, indigo, Prus. blue, turmeric, gypsum, soapstone, sand.
Coffee.....	Chicory, peas, beans, rye, corn, wheat, coloring matter.
Cocoa and chocolate.	Sugar, starch and flour.
Beer.....	Artificial glucose, malt and hop substitutes, sodium bicarbonate, salt, antiseptic.
Syrup.....	Glucose.
Honey.....	Glucose syrup, cane sugar.
Confectionery.....	Glucose, starch, artificial essences, poisonous pigments, terra alba, gypsum.
Olive oil.....	Cottonseed and other vegetable oils.
Vinegar.....	Water, sulphuric acid.
Pickles.....	Salts of copper.
Spices.....	Flour, starches of various kinds, turmeric.

An inspection of this list shows that the great majority of substances used for adulterants are not injurious to health; the public is cheated, but not poisoned. They consist for the most part in the willful and fraudulent addition of substances which do not exist in the normal product, or are only found there in an appreciably lower proportion. Another large class consists of simple alterations by the willful and fraudulent subtraction of some substance that is normally present in the product, and which is not found in the abnormal product, or only in an appreciably lower proportion. The number of substances used that are positively injurious to health is small, and they generally make their presence felt by the prompt manner in which dangerous symptoms manifest themselves in the consumer. Such are the arsenic, copper, lead, and other metallic poisonous salts that are sometimes used for artificial colors in candies, pickles, etc. The use of antiseptics, such as salicylic acid, sulphite of soda, borax, etc., for the prevention of

fermentation in improperly prepared foods, is daily becoming more frequent. These deserve mention as being additions to foods of a class of substances used to cloak carelessness in manufacture, and producing, in many cases, deleterious effects on the human economy. The addition of such antiseptics as salicylic acid to food products is prohibited in France and Germany, though in the latter country such use is allowed when the food product is exported to countries where such addition is not prohibited. Food adulteration is carried on by manufacturers in the interest of pecuniary profit and gain, and they take pains to keep themselves well posted on the subject of cheap and harmless substitutes. This is well illustrated in the most recent form of milk adulteration. The whole milk is placed in centrifugal machines and nearly all the cream fat removed. The machines are then stopped, another drum called the emulsifier put in, or sometimes the same machine is used, the machine restarted; and a charge of cottonseed oil or melted "oleo oil" is then, together with the warmed skim milk, run in sufficiently to bring up the fat contents and specific gravity to those of ordinary milk. A description of such machine will be found in "Engineering," vol. 44, 1887, p. 478. The manufacturers of these machines also describe such emulsifiers in their catalogues. It would be an impossible, not to say a ridiculous, attempt to convince any court or jury that ordinary potable water was either externally or internally "injurious to health," yet it is the most common adulterant used. The watering of milk is everywhere recognized as not only a fraud, but also a very grave misdemeanor, if not actually a crime. This is the food on which the whole population under one year old is fed; and where the mother cannot supply the proper nourishment for the child she must depend for its bringing up on cow's or other milk. It is self-evident that a pint of watered milk does not contain the same amount of nourishment as the same volume of whole milk, so that a child or invalid might be actually starved to death if compelled to rely on the former for its sole nourishment. Many drugs are used both in the arts and in medicine, different degrees of purity being demanded for these different uses. We have such substances as the mineral acids and alkalies, salts of arsenic, antimony, copper, lead, mercury, etc.; alkaloids as aconitine, cocaine, morphine, strychnine, etc.; some organic acids and salts, that are found on the market chemically pure, but which are universally conceded to be very "injurious to health," without any adulterations whatever. Whilst most medicines are drugs, some are not drugs, and again many drugs are not medicines. So that the definition of a medicine should be clearly stated in any law on the subject. The law should be so worded and the penalties imposed for violations so severe that it will deter persons from engaging in the practice of adulteration of food products; in other words, the risks incurred will not pay for any profits that might result from non-compliance with the law. Possession or ownership of an adulterated article of food should be sufficient ground for conviction in a civil action without knowledge in the possession of the dealer that the same was adulterated, being demanded from the prosecution. Many food products spoil in transportation, and penalties ranging from a nominal fine to imprisonment for a term of years should be provided, if, on account of dealing in and consumption of articles so spoiled, or in those injurious to health, a death or even a severe sickness is caused by the same. The inspection of meat, fish, vegetables, fruit, and especially milk, should be done daily in any large city, and properly belong to the health department of such city. Provision should be made for the character of the packing and quality of the vessel, either metal or glass, in which food products are put up. Acid foods will attack and dissolve the solder with which tin packages are closed, and such foods should be put up in glass or acid-proof vessels. The drawing of liquids like beer, vinegar, etc., intended for food, through lead or copper pipes should be prohibited, and iron or block-tin pipes only allowed. Where samples of food products are re-

ceived from the public at large they should be accompanied with an affidavit stating the facts in the case and a small fee for the analysis of the same should be paid in advance. The law should provide for the procuring, by purchase or otherwise, of a sufficient sample and of properly identifying the same. Also for the proper chemical or physical examination by competent analysis, including the salaries of the force employed, the fitting up and maintaining a properly equipped laboratory, including chemicals, apparatus and the purchase of samples by duly authorized agents. All adulterated goods, when sold as such, should be so branded with the word "Adulterated" or the words "This is a mixture," in letters printed in broad-faced type at least one inch long and affixed in a secure and conspicuous place either by a label to the vessel containing the goods or on the goods themselves, and likewise such goods should be wrapped in paper or other covering with said words printed on both sides of the wrapper.

CHARITY AND RED TAPE.

FIVE CASHIERS REQUIRED TO PAY A BREAD BILL.

The Paris correspondent of the *Confectioners' Journal*, writing February 7, gives the following description of the manner in which sleepy old-time customs are perpetuated in even that lively city:

"During the winter months in Paris various charitable societies issue bread tickets, called *bons de pain*, which are on sale at the tobacconists, and cost ten cents each. Charitable people, who don't care about giving money to the poor, buy these tickets and distribute them to the indigent, and every baker in Paris exchanges a 1d. worth of bread for one of these tickets. Business having called me the other day to the *Caisse de la Boulangerie*, or Central Baker's Cash Office, I was present at the refunding to the bakers of cash in exchange for the tickets they had received from the poor during the past month. This cash office is situated on the Quai d'Anjou, near the far-famed Hotel Lambert. The cashiers consist of five master bakers, who volunteer for the service, and these five were seated at a long table. In front of four of these gentlemen were piles of oblong-shaped pieces of black cardboard, which had very much the appearance of slates without frames. In front of each pile of slates was a pile of money—one of copper, one of silver, one of gold, and one of bank notes. The fifth cashier, who sat nearest the door, had neither slates nor money. It was his duty to examine and initial the written bill presented by each baker as he came in. This account he then passed on to his colleague at his side, who had the copper in front of him. This gentleman examined the bill, and then took from his heap of copper the amount of pence in the balance of the account, placed them on one side of his slates and passed this to his colleague with the silver, who added the amount of loose francs marked on the bill, and then passed it on, on the slate, to the gold cashier, who, having added the gold pieces requisite, handed it to the bank-note cashier, who added bank notes to make up the amount of the bill, and paid over the amount due in notes, gold, silver and copper to the baker, who had followed his bill behind the chairs. As a sample of Old World tomfoolery this account of how bills are paid in Paris will certainly interest Americans. Does it not seem incredible that in a business age, when time is literally money, such a custom, surviving from the darkest middle ages, should be tolerated? It took just five minutes for each bill to pass through the hands of the copper, silver, gold and bank-note cashiers before the baker got his money. This absurd mode of payment, I am glad to say, exists nowhere else in Paris, and is a survival of the customs which were in force in the mediæval 'ancient and worshipful company' of master bakers in Paris. In those hoary times massive silver trays were used for carrying the 'buddle' from the company's cash box or treasure chest to the baker who had to receive it. On one tray gold was carried, on another silver, and on another cop-

per. Stately nonsense of this sort was all very well in the days before America was discovered; in the nineteenth century it is a downright anomaly. The only sensible thing about this *Caisse de la Boulangerie* is that on the premises is a large oven in which any baker in Paris, at an emergency, or in case of accident to his own private oven, can have his bread baked."

FISH FANCIES.

HOW THE PUBLIC PALATE IS TICKLED WITH IMAGINARY DELICACIES.

After all there is a vast deal in a name. "Sardines in olive oil" sell readily as disguised Eastport herring in cottonseed oil. "Ocean trout" and "Alaska mackerel" are considered far superior to the common menhaden from which they spring. "Pickled whitefish" are much more satisfactory to the imagination than the weakfish which represent them in the market. "Cod steaks" sound promising even when cut from the savage wolffish. "Kennebec salmon" are always in demand whether from Maine or in the guise of redfish and steelhead from Oregon. It is, therefore, with little surprise we hear just at this time of the wonderful dinners provided by a celebrated restaurateur in Washington with "young halibut" from Norfolk as the chief attraction, transformed and idealized from the homely and humble winter flatfish, which has approached our shores, not to thrill epicures, but to deposit its eggs peacefully. We are reminded of a circumstance in a noted coffee house in Melbourne a few years ago which created a great deal of excitement. The proprietor introduced a fish of surpassing sweetness and delicacy of flavor, under the name of "Sweet William." His patrons eagerly devoured "Sweet William" and the fish had a tremendous run. It was tender, juicy, and entirely free from bones. All went swimmingly for a time. Inquiries failed to reveal the name of the new favorite until one luckless day somebody saw a barrelful of young sharks go into the establishment, to be translated into "Sweet William." Then the volume of business suddenly shrunk and the air was black with threats of suits for damages by enraged customers. And so that's what's in a name.

SEASIDE SWINDLES.

HOW GUESTS ARE FLEECEED TO ENRICH THE SERVANTS.

According to a writer in the *Hotel Mail* the managers of the Coney Island hotels are satisfied, after thorough investigation, that a few men in their employ have made thousands of dollars over their salaries out of the waiters under them, forcing these latter to rob the guests in order to get even. There is always a demand for tables on the piazzas, and guests are willing to pay the waiters for seats at them. They, in turn, pay handsomely for having these tables placed in their charge. A representative of one of the hotels makes the following statement of some of the swindling methods in vogue: "A new waiter was taxed \$10 on the start by the second head waiter, the captains over him taxed him \$1 per week, and a forced collection of \$5 was squeezed out of all the waiters for the benefit of the head waiter. If business was particularly good each waiter was notified that on the following day a cash collection would be taken up for the benefit of the head waiter, and the unfortunate who did not subscribe was discharged. In this way the men over the waiters made about \$5,000 each season out of the waiters alone. They, in turn, got even as follows: If two or more guests ordered double portions, only one portion would be served, and if an expensive brand of wine was ordered, an inferior quality would be served. These officials had a scheme to bleed the wine agents. No new brand was added to the bill-of-fare unless the agent paid well for it. There are a number of saloons in this

city at which the waiters assemble, and where the head waiters apply for a crew. The waiters who have been liberal spenders at his saloon are placed on the list after they pay the necessary fees." A waiter excuses his misdeeds by saying: "The demands made on us are outrageous. At a seaside hotel last year the waiters had to pay the head waiter \$5 almost every day there was any business, and for the slightest offence were discharged, only to be taken back again on the payment of a big fee. During the slack business of wet weather we had to pay the head waiter from \$2 to \$5 in order to hold our positions. We got even by beating the hotel and the guests whenever we could. We all had waterproof pockets in our jackets, and for 15 cents the cook would give us a tenderloin steak. Ten cents to the cook would secure an ordinary steak and a quarter would obtain a chicken. These things were thrust into the waterproof pocket and we would then pass the checkers fearlessly. At the race track restaurants, where we paid \$5 for a job, we got even in this way: Each of us carried a satchel, and when in town we would fill it full of wines, cigars, cold chickens, and almost every other thing that would sell. During the rushes we would sell our own food, pocket the money, and the restaurant food would remain untouched."

FASHION'S FOIBLES.

THE MINOR ADDENDA AND ACCESSORIES OF DRESS.

Just now the repetition of the proverb, "Despise not the day of small things," is hardly necessary, as the most diminutive articles, the fashionable addenda and the accessories to the dress of both men and women, are considered by many as of prime importance. One cannot study the dainty designs of watches, scarf-pins, studs, rings, etc., etc., without feeling a wondering admiration for the brains of the jewelers whose inventions these are. Ladies' watches are small, and may be had from the plain gold stem-winder to that encrusted with jewels. Among the latter is one especially gorgeous, the case being entirely covered with diamonds and rubies set clear through the gold. The fob-chain and the ball at the end of it are studded with the same jewels. Chatelaine watches are becoming fashionable again, and are undoubtedly very convenient, both for wearer and pick-pocket. They are elaborately ornamented with jewels. A new departure is a much less expensive but remarkably pretty little watch of silver. It has an open silver face with gold hands. This case is embellished with *repousse* work, or raised ornamentation, done by men especially for this purpose. We have had silver watches for ladies for years, but nothing before as elaborate and comely as these. Then too they are so reasonable in price, that a woman whose purse is not very long can afford to buy one. The pretty fobs still hold their own, and certainly are preferable to any other chain ever invented. They come set with jewels, enameled, in plain gold, or in gold and platinum. Gentlemen's time-pieces are now made perfectly flat and thin. The open-face is preferred by many to the hunting-case. One of the handsomest of these is of plain, polished gold, the crystal over the open face put on in such a manner that is impossible to tell where the metal on the smooth, rounded edge ends and the crystal begins. The dial is of gold with figures of dark red enamel. This time-piece is a repeater, and fortunate is the man who becomes the possessor. If a monogram is to be engraved on a watch, it should consist of small, neat letters instead of the large, elaborate ones in vogue a few years ago. For evening dress, a gentleman should use the black silk fob-guard with a gold buckle or pendant of some kind, or he may wear an almost invisible chain. The latter, though pretty, is not as good form as the silken guard. For business wear, heavier chains are carried. Some of these are double and may be worn thus on one side, or be separated, the watch on one side, a gold pencil on the other,

and put in opposite vest pockets. Gentlemen's gold lockets are, like their watches, very thin, and are offered in a variety of designs. One, rather sentimental, but pretty, is a gold heart with "*Mizpah*" set in diamonds across it. Stone pendants, engraved with the family crest (if one owns such a thing) or the monogram, are handsome. For these blood-stone is in great request. Compasses or thermometers as pendants can be had in elaborate settings. One, intended especially for a yachtsman, is surrounded by a coil of gold rope held in place at the top by a tiny gold spy-glass. Necklaces are light and tasteful. One is of tiny pearls with a pearl pendant in the shape of a pansy. Another is a delicate chain of gold, holding small flowers with petals of jewelry as nearly as possible like the coloring of natural flowers. Heavy bracelets are not *a la mode*, and in their place we have the thin hoops of gold studded on the upper edge with sapphires and diamonds, diamonds alone, and all varieties of stones. Nothing is prettier than the bracelets of square links, some plain, some *repousse*, and some with jewels set irregularly in the links. Tiny ear-rings have entirely substituted the large jewels of bygone days. The correct thing is a very small diamond screw set close to the ear. Little pearls, one for each ear, are very dainty. Whatever stone is used in the ear-ring should be small. Gentlemen's studs for evening wear are also decidedly diminutive. Three should be worn, and may be made of gold, tiny diamonds, pearls or moonstones, with very little or no setting visible. Scarf-pins are in fashion again, and are of a cluster of stones or some fanciful design. Men should wear sleeve-links, which come in great varieties. Ladies wear sleeve buttons, not links. Perhaps the two most ridiculous fashions are those of the jewelled thimble and garter-clasp. But people must have something on which to spend their money, and these certainly are harmless luxuries. The most elaborate thimbles are of gold *repousse* work, finished at the bottom with a ring of diamonds and rubies. It is hard for us to imagine how these can be used in sewing without abrading the next finger to that on which the thimble is worn. The garter-clasps are plain gold or encrusted with jewels. The long cut-glass vinaigrettes are "out." Instead of the silver girdle of last year, the belle wears a chain fastened at the side by a long silver pin, and to this chain are attached the smelting-bottle *bonbonniere*, memorandum-book, pencil, and as many other silver-mounted articles as a woman wishes to carry. For gentlemen's rings nothing is handsomer than the engraved seal ring. One has a variety of stones from which to choose for this purpose. It is impossible to attempt to describe ladies' rings for they are beautiful and varied beyond precedent, with diamonds solitaire and in clusters, diamonds with rubies, emeralds, sapphires, opals, moonstones, pearls, etc. Moonstones and opals are fashionable, though some people have never overcome the foolish superstition with regard to the mystic opal, which has become poetically described as "a pearl with a soul in it." The very heavy wedding-rings are bought chiefly by the Hibernian bridegroom, who wants to make as much display as possible for the money, and who possibly wishes to prefigure, in the immense ring which wears the finger on which it is placed, the irksome weight the Milesian conjugal yoke generally proves to be. People who are better informed as to the mutations of fashion regard quality rather than dimension in the choice of this important symbol. Gentlemen's match-boxes and ladies' card-cases are very much alike in design, though they differ in size. They may be purchased in gold, silver, and in gold and platinum. Thanks for information in this department are due to TIFFANY & Co., through the *Home-Maker* for February.

A BIG BAR.—The second largest bar of bullion ever melted in the United States assay office at Helena, Montana, was handled September 27, by Melter Mayendorf. It came from the Jay Gould mine, weighing 2,500 ounces was a little over 600 fine in gold, and was worth about \$27,000.

A LINGUISTIC COMPLICATION.

WHY AGAMEMNON FORGOT HIS NATIVE LANGUAGE.

When Agamemnon Jones called one evening upon Miss Clytemnestra Smith, he was startled to a pallid-hueness by hearing her exclaim:

"By jeemenetty crickets! yer was skeered. Ef yer's got anything to say, spit it out. My certis! here's a pretty chamjamfrey! He gied me a caird, but I maun left it below. The pur, shamby, slanchly windelshae o' a creature. An' he ass me iss I want to wuck fo'—"

Agamemnon (wildly): "Great heavens, Clytemnestra! What is the matter with you? Your iced tea was tampered with! Your cream soda—oh, my darling, if you *can't* talk United States, make signs!"

Clytemnestra (contemptuously): "Agamemnon, you don't keep up with the spirit of the age. I was merely quoting from the current literature of the day."

Agamemnon (pathetically): "Browning?"

Clytemnestra: "No, you ignorant Agamemnon; that is not Browning. I was just quoting from magazines, those educators of the age. And, if you want to keep pace with me, Agamemnon, you will have to learn to converse in that style, or you will get most 'boda-ciously' left. Study the *Century*, *Harper's*, any of the best magazines, and you will soon catch on."

Agamemnon (very meekly): "I shall obey you."

And he did. And in less than a week he was entirely unable to converse intelligibly in his native language, and is now earning fifty dollars a day writing magazine stories.—*Puck*.

HIS OWN DIAGNOSIS.—*Mother*—"And do you really feel so very bad, Bobby?" *Bobby*—"Yes, ma. I aint quite sick enough to need any medicine, but I'm a little bit too sick to go to school."

BRILLIANT IDEA.—According to the *Progressive Age* a French electrician, M. G. A. Tabourin, has invented a novel and practical method of lighting the streets which will do away with underground mains and permit the rapid extension of electric light throughout Paris without interfering with the gas companies. In this most wondrous proposal each gas lamp is to be furnished at its base with a small rotary gas engine ten inches in diameter, with a small dynamo and these small installations are to supply lamps on the top of the lamp post, thus burning gas at the bottom and producing electric light at the top of each post. The inventor offers to run at his own cost for several days opposite the Theatre Francais one of these electric lights on his new system.

UTILIZING HUSKS.—One of the best utilized waste products in Australia, resulting in the manufacture of large quantities of paper and cloth, are corn husks. These are boiled with an alkali in tubular boilers, as a result of which the fibres of the husks are found at the bottom of the boiler in a spongy condition, filled with glutinous substance, and which proves to be a perfect dough of corneal, containing in a concentrated form all the pabulum originally contained in the husk. The glutinous matter is pressed out from the fibres by hydraulic apparatus, leaving the fibre in the shape of a mass or chain of longitudinal threads, interspersed with a dense mass of short fibres. The linen made from the long fibres furnishes a very good substitute for the coarser kinds of flax and hemp and is superior to jute, gunny cloth, coir and the like. The paper for which mostly the short fibres are used—the long fibres constituting the material for spinning—is stronger than papers of the same weight made from linen or cotton rags, its hardness and firmness of grain exceeding that of the best dipped English drawing papers, being especially adapted for pencil drawing, stenographic writing and water colors; its durability exceeds, it is claimed, that of paper made from any other material, and the corn-husk parchment is not at exposed points destroyed by insects. If the gluten is left in the pulp the paper can be made extremely transparent without sacrificing any portion of its strength. Again, the fibre is easily worked, either alone or in combination with rags, into the finest writing or printing papers; it also readily takes any tint or color, and can be worked almost to as much advantage into stout wrapping papers of superior quality as into fine note and envelope papers.

THE MINUET.

HOW THE DANCERS' FEET ARE TRAINED TO ITS MEASURES.

"The first thing," says a teacher of the newly-fashionable minuet, "that a lady has to learn is to hold the skirts of her dress. In the beginning of the minuet she must take her overskirt with both hands, just clutching the edge of the garment with the tips of the fingers, and raise it from the floor about as high as the tips of her boots. Then standing squarely upon both feet she is in the first attitude of the minuet. Following that comes the bow, which is a most difficult accomplishment. I think it quite likely that one of the reasons why the minuet went out of favor was the very considerable degree of skill which is required to dance it properly. It is even easier to learn to become a first-rate waltzer than an indifferent minuetist, if I can use the word. The bow is made by drawing the right foot back and placing the toe upon the floor and bending the whole weight of the body back upon it and keeping the left foot square down upon the floor. The lady should sink herself as far as possible without losing the balance. As she goes down, the heel of the left foot may come slowly off from the floor, but the heel of the right foot must not touch it. It is an exceedingly trying movement until one has mastered it, and it takes not only muscle, but some nerve, to keep the equilibrium. In this movement the lady must not take her hands from her skirts, her eyes must be directed slightly upward, and her head should not bow forward. It should rather turn a little bit in the direction of the eyes. The movement must be made very slowly, and the recovery executed with equal deliberation. The gentleman's bow during this interesting process is of a similar nature. It consists in laying his hand upon his heart and bending forward very low. Partners should recover at the same moment. There is another old dance somewhat similar to the minuet in its measured etiquette, and that is the pavane. In that the bow is very similar to the one in the minuet, the difference being that she inclines her head forward and looks down upon the ground. It sometimes is a harder thing to prevent ladies from looking upon the ground than to teach them to keep their balance upon their toes. I remember when I was studying the ballet in Paris that the teacher was always crying out: "Come, ladies, are you looking for pins upon the floor?" The novice, you see, is always in terror about her feet, and apparently wants to look down to see if they are all right. As a matter of fact, the balance can be much better preserved by looking upward, and it is a much more graceful way of doing it."

SANITARY SCIENCE.

IMPORTANCE OF ITS PROPER APPRECIATION TO THE PUBLIC WELFARE.

Much attention of late has been given to country residences, both by sanitarians and the trades allied in interest in house construction. Very extensive observations have been made by Dr. Lucy M. Hall, who recently delivered a lecture before the Academy of Anthropology in New York on "Sanitation in the Country." She has examined over one hundred and fifty country houses in the East and in the West, and gives it as her opinion that the country house is not the healthful place it is usually supposed to be. She has robbed country life of much of the charm with which people in crowded cities have robbed it. A vacation in the country, according to her opinion, is not assured of the promises of health with which many bent on a summer outing regard it. She has found disease and death lurking in the vine-clad cottage and in the cool retreats of the shaded dwelling. This state of affairs is produced by the ignorance of hygienic laws and their violation. Among the evils found to exist are improper drainage, uncemented cellars, failure to ventilate sleeping apartments, exclusion of light, too much shade about the

house, and the improper disposal of kitchen refuse. It is probably not saying too much to state that a majority of country houses owe their escape from more continuous and fatal sickness to the free circulation of the air, the cleansing effects of rains, frost and other natural agents, more than to any regard for sanitary laws. Were the average of country homes crowded together, and shut out from the free action of these agents, as in a crowded city, their sanitary condition would become deplorable. Nature abhors disease, and in many ways attempts to remedy the evils caused by man in the violation of her laws. But the transgressor can go too far. He can trespass too rudely upon her broad benefactions; can weaken the hand that extends to him benedictions, and must suffer. Her laws violated and her strength impaired, artificial means must be resorted to in order to supply the loss. Herein we see the strides made by sanitation; herein we see the lack of it in the country home nestling upon the broad bosom of earth, where nature, uncontaminated, would be sweet and pure. Man not only pollutes nature and weakens her forces, but, through his indifference and ignorance, makes a habitation possible only for disease, and bequeaths to posterity a legacy of constitutional ills. The report of Dr. Hall does not stop with pointing out these evils that a remedy may follow, but, if only half true, it emphasizes in a very direct manner the value of sanitary science as related to the home. Had the science not stepped to the rescue, our crowded cities would have been suffering from the ills that afflict the country house, aggravated by almost limitless accumulations. We are apt to look upon the architect, engineer, builder and plumber as so many people engaged in solving for themselves the problem of bread and butter, and not as so many agents assisting nature in the preservation of life and health. We invite the physician to heal our ills, and shut the door to that science which prevents disease. We rightly esteem the health officer whose diligence procures us pure water, but too lightly regard the responsibility resting on the plumber who safely conducts that water polluted by use from our dwellings. Sanitary science has not only made great advancement, but it has to a marked degree educated mankind up to a recognition and appreciation of its virtues. Its claims are so well established and accepted that a disregard of its teachings and laws can be considered but little less than a wilful act of criminality.—*Sanitary News*.

SEVEN.

AN ATTEMPT TO INVEST THE NUMBER WITH A MYSTIC SANCTITY.

A writer in the *Agricultural Implement* has been studying over the mystical number seven, and concludes that it is undoubtedly the sacred number. There are seven days of creation; after seven days' respite, the flood came; the years of famine and plenty were in cycles of seven; every seventh day was a Sabbath; every seventh year is the Sabbath of rest; after each seven times seven years came the jubilee; the feasts of unleavened bread and the tabernacles were observed seven days; the golden candlestick had seven branches; seven priests with seven trumpets surrounded Jericho seven times and seven times the seventh day; Jacob obtained his wives by servitudes of seven years; Samson kept his nuptials seven days, and on the seventh day he put a riddle to his wife, and he was bound with seven green withes, and seven locks of his hair were shaved off; Nebuchadnezzar was seven years a beast; Shadrach and his two companions were cast into a furnace heated seven times more than it was wont. In the New Testament nearly everything occurs by sevens, and at the end of the sacred volume we read of seven churches, seven candlesticks, seven spirits, seven trumpets, seven seals, seven stars, seven thunders, seven vials, seven plagues, seven angels, and a seven-headed monster.

TURKISH STYLE.

HOW THE SULTAN IS FED AND CARED FOR.

Among the inferior domestic servants of the Sultan of Turkey there are "ten table masters," who cater for the palace kitchens and see that the Imperial tables are duly supplied with food and properly served. Next come ten maitres d'hotel, who superintend the ordering of the menus and the cooking of the meats. The cooks and turnspits, who receive their commands, number 300, while the services of 200 waiters are required in the different dining rooms of the Yildiz Kiosk. Besides the inmates of the palace many persons living in its immediate neighborhood draw by prescriptive right their daily supplies of food from the Imperial kitchens. It is estimated that 800 families, including 4,000 individuals, live in this way at the Sultan's expense. Abdul Hamid employs in his palaces 100 porters, of whom twenty-five are attached to the Yildiz Kiosk and twenty-five watchmen are afoot during the night. Ten servants are charged with the sole duty of carrying and unfolding the Sultan's carpet when he goes to prayer. Ten others, called tutundjis, have the care of His Majesty's pipes and tobacco. Ten cafedjis give all their time to the roasting, grinding and making of His Majesty's coffee. The due order of the Imperial wardrobe is assured by the constant attention of twenty properly qualified employes. Thirteen others keep an eye on the Imperial valise. Five armorers are responsible for the perfect condition of the Sultan's arms. Eight men look after the chandeliers, torches and flambeaux, and eight take care of the aviaries and aquariums. The master of the Imperial stables has under his orders 220 coachmen and grooms, and 100 boatmen receive their instructions from the master rower. The expenses of such an establishment as that of the Yildiz Kiosk are necessarily enormous. The Sultan's civil list figures in the Turkish budget for a million sterling, but it is said the actual expenses of his majesty's household, harem and palaces reach a total of at least £2,200,000 annually.

A NEW USE FOR ELECTRIC LIGHT.—The Superintendent of the Madras Museum has been requested by the Board of Revenue to visit various electrical establishments in Europe in order to select an electric globe light to shine in twenty fathoms of water. Such a light is wanted at the pearl fisheries, for, up to the present, the work of the fisheries has been confined to comparatively shallow banks.

PREHISTORIC RELICS.—The *Oder Zeitung* reports the finding in the Lossow district, near Frankfort-on-the-Oder, of about thirty clay vessels of various sizes and patterns, some urns, some pots, deep saucers, flasks, etc. They were filled with the ashes of burnt corpses mixed with sand. The color was a brownish-yellow; some were broken, and the fractures showed that coal ashes had been mixed with the clay of which they were made. Some bronze needles were found with them, being finished at the top in a semi-circular shape. The vessels seemed to have been formed on a lathe, tolerably smooth, regular in shape, and only slightly baked. The largest were about thirty centimetres in diameter at the widest part and twenty-six centimetres high. The ornaments were either triangles or semi-circles, scratched on the surface with points impressed on the surface. Possibly the site where they were found was a refuge and a place of sacrifice in old German times.

CONTAGIOUSNESS OF CONSUMPTION.—Mr. MacMullen, in the *Australasian Medical Gazette*, calls attention to the danger to which healthy travelers are subjected by consumptives. To illustrate this danger, he narrates a case in which a healthy man, on the voyage from London to Australia, was placed in the same stateroom with a consumptive in search of health. Now that consumption is regarded as a communicable disease, there is no longer excuse for this commingling of well and sick in such confined quarters as a ship's stateroom. Steps should be taken by the owners of steamships and other vessels to separate those who are so unfortunate as to have consumption from those that are healthy, to the degree, at least, that the unsuspecting traveler would not be required to breathe the air impoverished and possibly infected by an invalid suffering from pulmonary consumption.

DOMESTIC DIETETICS.

SPECIALLY PREPARED, FROM PRACTICAL TESTS, FOR THE
LADY READERS OF THE "AMERICAN ANALYST."

SEASONABLE FOOD.

March.

MEATS.—Beef, mutton, ham, kidneys, liver, venison, sausage, veal.

GAME AND POULTRY.—Grouse, hare, pigeon, chicken, duck, turkey, goose, snipe.

FISH.—Bass, cod, snipe, eels, carp, catfish, flounder, halibut, herring, lobster, mackerel, mussels, oysters, perch, pike, rock-fish, salmon, smelt, whitefish, trout.

VEGETABLES.—Artichokes, beans, carrots, celery, garlic, lettuce, onions, parsley, parsnips, potatoes, shallots, spinach, turnips, water cress.

FRUIT.—Apples, bananas, oranges.

PRACTICAL RECIPES.

BEAN SOUP.—Parboil a pint of beans; change the water and boil them till perfectly tender; season with pepper and salt and add a large tablespoonful of butter. Skim out half the beans; to the liquid and remaining half of the beans add a teacupful of sweet cream or rich milk; let it boil up well, and serve.

POT ROAST.—Put a thick piece of beef, with a little bone and fat, an onion, and, if liked, a sliced carrot, over the fire in a pot; just cover with boiling water. Put on a tight lid, and boil gently for four hours, replenishing the water as it boils away with just enough to keep the meat from burning, so that there will be hardly any water left; when it is tender, turn occasionally, and let it brown in its fat when done. Take the meat out of the pot and make a gravy with the drippings; pour over the meat and serve.

DEVILLED OYSTERS.—Dry the oysters and lay in a flat dish; make a mixture of melted butter, lemon juice and Cayenne pepper; pour it over the oysters, and let them lie in it for ten minutes, turning often; take them out, roll first in cracker crumbs, then in beaten egg, again in the crumbs, and fry in half lard and half butter.

STEWED CORN AND TOMATOES.—To two pints of corn add two tablespoonfuls of butter, pepper and salt and just enough water to cover. Put in a saucepan, cover, and cook slowly till tender, stirring often and adding a little water if necessary. Have ready about two cupfuls of stewed tomatoes, and add to the corn just before serving. See that the seasoning is right before dishing. Canned corn and tomatoes may be used if desired.

CORN BREAD.—Two cupfuls of fresh meal, one cupful of flour, one teaspoonful of salt, and two heaping teaspoonfuls of Horsford's baking powder thoroughly sifted together; when the oven is hot, add two well-beaten eggs, two teaspoonfuls of softened butter, half a cupful of syrup or sugar; stir all with cold sweet milk or water to a soft dough; place in a pan and bake immediately.

SALAD DRESSING.—Peel and boil a large fine potato; mash well and, when cool, add the yolk of a raw egg, a teaspoonful of mustard and a little salt; stir well together; add two tablespoonfuls of olive oil and vinegar very slowly, stirring constantly so that it may be very smooth. This is nice with chopped celery or cabbage.

ORANGE CUSTARD.—Peel and slice six oranges, put them in a deep glass dish, with alternate layers of sugar, and let stand for two hours. With one pint of milk and the yolks of three eggs make a soft boiled custard; sweeten and flavor with grated orange peel. When it has cooled a little, pour the custard over the oranges. Serve cold with a meringue made of the whites of the eggs.

BUTTER SCOTCH.—One-quarter pound of butter, three pounds of "coffee A" sugar, one-half teaspoonful of cream of tartar, extract of lemon, water enough to dissolve the sugar; boil, without stirring, till it will crack in cold water. Do not put in the lemon till it is done. Pour on to well-buttered pans, making it about a quarter of an inch thick. When cool, score it across with a sharp knife.

THE WEEKLY ANALYST.

WHAT OUR FRIENDS OF THE PRESS SAY ABOUT US.

AN IMPROVEMENT.

The AMERICAN ANALYST now that it comes to us every week, proves a most welcome visitor. We know of no paper we can more honestly recommend to our subscribers who may want more than one journal than we can the above paper. Every week it is full of good reading matter and of such a nature as to make it most interesting.—*Merchants Mail*, March 8.

JAPAN WAX.—Japan wax is obtained from the tree *Rhus succedanea*, which is found in Japan, China, and throughout the East Indies generally. In the Japanese language it is called *haze* or *haze*. The tree commences to bear fruit when five or six years old, and increases its product every year, till at fifty years a single tree will produce 350 pounds of berries, from which 70 pounds of wax can be obtained. The wax is formed in the middle of the berry, between the seed and the skin, like the pulp of a grape. It is extracted by boiling the berries in water and allowing it to cool, when the wax separates out to a solid cake. The specific gravity of this wax is 0.970, and its melting point 131 deg. Fahr. It is largely used either alone or mixed with tallow, by the Chinese in the manufacture of candles. The principal port of export is the city of Osaka, whence in 1876, nearly 2,000,000 pounds of the wax were shipped to London.

HAY FEVER.—Dr. Morell Mackenzie, in his monograph on this complaint and its treatment, says that, among races, the English and American; among classes, the upper and cultivated; and of the sexes, the males, are especially susceptible to hay fever. In the North of Europe it is almost unknown. It is rare in France, Germany, Italy and Spain; whereas in England it is frequent, and in America prevalent. Again, 99 per cent. of its martyrs are of the upper class, while agricultural laborers who are most exposed to the cause of the complaint, are less subject to its attacks. Lastly, the male sex is more liable to it than the female, in the ratio of three to one. He gives its cause—"the entrance into the eyes and air channels of those predisposed to the ailment, of minute particles of vegetable matter from grasses and plants in flower"—and its cure, chiefly cocaine in one form or another, or residence in certain mountain or seashore localities which are free from the disease.

CAUTION AGAINST A GREAT FRAUD.

Many hotels and restaurants, apparently respectable, and charging enough to make a handsome profit upon the eatables furnished at their tables, pretend to furnish to their guests the genuine Lea & Perrins' Worcestershire Sauce. They actually buy a small supply of the genuine article, but when the bottles are empty, refill them with a cheap, badly flavored and often injurious imitation, which will spoil the flavor of any food to which it is applied. This refilling of a bottle bearing the label and trade mark of the genuine sauce with any imitation sauce is using another person's trade mark for the purpose of defrauding the public, and to the pecuniary injury of the original manufacturer. The fact of the bottles having been purchased, and thereby having become the property of the purchaser, does not give the latter any right to use the bottles for any such fraudulent purpose, and the courts have so held. Any restaurant keeper who would be guilty of such mean fraud cannot be trusted as to the genuineness of anything he sells. A man who for the sake of saving a few pennies will impose a fraudulent sauce upon his customers would sell dog meat for lamb, or cat meat for rabbits. But as the only thing such men fear is exposure, this step will next be taken by Messrs. Lea & Perrins. De-

tectives will secure proof, and some fine morning the newspapers will appear with the sensational headline: "So-and-so's fashionable restaurant raided and the proprietor arrested for fraudulently refilling labelled Worcestershire sauce bottles." This would, of course, forever ruin the reputation of such a restaurant. The remedy is no more than deserved, and no more than the public has a right to expect from the manufacturers. Meanwhile let the public demand of restaurant waiters the genuine Lea & Perrins' Worcestershire Sauce. The public taste and demand is so strong for this celebrated sauce that all first-class restaurants feel compelled to supply it, and some of the short-sighted proprietors seek to avoid the trifling expense by the contemptible fraud just described. Let them beware of being caught.

A MILD WINTER'S EFFECT.

Practically, from a Northerner's point of view, our winter of '88-'89 has been no winter at all. Half a dozen days have been cold, but none really severe, and even if we should have a visitation from a stray "blizzard" in the present month of uncertainties, this would go on record as one of our exceptionally mild winter. Experience has thoroughly demonstrated that an almost inevitable consequence of such a season is "a sickly spring." The human system, accustomed to the alternations of the seasons in a temperate climate, needs them for the maintenance of conditions of health. The pure, bracing winds of winter give the vigor that one needs to withstand the enervating zephyrs of spring and early summer. Furthermore, we unconsciously adapt our dietary habits to the expected requirements of the season and are altogether too apt, if not indeed certain, to eat much more rich, highly nutritious, caloric producing and indigestible food in the winter season than is good for us. In some measure that is compelled by the insufficiency of appetizing fresh vegetables and fruits in our ordinary food supply and the tempting abundance of animal food, of the best quality, at this season, both game and domestic. But, whatever excuses we may find for it, the fact remains the same, and the consequences are unavoidable. A protracted and severe winter keeps the balance fairly near to being right, for it gives us a chance to work off the excess of caloric produced by our food, to oxygenate the blood and render less the accumulations of effete matter. No such healthful conditions have marked the winter now just closed, and we enter upon the spring season worse prepared to meet it, physically, than we have been in any one of a great number of years past. If "a green Christmas makes a fat church-yard," what are we to expect as the consequence of a winter that has all been green? In addition to the fruitful source of disease in our own systems another cause of danger that is of vital importance, should not be forgotten. A severely cold winter kills almost all disease germs exposed to it, but the cold of the past season has been no more than sufficient to render them temporarily dormant. At the present moment, beyond question, untold millions of bacteria—seeds of death—slumber in the mud of our city streets, the never cleaned gutters, the crevices of sidewalks, the neglected back-yards and dark cellars, the margins of rural water courses, and the reservoirs of our city water supply systems, waiting only for the first warm breath of spring to awaken them and quicken them into vigorously reproductive and aggressive vitality. Can any reasonable mind doubt the results when these hosts, inimical to life, assail human systems already enfeebled by the extraordinary and baneful influences of a mild winter such as we have had? In view of the existent conditions, it is imperatively necessary for all who have a care for the preservation of their own health, or who are responsible for guardianship of other lives dependent upon their watchful regard, to see to it that the vital organs are cleansed, strengthened and stimulated to resist the encroachments

of disease and that the blood is purified of the effete accumulations it unquestionably contains. The customary resort to "a spring purgative" is by no means sufficient in an emergency such as the present. Reliance upon it is as unwise as would be the action of a householder who should occupy himself with clearing out a drain-pipe while his house was burning. Radical measures to meet the greatest danger are what common sense prescribes and while the purgative is well enough in its way, and is indeed necessary, the procurement of healthful action of the liver, kidneys and stomach bears to it just about the same relative importance that the extinguishment of the fire does to the opening of the clogged drain-pipe. To accomplish the desired result there is no other medicine so promptly, thoroughly and certainly efficacious as Ayer's Sarsaparilla, and neglect of its use—this season above all others—is simply an invitation to disease and death.

BINDERS FOR THE AMERICAN ANALYST.

We have selected the "Handy Binder" for binding the ANALYST, because of the following advantages: It is elegant in appearance, strong, durable and this new method of binding allows the opening of the pages perfectly flat, owing to the fact that none of the side of the paper is used. This method also permits the taking out and replacing of one or more papers from any part of the file without disturbing the other parts. After the file is completed it ceases to be a temporary binder, and with its contents becomes a perfectly and strongly bound book. Owing to the unusual size and strength of the linen binding cord in combination with two metallic binding strips (loops) the strength and durability of the binding is wholly unequaled by any method yet introduced. Price, sent post-paid, 75 cents. To any subscriber renewing his subscription at \$1 sent directly to this office, we will send one for 25 cents, and we will give one free as a premium for every new subscription sent to us with \$1.

BUSINESS NOTES.

HORSFORD'S ACID PHOSPHATES, AS A RESTORER.

Drs. Buck and Matthews, Springfield, Ill., say: "In cases of nervous prostration, it strengthens by quieting nervous agitation."

AN EXPLANATION.

"What a remarkably neat hand you write." Yes, I always use an Esterbrook Pen.

CLEAN HANDS.

The most convenient thing for the wash-stand we have seen lately is a small rubber toilet brush, not much over an inch long, with rubber bristles, manufactured by C. J. Bailey & Co., of Boston, and sold for twenty-five cents in all drug stores. It removes ink, tar, grease, paint, iron stains, and in fact everything foreign to the color of the skin, simply by using with soap and water. It never becomes foul or carries any contagion, and will not injure the most delicate skin, as is done by the use of pumice stone, bristle brushes, etc. Printers, penmen, typewriters, blacksmiths, machinists, shoemakers, painters, farmers, and all whose hands are stained by their labor, can cleanse them easily, without rupturing or weakening the skin.

MORE FRAUD.

The Cereals Manufacturing Company have been compelled by the numerous imitations of their foods to issue the following caution: Beware of oat foods, under a variety of fancy names, with which the market has recently been flooded, in consequence of the great success of the A. B. C. brand, during the past fourteen years. These imitations are made from the raw groat (hulled oat) crushed, and resemble ours in appearance only. It is claimed, for some of them, that they are partially cooked, whereas the only application of heat is in the process of kiln drying to remove the hull. The A. B. C. oats are not only thus treated, for the same purpose,

but are subsequently twice cooked, first from 2½ to 3 hours, by the direct application of moist steam, and then thoroughly dried by roasting for 1½ to 2 hours with superheated air (desiccated), which removes all traces of moisture and renders them most easy to digest. Also all our other American Breakfast Cereals. This process converts the indigestible starch into digestible sugar, thus gaining 50 per cent. in nutriment, 1 lb. becoming equal to 1½ lb. of the raw cereals above described. This result cannot be obtained by any other method than steam cooking, for which we exclusively hold the patent.

THIRTEEN MILE GUNS.—Two monster Russian guns were sent recently to Sebastopol, says the London Times, for the purpose of being placed in the new iron-clad Sinhope, and although some of the details must be inaccurate, the official description is too interesting to be ignored. They are twelve inch pieces, weighing 50 tons, and throwing projectiles of nearly half a ton. The powder charge is 270 pounds, and the initial velocity 3,000 meters, while the distance of the cannons' ranges is said to be 20 versts, or over 13 miles. As a consequence, the fire of the guns can only be directed by the map, the object fired at being out of sight. Two men, however, suffice for each gun, as they are worked by hydraulic machinery.

ELECTRICITY AND DUST.—M. Soret of Geneva, shows the deposition of dust by electricity in the following manner: He places a platinum cup full of water in a dark chamber, and connects it with one pole of an influence machine, while the other pole is fixed at any convenient distance above the surface of the water. The water is then heated with a Bunsen burner, and its surface strongly illumined by an arc light. As the water boils, the vapor is distinctly visible in the luminous beam; but on setting the machine to work it is re-precipitated on the edges of the cup. By placing the upper pole sufficiently near the surface of the water the whole of the steam disappears, being precipitated as rapidly as it forms, although the water still continues to boil.

Subscriptions \$1 per year. Now is the time to subscribe.

BUFFALO LITHIA WATER

In the Uric Acid Diathesis, Bright's Disease, Chronic Inflammation of the Bladder, etc.

JAMES L. CABELL, M. D., A. M., LL. D., Professor of Physiology and Surgery in the Medical Department in the University of Virginia, and President of the National Board of Health.

"The Water of Buffalo Spring No. 2 contains in notable quantities two of the ALKALIES which are accredited as extremely valuable in the treatment of GOUT, LITHIASIS, and Liver Affections. I refer to the CARBONATES of POTASH and LITHIA.

"I have recently read with interest a paper in 'The New York Medical Journal' on the Buffalo Lithia Water in Diseases of the NERVOUS SYSTEM, in which the writer, Dr. Boyland, citing his own observations and those of other eminent physicians, ascribes to this water a special virtue as a direct tonic for the NERVOUS SYSTEM in cases of CEREBRAL exhaustion. I have only had occasion to test its effects in this direction in cases in which the NERVOUS SYMPTOMS may have been due to LITHÆMIC conditions. In these cases the relief following the use of the remedy was very decided."

Dr. WM. A. HAMMOND, of New York, Surgeon-General U. S. Army (retired), Professor of Diseases of the Mind and Nervous System in the University of New York, etc.

"I have for some time made use of the Buffalo Lithia Water in cases of affections of the NERVOUS SYSTEM, complicated with BRIGHT'S DISEASE OF THE KIDNEYS or with a GOUTY DIATHESIS. The results have been eminently satisfactory. Lithia has for many years been a favorite remedy with me in like cases, but the BUFFALO WATER CERTAINLY ACTS BETTER THAN ANY EXTEMPORANEOUS SOLUTION OF THE LITHIA SALTS, and is, moreover, better borne by the Stomach. I also often prescribe it in those cases of CEREBRAL HYPERÆMIA resulting from over-mental work—in which the condition called NERVOUS DYSPEPSIA EXISTS—and generally with marked benefit."

Dr. ROBERT BATTEY, of Georgia, SUGGESTOR OF BATTEY'S OPERATION.

"I would state that I have been using the Buffalo Lithia Water, No. 2, in my practice for three years past, in cases of CHRONIC INFLAMMATION of the BLADDER, whether induced by STONE, by enlarged PROSTATE in the aged or by NEGLECTED GONORRHOEA, AND HAVE SECURED EXCELLENT RESULTS, which encourages me to prescribe it for the future."

HUNTER McGUIRE, M. D., LL. D., late Professor of Surgery, Medical College of Virginia, Richmond.

"BUFFALO LITHIA WATER, Spring No. 2, as an ALKALINE DIURETIC, is invaluable. In URIC ACID GRAVEL, and, indeed, in diseases generally dependent upon a URIC

ACID DIATHESIS, it is a remedy of extraordinary potency. I have prescribed it in cases of RHEUMATIC GOUT, which had resisted the ordinary remedies, with wonderfully good results. I have used it also in my own case, being a great sufferer from this malady, and have derived more benefit from it than from any other remedy."

Dr. WM. B. TOWLES, Professor of Anatomy and Materia Medica in the Medical Department of the University of Virginia.

"BUFFALO LITHIA WATER, No. 2, belongs to the ALKALINE or, perhaps, to the ALKALINE-SALINE Class, for it has proved far more efficacious in many diseased conditions than any of the simple ALKALINE waters.

"I feel no hesitancy whatever in saying that in GOUT, RHEUMATIC GOUT, RHEUMATISM, STONE in the BLADDER, and in all Diseases of URIC ACID DIATHESIS, I know of no remedy at all comparable to it.

"Its effects are marked in causing a disappearance of ALBUMEN from the urine. In a single case of BRIGHT'S DISEASE OF THE KIDNEYS I witnessed decided beneficial results from its use, and from its action in this case I should have great confidence in it as a remedy in certain stages of the disease."

Dr. THOMAS H. BUCKLER, of Paris (formerly of Baltimore), SUGGESTOR OF LITHIA as a Solvent for Uric Acid.

"Nothing I could say would add to the WELL-KNOWN REPUTATION OF THE BUFFALO LITHIA WATER. I HAVE FREQUENTLY USED IT WITH GOOD RESULTS IN URIC ACID DIATHESIS, RHEUMATISM, AND GOUT, and with this object I have ordered it to Europe, from Coleman & Rogers, of Baltimore. Lithia is in no form so valuable as where it exists in the Carbonate (the form in which it is found in the BUFFALO LITHIA WATER), Nature's mode of solution and division in water which has passed through Lepidolite and Spondumine Mineral formation."

Dr. GRAEME M. HAMMOND, of New York, Professor of Diseases of the Mind and Nervous System in the New York Post-Graduate Medical School and Hospital.

"In all cases of BRIGHT'S DISEASE of the KIDNEYS I have found BUFFALO LITHIA WATER of the greatest service in increasing the quantity of urine and in eliminating the ALBUMEN. In certain cases of Melancholia, accompanied by excessive eliminations of URATES and URIC ACID, it is often the only remedy necessary. In GOUT and RHEUMATISM it is highly beneficial, and in many cases of Impotence its restorative qualities have been of undoubted assistance. I have long regarded BUFFALO LITHIA WATER as the most valuable mineral water in use."

Water in cases of one dozen half-gallon bottles, \$5.00 per case at the Springs.

THOMAS F. GOODE, Proprietor, Buffalo Lithia Springs, Virginia.

Do you know that this is the
finest clothes receive when washed with the
ordinary laundry soap? **You ought to.**

Do you know that
clothing is washed with
PYLE'S PEARLINE as
directed on each package, the
rubbing is done away with?
You ought to.

The greatest wear on clothing is the constant rubbing in the wash. The hardest work in washing is the rubbing up and down on a board. You must admit that anything which does away with the rubbing, and is withal harmless, saves the wear and tear on the things washed as well as the poor woman who does the work. We claim that PEARLINE is that thing. The many millions of packages sold annually would seem to substantiate our claim.

Beware Peddlers and some unscrupulous grocers are offering imitations which they claim to be Pearl-line, or "the same as Pearl-line." IT'S FALSE—they are not, and besides are dangerous. PEARLINE is never peddled, but sold by all good grocers. 137 Manufactured only by JAMES PYLE, New York.

A BUSINESS BENEFIT.

ADVANTAGES TO ADVERTISERS OFFERED
BY THE AMERICAN ANALYST.

It has not the limitations of a daily paper. No one reads yesterday's paper. A monthly lives at least a month, while a semi-monthly is fresh twice a month, and its audience is not limited by geographical lines, but the circulation is all over the United States and Canada.

It contains matters of interest to everyone, especially the ladies of the household, and is, therefore, sure of a careful perusal. Our audiences are intelligent and of the better classes, who have money to spend, and any well worded advertisement in our columns, giving real information, will receive a careful perusal.

Our rates are as low as our circulation affords. Large circulation and original matter cost money, and those advertisers who desire to realize these benefits must expect to pay reasonably for them.

Advertisements in our columns are permanent. Most of our subscribers bind their numbers.

Our advertisements are set up in an attractive form, sure to call the attention of the reader.

Anything that our readers want, or for which a demand is to be created, not wholly of a local nature, will pay to advertise with us.

We take only advertisements from legitimate houses of really meritorious goods, and give them all the editorial assistance they deserve; consequently our readers knowing this, have confidence in advertisements contained in our columns.

The fact that we have the best and largest houses in every branch of trade advertising with us, and that they always renew as their seasons arrive, proves beyond a doubt that they have found the AMERICAN ANALYST a good advertising medium. Why should not you?

GOOD ADVERTISING AGENT WANTED,

Address, ANALYST PUBLISHING CO., 19 Park Place, N. Y.

FOR THE THIRD TIME In our history we have been forced to move into larger quarters to keep up with the demand from our New York, Worcester, Springfield, Providence, Lynn, New Haven, and two Boston stores, and our enormous mail trade. We now occupy two-thirds of an acre of space devoted entirely to custom-work, turning out more garments than any house in the United States. You can order by mail by our system as safely as if you could call at one of our stores. To obtain the famous Custom-made Plymouth Rock \$3 Pants, first, send 6 cents, for which we will mail you 20 samples self-measurement blanks, and linen tape measure, provided you MENTION THIS PAPER, or if you cannot wait for samples, tell us about the color preferred, with waist, inside leg, and hip measures, remit \$3, together with 35 cts. to cover cost of expressage or postage, and we will forward the goods prepaid to any address in the U. S., guaranteeing safe delivery and entire satisfaction or money refunded. Remember, also, that we make to your order, Full Suits, \$13.25, Overcoats, \$12.00, and that for any cause we refund money at buyer's request upon return of goods, or make alterations or new garments free of extra charge.

PLYMOUTH ROCK PANTS CO.

MALTINE

MALTINE is far superior in nutritive and diastatic value to any Malt Extract manufactured in the World. There is no constructive that excels Maltine in Phthisis and many wasting Diseases.

MALTINE in its different forms is the only malt preparation we now employ, being so palatable, digestible, and easily assimilated. Of its efficiency in appropriate cases there is no more doubt in our minds than there is of the curative power of Quinine, Cod Liver Oil, the Bromides, and the Iodides. It deserves to stand in the front rank of constructive, and the constructive by their preventive, corrective, and curative power are probably the most widely useful therapeutical agents that we possess.

PROF. L. P. YANDELL.

MALTINE is a valuable food, a food of priceless value at times of emergency. In fact, in very grave gastric cases it is a food which may be often resorted to when at one's wit's end what to do.

J. MILNER FOTHERGILL.

Out of 14 trade samples of Malt Extract examined by Messrs. Dunstan & Dimmock, only THREE possessed the power of acting on starch. These brands were MALTINE, Corbyn, Stacey & Co.'s Extract, and Keppeler's Malt Extract. WILLIAM ROBERTS, M.D., F.R.S.

I have subjected "Maltine" and all other leading "Extracts of Malt" to an exact quantitative comparison of their diastatic activity. The results demonstrate conclusively the far greater diastatic value of Maltine, and enable me to state, without any qualification whatever, that it far exceeds in diastatic power any of the six preparations of Malt which I have examined.

R. H. CRITTENDEN.

Professor of Physiological Chemistry in Yale College.

At the International Health Exhibition held in London, England, the only gold medal and the highest award of merit were given to Maltine by a Jury composed of the best chemists in Europe, and recent analyses made by the most reliable authorities in Europe and America prove conclusively that Maltine—in nutritive and diastatic value—is superior to all other malt preparations now in the market.

NOTE.—Physicians will observe that Maltine, as now prepared, is not so viscid as formerly made, being of a more fluid consistency; and, while retaining the nutritive and diastatic value which has given it precedence over all other Extracts of Malt, it is rendered entirely agreeable to the taste of the most fastidious, and is more easily administered. As now prepared, we positively guarantee that Maltine will not ferment or congeal in any climate or at any season of the year.

COMPLETE LIST OF MALTINE PREPARATIONS.

MALTINE (Plain). **MALTINE** with Phosphates, Iron Quinine, and Strychnia. **MALTINE** with Alternatives. **MALTINE** with Cod Liver Oil. **MALTINE** with Ferrated. **MALTINE** with Hypophosphites. **MALTO-YERBINE**. **MALTINE** with Peptonin. **MALTO-VIBURN**. **MALTINE** with Pepsin and Paeurotine. **MALTINE** with Oscara-Segrada.

Physicians may obtain Maltine from all druggists in every part of the world. In cases where the physician intends to prescribe Maltine, the word "Maltine" should be written, and not simply the words "Malt Extract," or "Extract of Malt."

Send for Pamphlet giving comparative analyses by 100 of the best Analytical Chemists in this country and Europe.

We will be happy to supply any regular practitioner with eight ounces each of any three Maltine compounds that may be selected from our list, providing he will agree to pay express charges on same.

ARDENTER MUSTARD.**

BEST IN THE WORLD.

WARRANTED
ABSOLUTELY PURE.

WARRANTED
ABSOLUTELY PURE.

Ardenter Mustard Pellets

— FOR —

Dyspepsia and Indigestion.

UNIVERSALLY recommended and prescribed by physicians. The medicinal property are English mustard seed coated with pepsin and sugar. You will find it will relieve you after using two or three doses. It is very beneficial for Heartburn, Sour Stomach and Headache. They are a beautiful confection for children. Each bottle contains full directions.

W. G. DEAN & SON,

361 and 363 Washington Street, 84, 86 and 88
North Moore Street, New York.

COLDEN'S
ORIGINAL LABEL:
"Colden's Liebig's Liquid Extract of
Beef and Tonic Invigorator."
LIQUID
BEEF TONIC.

AN INVALUABLE AID IN THE TREATMENT OF
ALL CASES OF DEBILITY.

Established 15 Years. Endorsed by Scores of Physicians.
Essentially Different from all other Beef Tonics.
Beware of Imitations.

COLDEN'S LIQUID BEEF TONIC consists of the Extract of Beef (by Baron Liebig's process), spirit rendered non-injurious to the most delicate stomach by extraction of Fusel Oil, soluble Citrate of Iron, Cinchona, Gentian and simple aromatics. An official analysis of this preparation by the eminent chemist ARTHUR HILL HASSALL, M. D. F. R. S., and an endorsement by SIR ERASMUS WILSON, F. R. S., is printed on the label of each bottle.

Its Range of Action Embraces all Cases of Debility.

By the urgent request of several eminent members of the medical profession, I have added to each wineglassful of this preparation two grains of SOLUBLE CITRATE OF IRON, and which is designated on the label as "No. 1," while the same preparation, without Iron, is designated on the label as "No. 2." It acts directly on the sentient gastric nerves, stimulating the follicles to secretion and gives to weakened individuals that first pre-requisite to an improvement, an appetite.

As I will, upon application, send a sample bottle of Colden's Liquid Beef Tonic to any physician in regular standing. Please ask your Dispensing Druggist (if he has not already a supply) to order it. In prescribing this preparation physicians should be particular to mention "COLDEN'S" viz: "EXT. CARNIS. FL. COMP. (COLDEN)." It is put up in pint bottles and can be had of Wholesale and Retail Druggists generally throughout the United States.

OUR NEXT ANNIVERSARY.

The programme for the celebration of April 30th, in this city, is completed, and the significance of the event seems, in our opinion, to justify a brief description of it in this column. The inauguration of George Washington, one hundred years ago, on the 30th of next month, was the last great act in what John Fiske rightly calls the critical period of American history—the period between the close of the Revolutionary war and the beginning of the first Administration under the constitution. The New York celebration will be compressed into two days—Monday, April 29th, and Tuesday, the 30th. The central figure in the commemorative exercises will be the President of the United States, who will travel from Philadelphia to the foot of Wall Street, in this city, over the exact route that Washington took. He will leave Philadelphia early on the afternoon of Saturday, April 27, and, reaching Trenton, N. J., will pass under the same arch that Washington passed un-

der in 1789, and Lafayette in 1824. The arch was made from funds contributed by the women of Trenton, and has been preserved in Independence Hall in Philadelphia for a hundred years. President Harrison will give a reception at the New Jersey State capitol, and will spend Sunday in that city. On Monday morning he will proceed to Elizabethport, where he will be received by the New York committee, and will embark on a Government dispatch boat. The journey thence to the foot of Wall Street will be through a fleet of war vessels of this and other nations in the harbor and a fleet of steam yachts, all decked out in holiday bravery; and the harbor forts and the gunboats will make the Staten Island hills quake with their salutes of welcome. When the President has landed he will be escorted by troops from the regular army to the Equitable building, the Governor and the Mayor doing the civic honors of the occasion, where a reception will be held. A thousand invitations will be sent to distinguished men in the professions and in all branches of business to meet the President at this reception. In the evening will take place the grand ball at the Metropolitan Opera House. So much for Monday. Tuesday, however, will be the big day. The first thing will be religious exercises in the historic St. Paul's Church, the President, cabinet, Governors of the States, and other distinguished guests attending. At ten o'clock the literary exercises will take place on the steps of the sub-treasury in Wall Street, the very spot where Washington was inaugurated. Rev. Dr. R. S. Storrs will deliver a prayer. Whittier is expected to send a poem to be read; Chauncey Depew will deliver an address; President Harrison is expected to speak briefly, and Archbishop Corrigan will pronounce the benediction. Then, at about 11.30 A. M., the procession will start up Broadway from Wall Street, turning into Fifth Avenue at Washington Square, and proceeding up Fifth Avenue under two triumphal arches at the ends of the great reviewing stand, which will extend from Twenty-third Street to Twenty-sixth Street, along Madison Square. The procession will be numbered by the tens of thousands, and will be hours in passing the stand. The National Guard and other State militia organizations will fill the city with citizen soldiers, for whom halls have already been engaged as camping grounds. Word has been received that Virginia will send the First Regiment of her State troops, and perhaps the entire militia force of the Commonwealth. Minnesota will send a thousand troops. The entire National Guard of this and probably of the adjoining States will be present, together with the regular army troops, marines, and, it is hoped, the West Point and Annapolis cadets. On Wednesday there will be an industrial parade, and during the month of April the exhibition of colonial portraits and Washington relics will be visible at the Metropolitan Museum of Art.

THE HALF-HOLIDAY FOLLY.

The Chamber of Commerce of this city has taken the backtrack on the subject of the Saturday half-holiday. When the measure was introduced a year ago that body

favored it, but last week it adopted resolutions recommending the repeal of the law. Altogether it was a foolish piece of legislation. The experiment has accomplished nothing that was expected of it, and among employers and employees it is now realized that holiday-making by act of the Legislature will not give more pay for less work, nor an increase of leisure without a decrease of wages. There is a growing disposition to shorten the week's labor in summer where business requirements permit, and perhaps a Saturday holiday law confined to the summer months would not have serious ill effects in this city; but the rural districts, whose influence is supposed to be potent at Albany, can scarcely afford to submit to the serious effect which a summer Saturday holiday law would have on their interests.

THE BROOKLYN ICE CREAM POISONING.

In the case of the poisoning of nearly one hundred people by eating ice cream purchased of Enoch Swain, 1187 Fulton Street, there is only one point deserving of emphasis. This special point has already been referred to in another column, namely, the gross ignorance of this ice cream manufacturer in purchasing an article of coloring with the dangerous nature of which he claimed to be entirely unacquainted. This is made still more apparent by his attempt to impress the authorities with the assertion that he thought he was purchasing cochineal coloring. No blame whatever can be attached to the manufacturers of the carlie red, as carlie red is a regular article of commerce prepared by nearly every wholesale drug house in this city, and used for many different purposes. It was plainly labelled and whoever purchased it could reasonably be supposed to know its nature. It is simply a mixture of aniline red in glycerine and alcohol. Aniline red, as every one knows, contains arsenic, but not in such quantities that would, when used in the minute quantity claimed by Mr. Swain, have produced the poisonous effects. Having thus found Swain to have made several misstatements, very little dependence can be placed on his story, and from all the circumstances it seems just as likely that he used some other pigment than the carlie red. It might be as well to pass a law absolutely prohibiting the use of any coloring matter in food products unless such matter is positively known to be free from poison.

A VALUABLE NEW FABRIC.

A firm of French manufacturers have brought out a new textile fabric, the advent of which is deserving of conspicuous mention and is of much popular interest. It is called "ramie linen," and is made, as its name indicates, from the fibre of the ramie plant, otherwise known as the "silk plant" and "China silk." The fact has long been known that this was, in every way, one of the most desirable of vegetable fibres, but there were peculiar difficulties in utilizing it—owing to its length, great strength and glassy smoothness—that have only recently been thoroughly overcome by certain very ingen-

30 Shaves

for 2 Cents.

Send a two cent stamp to Colgate & Co. 55 John St., New York, who will mail you a sample of this superior soap sufficient to last a month,

ious mechanical processes. It possesses all the softness and lustre of silk, but is even smoother and is stronger than either silk or linen. When woven into sheeting it has fully double the strength of linen, and, instead of roughening and weakening in wear through the throwing off of portions of its fibres in the form of lint and floss, grows smoother, more lustrous and seemingly closer in texture. This absence of a tendency to disintegration and the remarkable purity of its fibre constitute for it exceptional value for the use of surgeons who find it better than any other material for bandages and dressings, particularly in antiseptic treatment. It is also found that bed-linen of ramie fibre absorbs no uncleanly emanations from the human body as linen and cotton do, and is much more easily thoroughly cleansed than is either. It would hardly have been too much to say of it that it seems to have a property of repelling dirt of all kinds. Severe tests have demonstrated that the ramie linen is, by comparison with those made from flax or hemp, practically indestructible, or, at least, that its durability is such that an amount of washing that reduces them to shreds and rags leaves it sound, whole, smooth and apparently new. The manufacture of this new fibre now extends to sheeting, towels, table linen, guipure curtains, and it is hoped will soon be extended so as to supply us with a material for shirts that will better resist the vindictively ferocious energy of the laundress than anything we now have.

POISONOUS TINFOIL.

A great deal of the material which is erroneously called tinfoil is used to wrap articles of human food, including Neufchatel cheese, chewing gum, licorice pellets, fig paste, various kinds of candy, chocolate and nearly all kinds of chewing tobacco. As the most of this tinfoil is largely composed of lead, it is very dangerous to health, and its use for wrapping food has been legally forbidden in France. It should be prohibited here. Nothing that is to be taken into the mouth should be allowed to come in contact with lead. An analysis of some of these "tinfoils" might astonish the public and largely curtail the sales of cheap chewing gums, chocolate and licorice pellets.

INDIA INK.

The process of manufacturing India ink has been a secret with the Chinese for many centuries. An investigation made by some English chemists has shown that by the action of sulphuric acid on camphor a pigment identical with India ink is obtained. Camphor is placed in contact with strong sulphuric acid for twenty-four hours resulting in a reddish gelatinous

mass, which when heated gives off sulphurous acid and turns intensely black. The residue of camphor and acid being driven off by heat, the pigment remains. This pigment appears to be soluble in water.

AN ANSWER REQUESTED.

The *Butcher's Record*, of Allegheny, Pa., has on several occasions favored us with more or less—usually less—pertinent queries about dressed beef and lard. We now have a little conundrum for that astute journal. The butchers of Pittsburgh and Allegheny are in the habit of using a preparation called "Saviture." It is recommended as a sure preservative of meat, and to "remove all smell, taint and appearance of decomposition from spoiled meat." It is largely composed of boracic acid and phosphate of soda, and has been long since condemned by health authorities as poisonous. Will the *Butcher's Record* please inform us how much rotten meat the Pittsburgh butchers manage to rid themselves of by using this delectable "Saviture."

OLEOMARGARINE.

WHAT IT IS AND HOW IT IS MADE.

Oleomargarine, strictly speaking, is butter artificially lengthened. If we were to ask a dairy farmer which of his cows' milk he can make the most butter from, he would point to the lean cow. The fat of the lean cow goes into her milk; consequently, the milk of such a cow makes the most butter. Just what nature does here science has done in making oleomargarine. Pure, clean, animal fats, and only such can be used, carefully prepared with a vegetable oil such as cotton-seed, the best butter, creams and milk, with salt and coloring matter, constitute oleomargarine. These various ingredients are purchasable in the open market, being all articles of regular commerce. Oleo oil is made by the large slaughter-houses, and gives them an outlet for the immense quantity of fat they constantly obtain from the cattle slaughtered for beef. The caul and suet fats are removed from the freshly slaughtered beeves and placed in tanks filled with water at 75 deg. to 85 deg. Fahr., where they remain from two to three hours before being transferred to other tanks containing ice water. By this procedure the fats are gradually deprived of their animal heat and the danger of their becoming sour is avoided, as would happen if the mass of fat was suddenly chilled by being placed directly in ice water. The caul, long or slaughter fat, is kept separate from the suet fat, which yields an inferior grade of oil. None but fresh, sweet fats from healthy animals can be used, as any other would give the whole batch a bad taste and unpleasant odor. A steer will yield on an average 65 pounds of caul and suet fats, from which are obtained 28 pounds (43 per cent.) oleo oil, 21 pounds (32 per cent.) oleo stearine, and 12 pounds (20 per cent.) high-grade tallow. The chilled fats having been thoroughly washed to remove any blood that may be present, are then sent to the rendering tanks. These are generally in a separate building from the slaughter house. Fat from cattle slaughtered late in the afternoon is generally kept in the ice-water tanks over night before being rendered; thus no fat is more than twelve or fourteen hours on hand, and the great majority less than four hours, before it is rendered. The fat is fed into choppers or hashers revolving at a high rate of speed, from which it issues through fine sieves directly into the rendering tank. This is a large steam-jacketed upright kettle of 2,000 to 5,000 pounds capacity, provided with revolving blades driven by suitable machinery. Steam being turned on in the jacket, the hashed fat is fed continuously into the tank and kept in motion by the stirrer. When the tank is full and the contents thoroughly melted, the temperature being 120 deg. to 150 deg. Fahr., the stirrer is removed and the water and scrap

allowed to settle. The clear fat is drawn off from the top and run into the graining or seeding cars of 400 to 600 pounds capacity, where it is allowed to chill. The temperature of the room in which these cars are stored is maintained at 85 deg. to 95 deg. Fahr. The fat in chilling naturally solidifies gradually; the hardest variety, the stearine, being the first to form a thin crust on top and sides. In from one to three days the whole contents of the car will be in a semi-solid condition. This fat is free from all "greasy" taste. The car containing the semi-solid fat is taken to the press room, which is maintained at a temperature somewhat below that of the seeding room, viz., 70 deg. to 80 deg. Fahr., where it is dipped out by a ladle and poured on a stout linen cloth, placed in a suitable depression on a wooden revolving table, and after the cloth is properly folded, so as to make a rough bag, it is transferred to the metal plate of a screw press. A dozen of these cloth bags cover the surface of a plate. When one plate is covered another one is let down and filled. When the press is filled, pressure is gradually applied by means of an endless chain revolving a screw; the expressed "oil" constitutes the "oleo oil." The liquid fat is conducted, still hot, from the press into barrels or cars, where it is allowed to cool. The finished product is nearly colorless, tasteless, and at ordinary temperatures is a soft, granular fat, rather than an oil. The hard fat remaining in the filter bag is removed from the press and forms the beef or oleo stearine, which is used either for making "refined lard," by the addition of cotton-seed oil, or sold to the soap and candle makers. The manufacture of "neutral lard" is conducted by essentially the same machinery and at about the same temperature employed in the manufacture of "oleo oil." Only the leaf fat of freshly-slaughtered hogs is used. A hog yields from 5 to 15 pounds of leaf lard, averaging 9 pounds, 100 pounds of which yields 90 pounds "neutral." The "neutral," however, is not pressed to extract the stearine, but is run directly from the rendering tank into a very strong iced brine, where it remains for about twenty-four hours, when it is removed and placed on shelves to drain. The "neutral" is a white, slightly granular, tasteless, solid fat. The skimmings and scrap from the lard-rendering kettles are strained, and the fat, about 2 per cent. of the original charge, obtained from them added to the steam-rendered product. Several factories, however, use the ordinary steam and kettle-rendered lards, and not "neutral." Great cleanliness is observed throughout both processes, and there is very little manual handling, machinery being used as much as possible, and the fat carefully guarded from any source of contamination. The by-products of oleo oil and neutral, viz., stearine, tallow and lard, are standard merchantable articles. Only fresh and sweet fats are used, and tanks, etc., are thoroughly cleaned before use, as a small amount of fat, if allowed to adhere to the apparatus, is liable to decompose in such a way as to spoil the succeeding batch of materials worked up. Though there may be slight differences in the details, the range of temperature, size of tanks, etc., pursued by the different manufacturers, the general procedure is as above described, the object being to obtain a neutral fat, melting at butter temperature. The cotton-seed oil used is prepared in several ways, and refined to make it of a light straw color and bland taste. The butter used is always selected for its high flavor and taste, and is generally obtained direct from the creamery. Owing to the granular character of oleo oil it becomes necessary to add some softer and smoother fat; and neutral lard and cotton-seed, or other similar vegetable oil, are added for the purpose of making the mixture more closely approach the consistence of butter. The proportions in which these ingredients are used vary with the seasons of the year, the grade desired, and the formulas of the manufacturers. The charge of milk or cream, however, is the same for all grades manufactured by any particular factory, and varies from 10 to 20 per cent. The milk or cream is allowed to become slightly sour. The churn used is steam jacketed, of 1,200 to

2,500 pounds capacity, and the whole operation of churning is conducted at a temperature of 85 deg. to 105 deg. Fahr., insuring the melting and thorough mixture of all the solid fats used, thus differing from ordinary creamery practice. The oleo oil and neutral lard are melted in separate kettles at a temperature of about 90 deg. Fahr. The charge of milk or cream is first run in, and the paddles kept in motion until the butter begins to form. Then the charge of melted oleo oil is added and stirred. When this is well incorporated the neutral lard is run in, and finally the annatto, to give the desired butter color. The butter is added either directly into the churn, being first melted, or it is worked into the oleomargarine after it is taken from the churn. The temperature is carefully regulated, being about 85 deg. Fahr. at the beginning and gradually increasing to 105 deg. Fahr. at the end, when the whole charge has the appearance of a yellowish, creamy fluid. From twenty to ninety minutes are occupied in the churning. The whole melted charge, after it has been sufficiently churned to thoroughly incorporate all the ingredients, is run either directly into tanks containing chopped ice and constantly stirred, or is met by a stream of ice water as it issues from the churn. The object is to give the melted mass a fine grain by this sudden cooling. The chilled mass is removed from the tanks and placed on wooden trays to drain. Here the salt is added and allowed to work itself in, which generally takes from twelve to twenty-four hours. The salted mass is then thoroughly worked by mechanical rollers, to remove the buttermilk and water, following the general practice of creameries in this and subsequent operations of packing, etc. Oleomargarine is placed on the market either "solid packed" or in prints or rolls. Four grades are generally made, known as "dairy" and "extra dairy oleomargarine," "creamery" and "extra creamery butterine," the last two containing from 10 to 25 per cent. of the best creamery butter. In the lower grades, from 25 to 60 per cent. of neutral lard, from 20 to 50 per cent. of oleo oil, from 5 to 25 per cent. of vegetable oils, and in some cases from 2 to 10 per cent. of butter, with 10 to 20 per cent. of milk or cream, are the proportions used. Some factories employ no vegetable oils in their oleomargarine, preferring to use a larger proportion of neutral lard with a small amount of butter to obtain the desired butter consistency. In the higher grades the proportions of oleo oil are reduced, the vegetable oils are discarded, and creamery butter is used to make up the charge. A very natural question arises—that is as to the cleanliness, wholesomeness, and relative cost of oleomargarine. As to the first, the best answer that can be made is that in the large oleomargarine factories the employees who are constantly engaged in making it, and who know all about the quality of the materials from which it is made, buy it in preference to butter for use on their own tables. As to its wholesomeness, enough has been said as to its only slight difference from natural butter, and therefore there can be no doubt as to its healthfulness; and even, if any doubt existed, the statement, endorsed by every scientist in the country, that it is just as pure and healthy as good butter, would settle that. And finally as to its relative cost, it helps in two ways. Being cheaper to manufacture, it can be sold at a lower price; and in addition, being a formidable rival, by competition, it keeps down the price of butter. This, then, is the much-abused article, which is only kept out of the consumers' reach by unconstitutional class legislation.

POPULAR FALLACIES.

SOME OF THE MISTAKEN NOTIONS WHICH LEAD TO HARM.

It is a mistake to labor when you are not in a fit condition to do so. To think the more a person eats the healthier and stronger he will become. To go to bed late at night and rise at daybreak, and imagine that every

hour taken from sleep is an hour gained. To imagine that if a little work or exercise is good, violent or prolonged exercise is better. To conclude that the smallest room in the house is large enough to sleep in. To eat as if you had only a minute to finish the meal in, or to eat without an appetite, or continue after it has been satisfied, merely to gratify the taste. To believe that children can do as much work as grown people, and that the more hours they study the more they learn. To imagine that whatever remedy causes one to feel immediately better (as alcoholic stimulants) is good for the system without regard to the after effects. To take off proper clothing out of season because you have become heated. To sleep exposed to a direct draught in any season. To think any nostrum or patent medicine is a specific for all diseases the flesh is heir to.

CORRESPONDENCE.

LARD vs. COTTON-SEED.

NEW YORK, March 14, 1889.

Editors Analyst: Will you please inform me what the Cotton-seed Oil Product Company's cotton-seed lard is—whether it is wholesome and as cheap as they advertise?
MIRANDA.

We publish this inquiry and reply to it because the question is similar to many others received by us. Cotton-seed lard is a misnomer and calculated to mislead. Lard is a French word, meaning bacon, and has been adopted into the English language, to designate tried out hogs' fat. The company which manufactures this cotton-seed "lard" has so mendaciously attacked all hog products that the least they can do, in our opinion, is to leave the poor hog the name of one of its chief derivatives. This cotton-seed lard, as nearly as we can judge without a special analysis, is made of cotton-seed oil and stearine, raised to a high degree of heat and suddenly chilled. As it takes about three pounds of this stuff to answer the same purpose as two and a half pounds of any good genuine lard, and, as it is sold at a higher price, it is certainly not cheaper. So much for that part of our correspondent's inquiry. For many foods it cannot be employed, because the peculiar smell of cotton-seed oil in such undue proportions and the taste of stearine are not considered any recommendation. It commands no sale in the exchanges, but is simply pushed by extensive advertising through retail grocers.

FEEDING THE SEA SICK.

THE EXTENSIVE LIST COMPRISED IN AN OCEAN STEAMER'S STORES.

Some notion of the consumption of food on board our floating hotels may be interesting to some of our readers, and in their interest we have gathered together the following notes: For a single passage to the westward, the *Etruria*, with 547 cabin passengers and a crew of 287 persons, had, when leaving Liverpool on the 27th August last, the following quantities of provisions: 12,550 lbs. fresh beef, 760 lbs. corned beef, 5,320 lbs. mutton, 850 lbs. lamb, 350 lbs. veal, 350 lbs. pork, 2,000 lbs. fresh fish, 600 fowls, 300 chickens, 100 ducks, 50 geese, 80 turkeys, 200 brace grouse, 15 tons potatoes, 30 hampers of vegetables, 220 quarts ice cream, 1,000 quarts milk, and 11,500 eggs. In groceries alone there were over two hundred different articles, including, for the round voyage of twenty-two days, 650 lbs. tea, 1,200 lbs. coffee, 1,600 lbs. white sugar, 2,800 lbs. moist sugar, 750 lbs. pulverized sugar, 1,500 lbs. cheese, 2,000 lbs. butter, 3,500 lbs. ham, and 1,000 lbs. bacon. The foregoing seem enormous quantities, but very little was left upon the ship's arrival in port. The quantities of wines, spirits, beer, etc., put on board for consumption on the round voyage comprise

1,100 bottles of champagne, 850 bottles of claret, 6,000 bottles of ale, 2,500 bottles of porter, 4,500 bottles of mineral waters, 650 bottles of various spirits. Crockery is broken very extensively, being at the rate of 990 plates, 280 cups, 438 saucers, 1,213 tumblers, 200 wine glasses, 27 decanters and 63 water bottles in a single voyage. As regards the consumption on board the Cunard fleet for one year, a steward says: "We consume no less than 4,656 sheep, 1,800 lambs and 2,474 oxen—an array of flocks and herds surpassing in extent the possessions of many a pastoral patriarch of ancient times. This is equivalent to 2,091,754 lbs. of meat. We consume 831,603 eggs, and we drink 21,000 pounds of tea in the year, and 71,770 lbs. of coffee, sweetened by 296,000 pounds of sugar; whilst the following articles also figured largely: 1½ tons mustard, 1¾ tons pepper, 7,216 bottles of pickles, 8,000 tins sardines, 30 tons salt cod and ling, 4,192 four-pound jars jams, 15 tons marmalade, 22 tons raisins, currants and figs, 18 tons split peas, 15 tons pearl barley, 17 tons rice, 34 tons oatmeal, 460 tons flour, 23 tons biscuits, 33 tons salt, 48,902 loaves bread (8 lbs. each), 53 tons ham, 20 tons bacon, 15 tons cheese, 930 tons potatoes, 24,075 fowls, 4,230 ducks, 2,200 turkeys, 2,200 geese, 31,212 tablets Pears' soap, 3,484 lbs. Windsor soap, 10 tons yellow soap. Our passengers annually drink and smoke to the following extent: 8,030 bottles and 17,613 half-bottles of champagne, 13,941 bottles and 7,310 half-bottles of claret, 9,200 bottles of other wines, 439,344 bottles of ale and porter, 174,921 bottles of mineral waters, 34,400 bottles of spirits, 34,360 lbs. tobacco, 63,340 cigars, 56,875 cigarettes. The heaviest item in our annual consumption is naturally coal, of which we burn 356,764 tons, or almost 1,000 tons for every day in the year. This quantity of coal, if built as a wall four feet high and one foot thick, would reach from Land's End to John o'Groat's House."

ICE CREAM AND ARSENIC.

BEWARE OF DANGEROUS COLORING IN ICE CREAM.

Seventy-five persons have recently been made seriously sick by eating ice cream which had been flavored with a compound containing arsenic. The cream was made by E. C. Swain, of No. 1187 Fulton Street, Brooklyn. The case first came to the attention of the Health Department through the sickness of members of a family, who live over Swain's store. The physician called in to attend them suspected the strawberry cream they had eaten, and a sample was forwarded to the Health Department. Chemist Kent found traces of arsenic in it, and investigation showed that it had been colored with carlie red, obtained from a drug firm in New York. When this was analyzed it was found to contain arsenic. It is an aniline coloring matter. Further enquiry shows that many persons have suffered from eating strawberry cream, and a general investigation is in progress regarding the flavoring matters used. Mr. Swain supposed he was getting cochineal when he purchased the coloring matter. He destroyed the ice cream flavored with the poison as soon as he discovered its nature. It is only the old story of food manufacturers using materials, the composition of which they know nothing about. In all the cheaper aniline reds arsenic is employed to oxidize the color. When the arsenic has been thoroughly washed out as it is in the higher priced colors, they are safe to use. But the question still remains, by what right does a confectioner use any color or material without positively knowing that it is safe.

THE MICROBE OF MALARIA.—The evidence is accumulating that the microbe of malaria which was described by Laveran, is the cause of intermittent fever. At a recent meeting of the French Academy of Sciences, Professor Bouchard expressed the opinion that Laveran's claim had been substantiated.

REVIEWS OF NEW BOOKS.

THE PSYCHIC LIFE OF MICRO-ORGANISMS.—A Study in Experimental Psychology. By Alfred Binet. Translated from the French by Thomas McCormack. Chicago, 1889. Open Court Publishing Co.

M. Alfred Binet, the collaborator of Ribot and Féré, and one of the most eminent representatives of the French School of Psychology, has presented in the above work the most important results of recent investigations into the world of micro-organisms. The subject is a branch of comparative psychology little known, as the data of this department of natural science lie scattered for the most part in isolated reports and publications, and no attempt has hitherto been made to collate and present them in a systematized form. The cuts, eighteen in number, are illustrative of the movements, nutrition, digestion, nuclear phenomena, and fecundation of proto-organisms. The most interesting chapters are those on fecundation, which demonstrate the same instincts and vital powers to exist in spermatozooids as are found in animals of higher organization. M. Binet's researches and conclusions show, "that psychological phenomena begin among the very lowest classes of beings. They are met with in every form of life from the simplest cell to the most complicated organism." The author contests the theory of the distinguished English scientist, Prof. George F. Romanes, who assigns the first appearance of the various psychical and mental faculties to different stages or periods in the scale of zoological development. To M. Binet there is an aggregate of properties which exclusively pertain to living matter, the existence of which is seen in the lowest forms of life as well as in the highest.

THE WEEKLY ANALYST.

WHAT OUR FRIENDS OF THE PRESS SAY ABOUT US.

An Acquisition.

The AMERICAN ANALYST, a recent acquisition to our exchange list, is an excellent weekly journal, devoted to the subject of pure food, exposure of adulterations of food, and the discussion of economic questions of every day importance. It gives a valuable list of household and cooking recipes each week. The price is very low, only \$1 a year.—*Throckmorton (Texas) Times.*

An Advantageous Change.

The AMERICAN ANALYST celebrated its fifth birthday recently by becoming a weekly instead of a semi-monthly publication. The change is much to the advantage of its patrons, both readers and advertisers, especially as the price of subscription remains the same as before. We are pleased to learn that this new departure is meeting with gratifying recognition.—*Commercial Union, Chicago.*

A SOFT VOICE.

THE CROWNING CHARM OF FEMININE BEAUTY.

We agree with that old poet who said that a low, soft voice was an excellent thing in woman. Indeed, we feel inclined to go much further than he has on the subject, and call it one of her crowning charms. No matter what other attractions she may have; she may be as fair as the Trojan Helen, and as learned as the famous Hypatia of ancient times; she may have all the accomplishments considered requisite at the present day, and every advantage that wealth may procure, and yet if she lack a low, sweet voice she can never be really fascinating. How often the spell of beauty is broken by coarse, loud talking! How often you are irresistibly drawn to a plain, unassuming woman, whose soft,

silvery tones render her positively attractive. Besides, we fancy we can judge of the character by the voice; the bland, smooth, fawning tone seems to us to betoken deceit and hypocrisy, as invariably as the musical, subdued voice indicates a genuine refinement. In the social circle how pleasant it is to hear a woman talk in that low key which always characterizes the true lady! In the sanctuary of home how such a voice soothes the fretful temper and cheers the weary husband! How sweetly such cadences float through the sick chamber, and around the dying bed; with what solemn melody do they breathe a prayer for a departing soul!

HIPPOPHAGISTS.

THE GROWING USE OF HORSEFLESH IN GREAT BRITAIN.

Horseflesh, it would seem, is much more extensively sold in England than the general public is aware of. A bill has been introduced into Parliament providing for absolute protection of the people from all fraudulent traders in the article. In every shop or stall where the meat is found for sale, the fact must be indicated by a painted sign, some four inches in length, indicating the fact. It is further provided that every purchaser, who has bought, without asking for horseflesh, shall be supplied with a label, on which shall be printed in legible letters, not less than an inch in length, the word "Horseflesh." Any infraction of the law is to be punished with a fine which may amount to \$100. Power is given to Justices to grant search warrants for suspected places; and health officers are authorized to make suitable inspections of meat when occasion calls for it. The flesh of asses and mules comes under the heading of "horseflesh." How is it in America? How is it in these United States? How is it in New York and Brooklyn? Possibly inquiry is pertinent. Thanks, however, to this being an agricultural country where beef is plentiful and cheap, and to our laboring classes, earning larger wages than those in Europe, we have no need of using horseflesh. But, another pertinent enquiry is suggested, the horse being a clean animal, much more so than the hog or chicken, what possible harm can there be in horseflesh?

CANNED GOODS FOR THE TROPICS.

THE EXPORT OF NORTHERN DELICACIES ENCASED IN TIN.

Progress in manufacturing has greatly increased the physical comfort of the tropical resident. No longer is he dependent for subsistence on the flesh, fish or fowl of the southern land. Though far on the other side of the equator, northern products, animal or vegetable, are within his reach; at the worst, with a slightly "tinny" flavor. There is a far greater quantity of fish sent to the tropics than any other class of canned goods. Within the past year very nearly half a million dollars worth has been exported to tropical lands, and this does not take into consideration those goods which were carried to Africa, etc., via England. Salmon is the popular variety; the consumption of other fish is small in proportion. It is caught in the Columbia River, and in other streams of British Columbia and Washington Territory, and canned and labelled on the spot. By far the greater part is carried to New York by rail, but good sized shipments go across the Pacific to Australia and Southern Asia, and British vessels take it around the Horn to England, whence a portion of it finds its way to Africa. Lobsters are dear to the man in the South and reach him by way of New York, after being caught on the coasts of New Brunswick, Nova Scotia and the adjacent provinces. The catch diminishing recently, the export has of late fallen off. Shrimps, another export delicacy, are caught in the Gulf of Mexico, largely on the coast of Mississippi. Instead

of being shipped directly from New Orleans to South America or the West Indies, they are sent via New York, whence they are dispatched southward. Oysters, which are sent down in goodly numbers, are packed and labeled in Baltimore, but they are seldom sent from there, as a general rule passing through New York. Thus New York becomes, from its great shipping facilities, the port of distribution and out-sending for the tropical export trade. Nowhere else is tonnage available, nor do lines of vessels run; nowhere else is there a surety of transportation. The export market is widening rapidly, and especially in the canned and preserved goods line, as is shown by the constant in-pouring and success of new brands upon the market. Besides fish there is a growing demand for canned fruits and vegetables, as peaches, pears, cherries, tomatoes (in a marked degree), corn and peas. This special branch, as well as that of condensed milk, of which large tropical shipments are being made, is yet in its infancy, but it shows promise of great expansion.

CLEANLINESS.

HOW TO GLORIFY THE SENSE OF LIVING.

An old physician, being once appealed to for some general, comprehensive rule for the preservation of good health, replied: "Keep clean." Cleanliness, from a medical point of view, generally means the absence of noxious germs. The laity generally comprehend in the term freedom from foreign substances, while the psychologist and moralist have reference to the purity of the mind and the soul. All these combined would form the first principle of good health. Freedom from all filth with reference to the body and its surroundings, freedom from contamination of mind and soul, would make the individual not only free from material pollutions, but would inspire him with a sense of cleanliness, a feeling of purity that would cleanse life and glorify the consciousness of living. There is a meaning in that word "clean" that penetrates beyond things seen and touches the mental and spiritual nature of humanity. Cleanliness in a material sense may not abhor dissipations and debauches which oppress life with a sense of impurity, vitiating the sources of health and impairing its enjoyment. "Keep clean" is an admonition carrying with it an inspiration which not only invigorates life, but makes it enjoyable and beautiful. Cleanliness brings not only comfort and health, but it adorns living, gives existence a charm, imparts consciousness of life, real enjoyment, thought, and feeling of existence, the purpose and sanctity of living. There is a world of meaning in the two words "keep clean." The physician, the psychologist, and the moralist united in that one advice would give to humanity a law of health, the observance of which would not only purify physical existence, but would inspire a consciousness of the enjoyments of life and animate it with its hopes, purposes, and destiny.—*Sanitary News*

LATENT COLOR.—In a recent communication to the Paris Academy of Sciences, M. G. Govi has brought forward some interesting facts as to the true colors of bodies. In general, if any substance is illumined by monochromatic light only, it will appear black, except when the color of the light is the same as that naturally transmitted or diffused by the material in question. Thus carmine is black when viewed by either green or blue light, ultramarine is black in all but blue light and similarly with most other colors. Reasoning from this, it would naturally be concluded that biniodide of mercury and red lead would appear black, when seen by the sodium light; which is almost a pure monochrome, whilst M. Govi's experiments show that in place of darkening, their color becomes a brilliant yellow, losing all trace of its initial red. Again, if biniodide of mercury and vermillion, which in ordinary sunlight appear nearly identical, are seen in the sodium light, the biniodide becomes a pale yellow, whilst the vermillion appears brown. M. Govi attributes the above to the fact that the sodium rays are wanting in sunlight and thus with it the true colors of these bodies do not appear.

DOMESTIC DIETETICS.

SPECIALLY PREPARED, FROM PRACTICAL TESTS, FOR THE
LADY READERS OF THE "AMERICAN ANALYST."

SEASONABLE FOOD.

March.

MEATS.—Beef, mutton, ham, kidneys, liver, venison, sausage, veal.

GAME AND POULTRY.—Grouse, hare, pigeon, chicken, duck, turkey, goose, snipe.

FISH.—Bass, cod, snipe, eels, carp, catfish, flounder, halibut, herring, lobster, mackerel, mussels, oysters, perch, pike, rock-fish, salmon, smelt, whitefish, trout.

VEGETABLES.—Artichokes, beans, carrots, celery, garlic, lettuce, onions, parsley, parsnips, potatoes, shallots, spinach, turnips, water cress.

FRUIT.—Apples, bananas, oranges.

PRACTICAL RECIPES.

SCOTCH BARLEY BROTH.—Throw three-quarters of a pound of Scotch barley into some clean water; when thoroughly cleansed, place it with a knuckle of veal in a stewpan, cover it with cold water, let it slowly reach a boil, keep it skimmed, add seven onions, and simmer for two hours; skim again, and add two heads of celery and two turnips cut in slices, or any shape it pleases the cook; add as much salt as required to make it palatable, and let it stew for an hour and a half—it must be well skimmed before the broth is dished; the meat must be previously removed and the broth alone sent to table. If it is intended to send the veal to table with it, dress it as follows: Take two pints of the broth and put it into a stewpan over a clear fire, add two tablespoonfuls of flour to the broth, and keep the broth stirring as you shake it in until it boils; then add a little cayenne pepper, two tablespoonfuls of port, boil for two minutes, strain it over the veal and send to table.

SCOLLOPED EGGS.—Boil eight eggs until they are hard; let them get quite cold, but do not put them in water to cool them; take them out of the shells and slice them; butter a baking dish, and sprinkle cracker crumbs over the bottom; put on this a layer of egg, and over it sprinkle pepper, salt, lumps of butter, and a few tablespoonfuls of cream; add another layer of crumbs, then of the eggs and seasonings till all are used up. Over all sprinkle cracker crumbs and a little grated cheese. Bake until it is a light brown, and serve at once.

CHEESE FONDU.—One pint sweet cream, one cupful grated cheese, three eggs. Beat the whites and yolks of the eggs separately; mix the cheese well with the cream and beat it slowly into the yolks; season with salt, cayenne and black peppers, and a tablespoonful of melted butter; lastly add the well-beaten whites, and bake in a rather slow oven for just twenty minutes, being careful not to open the oven door too soon, as the fondue will fall. Serve at once.

MOCK QUAIL.—Cut some tender veal cutlets into very thin slices about four inches square. Take a half pint of oysters, drain and just scald them over the fire; have ready two sweet breads, boiled and blanched; chop these up with the oysters; add a cup of cream, pepper, salt, mace and two tablespoonfuls melted butter; thicken with cracker crumbs till you can mould the mixture with your hands. Take the squares of veal, spread a thick layer of the mixture on each, and roll them up together with thread; stick two pieces of macaroni in each roll to look like legs, lay on a greased paper, and bake in a good oven. When done cut the threads and serve.

LEMON JELLY CAKE.—One and one-half cupfuls sugar, half cupful butter beat to a cream, three eggs well beaten, half cupful milk, two and a half cupfuls flour, two teaspoonfuls Horsford's baking powder. Bake in layers.

WOMAN'S MISSION.

WHAT SHE CAN DO—AND WHAT SHE OUGHT NOT TO DO.

As wife and mother, woman can make the fortune and happiness of her husband and children; and if she did nothing else, surely this would be sufficient destiny. By her thrift, prudence, and tact she can secure to her partner and to herself a competence in old age, no matter how small their beginning or how adverse a fate may be theirs. By her cheerfulness she can restore her husband's spirit, shaken by the anxiety of business. By her tender care she can often restore him to health if disease has overtaken his powers. By her counsel and love she can win him from bad company, if temptation in an evil hour has led him astray. By her example, her precepts, and her sex's insight into character, she can mould her children, however adverse their dispositions, into noble men and women. And, by leading in all things a true and beautiful life, she can refine, elevate and spiritualize all who come within reach; so that, with others of her sex emulating and assisting her, she can do more to regenerate the world than all the statesmen or reformers that ever legislated. She can do much, alas! perhaps more, to degrade man if she chooses to do it. Who can estimate the evils that women has the power to do? As a wife, she can ruin herself by extravagance, folly, or want of affection. She can make a demon or an outcast of a man who might otherwise become a good member of society. She can bring bickering, strife, and discord into what has been a happy home. She can change the innocent babes into vile men and even into vile women. She can lower the moral tone of society itself, and thus pollute legislation at the spring-head. She can, in fine, become an instrument of evil instead of an angel of good. Instead of making flowers of truth, purity, beauty, and spirituality spring up in her footsteps, till the earth smiles with a loveliness that is almost celestial, she can transform it into a black and arid desert, covered with the scorn of all evil passion, and swept by the bitter blast of everlasting death. This is what woman can do for the wrong as well as for the right. Is her mission a little one? Has she no worthy work, as has become the cry of late? Man may have a harder task to perform, a rougher road to travel; but he has none loftier or more influential than woman's.

BECOMING EXTINCT.—The alligator of the South, like the buffalo of the West, is likely soon to become extinct. The slaughter of the alligator for its hide, like the slaughter of buffaloes for their hides, has been so great that it will be only a few years before the lonely lagoon of Florida will have lost its last survivor.

ARTIFICIAL EMERALDS.—At a recent session of the French Academy of Sciences, Mr. Daubree, in behalf of Messrs. Hautefeuille and Perry, presented an interesting note on the production of emeralds. These learned chemists have succeeded in producing very beautiful crystals of emeralds by fusing silica, alumina and glucina (with traces of oxide of chromium) with acid molybdate of lithia. The materials were heated to a temperature of from 600 to 700 deg. for fifteen days. There were obtained, fifteen grams of small crystals about a millimeter in diameter, having all the mineralogical and physical characters of the natural emerald. The longer the operation is continued, the larger the crystals become.

THE NATION'S WARDS.—The Indian reservations in 1886 in the United States amounted to 212,466 square miles, all that is left to the race of 3,250,000 square miles, once all their own. The total Indian population of the United States is 247,761. Estimated number of Indians in Alaska is 30,000. The Indian agencies are 61 in number. Number of Indian church members in the United States is 28,663. Number of houses occupied by Indians is 21,232. Number of Indians living on and cultivating lands is 8,612. Number of Indians in the United States who wear citizen's dress is 81,621. Number of Indians in the United States who can read Indian languages is 10,027. Number of Indians in the United States who can read English is but 23,495. There are ten Indian training schools located in different parts of the Union.

FASHIONABLE WOOD.—Oak finished antique will be as much used as ever in the manufacture of furniture next year. It is the most popular of all the woods, and the demand for it is steady, and no signs of a change in popular favor are apparent. Walnut is nowhere in the race with oak for popularity, and furniture of that richest of all materials, especially for the bedroom, boudoir, and dining room, remains in the warehouses uncalled for and in no demand. Mahogany is used now, as it always was and will be, for the finest goods, and cherry takes a high rank, but oak stands first in favor and will continue in the front rank for another year at least, and probably much longer, as there is nothing to take its place. For the cheaper grades of furniture, ash, maple, birch, and these woods, with various stains and finishes, continue, as they always will, in favor.

WHY "ONE IS TAKEN AND ANOTHER LEFT."

Nothing is more fruitful of surprises to many persons, at this season of the year particularly, than the apparently trivial causes inducing severe and even fatal illnesses. "Just a little chill, hardly noticed at the time," ends in bronchitis, or perhaps pneumonia. "Digestion a little off, but nothing extraordinary," develops into a dangerous fever, a liver complaint or rheumatism. Cause seems altogether out of proportion to effect in such cases; but, in point of fact, the cause has been ample, and the blunder in contemplating it has been in confounding the primary and real cause with an apparent secondary, which may be in truth nothing more than an indication of the commencement of manifestation of effects. It is not the pointing of a gun at a man, or even pulling the trigger of the weapon, that kills him, but the preliminary loading of the gun with powder and ball. Nothing is more clearly logical than like causes, under like conditions, produce like effects. This being the case, two men, alike heated and similarly clothed, exposed to a draught of cold air together, either should both be made sick by it or should both be unaffected. But it doesn't work that way. One is taken sick and dies, while the other is left in the enjoyment of just as good health as he had before. What makes the difference? It is all in the second limb of the proposition—the conditions of the men are not alike. The one who lives, and is not even conscious that he had any threatening influence about him, has had strong vitality, the result of healthful vital organs and their product—pure blood. His abounding health has been a protecting armor of ample proof against such assaults as have laid the other man low. But what has been the condition of that other man? His liver was torpid, his kidneys were overtaken in their effort to do the liver's work as well as their own, and had pretty nearly retired from service, his bowels had grown sluggish, and his blood was clogged with effete matter, seeds of disease and death. He had, by his own neglect of proper care for his physical conditions, loaded the gun of Fate and aimed it at his life. All that was required was a little puff of wind, a little too heavy a dinner, a little too much exhaustion by mental or physical labor—and the trigger was pulled.

In this plain and homely illustration of the case every intelligent reader will see clearly why it is that the mortality from apparently trifling causes is so much greater in the Spring than at any other season. People have been getting ready all winter to invite the familiarities of the bony party with the hour glass and scythe. They have been eating more rich and heavy food than was good for them, because it was winter and they were in the habit of doing so whether the season was cold or not. They have been taking too little exercise, because the weather was so unpleasant for walking. They have perhaps been keeping irregular hours, and to some extent indulging in stimulants, because winter is the social season; and if one is in society it is thought to be necessary to keep up with the procession, even if alcoholic "bracing up" has to be resorted to. Well, winter is over and spring upon us, with her treacherous alternations of temperature, shifting winds, and varying humidity. It depends upon ourselves whether we follow that other man and go down to nourish the daisies,

or stay above ground to enjoy them. If, by the prompt and thorough employment of effective measures for restoring healthy conditions to our vital organs, we purify our blood and so increase our vitality, we have nothing to fear; but if we neglect doing so, we are only justified in apprehending the worst results. Fortunately, nature supplies the most efficacious remedies, and they are well known. The principal one is, of course, sarsaparilla, especially the Honduras variety of that plant, which is by far the strongest in its alterative virtues. With it should be associated the active principles of yellow dock, podophyllin, stillingia, and the iodides of iron and potassium. This compound is infinitely more certain in its beneficial effects than any other known to science. Owing to the volatility of its principal constituent alkaloid—sarsaparilla—its preparation by druggists and small manufacturers, whose business does not warrant them in employing the costly machinery required by the "cold process," is impracticable. It is however, prepared in perfection by one firm, that of J. C. Ayer & Co., whose "Compound Extract of Sarsaparilla" is of such uniformly high character that it has been adopted into the *materia medica*, and is now universally prescribed by physicians all over the world. All who value their health should use this medicine during the present season.

BINDERS FOR THE AMERICAN ANALYST.

We have selected the 'Handy Binder' for binding the ANALYST, because of the following advantages: It is elegant in appearance, strong, durable and this new method of binding allows the opening of the pages perfectly flat, owing to the fact that none of the side of the paper is used. This method also permits the taking out and replacing of one or more papers from any part of the file without disturbing the other parts. After the file is completed it ceases to be a temporary binder, and with its contents becomes a perfectly and strongly bound book. Owing to the unusual size and strength of the linen binding cord in combination with two metal-

lic binding strips (loops), the strength and durability of the binding is wholly unequaled by any method yet introduced. Price, sent post-paid, 75 cents. To any subscriber renewing his subscription at \$1 sent directly to this office, we will send one for 25 cents, and we will give one free as a premium for every new subscription sent to us with \$1.

BUSINESS NOTES.

GELATINE.

Gelatine is a peculiar substance and must be manufactured by a person who by long experience and conscientious care makes it good. While to a limited extent it partakes of the nature of glue, good gelatine cannot be made where the manufacture of glue is carried on. An ill smell will not hurt glue, but does hurt gelatine. If gelatine is not perfectly sweet and pure, it is valueless. Let the housewife buying gelatine remember always to buy a brand which is not made in a glue factory, and she will never need to drown the offensive odor with essences or sherry wine. Chalmers' gelatine is the only American gelatine not made in a glue factory.

ANOTHER LARGE FACTORY IN BROOKLYN.

The large Rock Candy and Syrup manufactory of Dryden & Palmer, now located in Baltimore, will be removed to Brooklyn on May 1st. They will occupy the extensive buildings covering nearly a block, on Wythe Avenue, corner of North Third Street, in the Eastern District.

THE Y. P. M. WHISKEY.

A casual inquiry of one of the clerks in Acker, Merrill & Condit's store elicited the fact that this old brand has become the favorite. When asked the reason, he said that it was always the same and perfectly straight. At

Park & Tilford's the clerks said that there was more Young Whiskey sold than any other brand. This surely must be gratifying to Alexander Young Sons' Company. Yet strange to say we have been credibly informed that this house has had to refuse to fill orders from other parts of the country because their stock of seven-year old whiskey is getting low.

HORSFORD'S ACID PHOSPHATE,

BEWARE OF IMITATIONS.

Imitations and counterfeits have again appeared. Be sure that the word "Horsford's" is on the wrapper. None are genuine without it.

WHAT NEXT?—A late patent granted will bear the sign "Put a nickel in the slot and have your picture taken," the sensitive plate being exposed and then carried through the developing and fixing solutions by the mechanism set in motion by the nickel in falling.

POLAR FLOWERS.—Within the antarctic circle there has never been found a flowering plant. In the arctic region there are 762 kinds of flowers. Fifty of these are confined to the arctic region. They are really polar flowers. The colors of these polar flowers are not as bright and varied as our own, most of them being white and yellow, as if borrowing these hardy hues from their snowy bergs and golden stars.

BOSTON MILK SUPPLY.—In no city of the United States is the food supply more carefully watched than in Boston. The inspector of milk of that city has just made his thirtieth annual report, which covers the work performed by him during the year 1888. From this report it appears that 915,867 more gallons of milk were sold in 1888 than in 1887, and notwithstanding this increase, the quality was much better. In 1883, 60 per cent. of the milk examined was found to be below the standard fixed by law. In 1884, only 40 per cent. was below; in 1885, 30 per cent.; in 1886, 18 per cent.; in 1887, 12 per cent.; and in 1888, but 8 per cent. The inspector justly claims this great improvement as the result of the labors of his department.

LOOK OUT for Imitations and Substitutes OF *Horsford's* ACID PHOSPHATE.

A variety of imitations and substitutes of this standard preparation have appeared under the name "Acid Phosphate," or a similar title, all of which differ materially from the genuine article.

Be sure the name "**HORSFORD'S**" is on the label. No other genuine.

At all druggists, and 224 William St., New York.

LACTOPEPTINE.

The most important remedial agent ever presented to the Profession for Dyspepsia, Vomiting in Pregnancy, Cholera Infantum, Constipation, and all Diseases arising from imperfect nutrition.

Lactopeptine precisely represents in composition the natural digestive juices of the Stomach, Pancreas and Salivary Glands, and will, therefore, readily dissolve all foods necessary to the recuperation of the human organism.

CAUTION

We regret that we are compelled to caution the profession in prescribing Lactopeptine, but very careful investigation has proven to us clearly the necessity of it. Substitution of cheap and worthless compounds are being made in many cases where Lactopeptine is prescribed.

Lactopeptine is always UNIFORM, and its effects are SPECIFIC, and no one has ever been able to imitate its digestive value. If you do not obtain positive results when you prescribe Lactopeptine, you can be sure that some substitution has been made, and in such cases it may be necessary for the physician to prescribe Lactopeptine in the original ounce package to insure certainty of obtaining the genuine article. We can confidently make this assertion, knowing the scrupulous uniformity in digestive value of every ounce of Lactopeptine.

Lactopeptine has always been kept strictly in the hands of the Medical Profession, never having been admitted in any publications but Medical Journals. It is prescribed by the most intelligent and educated physicians in all parts of the world, and there are but few physicians who have ever used Lactopeptine that will not agree with the late Prof. L. P. Yandell, when he says: "Lactopeptine is one of the certainties in medicine, and in this respect ranks with Quinine."

In the various forms of Dyspepsia, in vomiting in Pregnancy, and in Mal-nutrition of children, there is no known remedy so positive in results.

THE NEW YORK PHARMACAL ASSOCIATION, NEW YORK.

A BUSINESS BENEFIT.

ADVANTAGES TO ADVERTISERS OFFERED
BY THE AMERICAN ANALYST.

It has not the limitations of a daily paper. No one reads yesterday's paper. A monthly lives at least a month, while a semi-monthly is fresh twice a month, and its audience is not limited by geographical lines, but the circulation is all over the United States and Canada.

It contains matters of interest to everyone, especially the ladies of the household, and is, therefore, sure of a careful perusal. Our audiences are intelligent and of the better classes, who have money to spend, and any well worded advertisement in our columns, giving real information, will receive a careful perusal.

Our rates are as low as our circulation affords. Large circulation and original matter cost money, and those advertisers who desire to realize these benefits must expect to pay reasonably for them.

Advertisements in our columns are permanent. Most of our subscribers bind their numbers.

Our advertisements are set up in an attractive form, sure to call the attention of the reader.

Anything that our readers want, or for which a demand is to be created, not wholly of a local nature, will pay to advertise with us.

We take only advertisements from legitimate houses of really meritorious goods, and give them all the editorial assistance they deserve; consequently our readers knowing this, have confidence in advertisements contained in our columns.

The fact that we have the best and largest houses in every branch of trade advertising with us, and that they always renew as their seasons arrive, proves beyond a doubt that they have found the AMERICAN ANALYST a good advertising medium. Why should not you?

MALTED MILK

THE ONLY FOOD

For Infants and Invalids

THAT CONTAINS ALL THE ELEMENTS OF NUTRITION, WITHOUT
A SINGLE ADDITION.

MALTED MILK does not have to be cooked.

MALTED MILK needs no addition of milk, only to be stirred up with water, which can be done without the slightest fuss or trouble.

MALTED MILK will not spoil in hot weather.

MALTED MILK is always ready for immediate use night or day, when traveling or at home.

MALTED MILK does away with the danger of using sour or impure milk.

MALTED MILK is free from starch and cane sugar. All foods that have to be cooked contain starch.

Ask your physician his opinion of MALTED MILK, he knows all about it.

Price, . . . 50 Cts. | Large Size, . \$1.00

Extra Large Glass Jars for hospital and family use, ... \$3.75

These contain five times the quantity of the \$1.00 bottles.

A sample bottle will be sent free to any Mother or Invalid sending their address to

MALTED MILK CO.

RACINE, WISCONSIN, U. S. A.

OUR MISSION.

WHAT THE AMERICAN ANALYST IS DOING

FIGHTING ADULTERATION.

The steadily growing favor which the AMERICAN ANALYST is constantly receiving at the hands of both the reading and the business public is the best evidence that could be afforded of the useful field of effort it occupies. It was the pioneer journal in this country to take up the fight against adulteration, and stands to-day, by public acknowledgment, the only competent exponent of the principles involved in that momentous struggle. To this end the realm of sophistication and fraud has been thoroughly explored, and its corruptions, as far as practicable, exposed to the public view. Charlatans, adulterators, and handlers of poisonous food have been summarily and uncompromisingly dealt with. Humbugs seeking to enrich themselves, through the sale of high-sounding specifics for human ailments, have been subjected to the crucial test of thorough chemical analysis of their goods, and where the latter, as too frequently occurred, proved to be utter frauds in name, composition, and pretended effects upon the system, the real facts have been placed before our readers in order to save the public from further unconscious imposition. The veil of chemical mystery in which tricksters of this kind ostentatiously envelop their processes of manufacture, protects them as yet from the criminal laws to which other confidence operators are held amenable, and the only method for counteracting their nefarious schemes is through public exposure by the newspaper press. In exposing this species of fraud, the AMERICAN ANALYST has conferred a benefit upon the community, to which the latter is giving grateful and substantial recognition.

SANITARY AND FOOD REFORMS.

In addition to the foregoing, the AMERICAN ANALYST is in constant co-operation with the Boards of Health of this and other cities, in efforts to secure sanitary and food reforms through organized methods, and while it is nobody's mouthpiece, it is conceded to be the only pop-

ular medium through which those bodies can bring their purposes and action intelligently before the general public. Reaching as it does all classes, manufacturers, merchants, physicians, chemists and private families all over the land, its influence is exerted over a vast radius, producing results as visibly marked as they are widespread.

DOMESTIC DIETETICS

Is a department of special interest to ladies. It is very different and far superior to the ordinary cookbook, in that it tells the housewife suggestively what to buy, what foods are in season, as well as how to prepare the many varieties of dishes, all in a practical way easily followed. Other matters of great interest to housewives are also discussed.

PRACTICAL DISCUSSIONS.

Numerous other interests are also faithfully represented in our columns, such as articles relating to common experiences of society, the question of hygiene, and an infinite variety of practical subjects. In short, the AMERICAN ANALYST also keeps abreast in giving the fullest information on all matters directly or indirectly in the line of its proper field.

SCIENTIFIC INVESTIGATIONS.

The business transacted in the office of the AMERICAN ANALYST does not by any means all come to the surface in the pages of the paper. Minute analyses of chemical compounds, careful assays of minerals, examinations of questionable oils or doubtful condiments, and the many subtle operations incident to laboratory work are constantly required of us by correspondents far and near, and the results in many cases are not publicly recorded. In this manner, the influence of the paper encompasses a vast radius, from every point of which we receive constant expressions of approval, verbally, and in more substantial shape.

ITS VALUE TO ADVERTISERS.

No person can scrutinize the advertising pages of this journal without being impressed with the uniform high character of the numerous houses who find our columns the most desirable—because the most effective—medium for advancing their interests throughout the country in the several directions to which they respectively pertain. The steady growth of our subscription lists, extending to every State in the Union, and in fact all over the world, affords another gratifying evidence of the approval given to our endeavors to sustain genuine manufactures, and to expose spurious, fraudulent, and harmful knavery.

SUBSCRIPTION \$1 PER YEAR.

Considering the amount of practical information regularly embodied in its contents, together with the fact that the subscription price for an entire year is only one dollar we believe the day is approaching when the AMERICAN ANALYST will be regularly welcomed in every intelligent household in the land. Address,

ANALYST PUBLISHING CO.,

19 Park Place, N. Y.

AN INCH OF RAIN.—An "inch of rain" means a gallon of water spread over a surface of nearly two square feet, or a fall of about 100 tons on an acre of ground.

SUBMARINE BOAT.—A boat has been recently devised by M. Goubet, a civil engineer of Paris, and has been submitted to the test of experiment at Cherbourg. This boat is 6 metres long and 1 metre and a half wide. It is entirely made of bronze, and its weight is 10,000 kilogrammes. It is also cigar-shaped, and at the roof a small observatory, with thick glass, protrudes to allow of observation, whether under or above the level of the sea. Two men compose the crew. The boat has been down to 13 meters depth very easily, and has well supported the tremendous pressure of 260,000 kilogrammes exerted on its surface at this depth. The uses it will be put to in naval war will be determined later, after new experiments on the subject. The time during which the crew may remain in the boat without experiencing any inconvenience is eight hours.

A NEW USE FOR LIQUID PEPTONOIDS.

Successfully used in Dissolving the False Membrane in Diphtheria.

A Physician writes: "In an experience of over thirty years I have never used anything to equal your LIQUID PEPTONOIDS as a local application with a spray. It will dissolve the membrane and destroy the diphtheretic odor in less than twenty-four hours. I use the LIQUID PEPTONOIDS full strength, as a spray, two or three times a day, in bad cases."

Used successfully by another physician in two desperate cases:—"I was induced to try LIQUID PEPTONOIDS in two very desperate cases of DIPHTHERIA. I think I never saw throats more heavily coated with exudate than were these, and I think I never saw it more rapidly disappear than in these cases, by frequent spraying with your LIQUID PEPTONOIDS."

LIQUID PEPTONOIDS can be taken by patients unable to ingest food in any other form. In dyspepsia and loss of appetite its effects are positive, its digestive properties assisting in the digestion of food taken and its peptogenic properties quickly stimulating the natural digestive secretions of the stomach.

PANCROBILIN.

Prepared (in both Liquid and Pill form) from Extract of Pancreas and Bile.

This preparation is designed expressly to increase the digestion and absorption of fats.

We believe that the fat-digesting properties of pancreatine and bile are inseparable, and that without their union in the intestinal tract but little, if any, fat would be digested and absorbed.

PANCROBILIN will be found of great service in Phthisis and other wasting diseases, Nervous Prostration, Constipation, Inanition, Malnutrition, Intestinal Indigestion and wherever there is a failure to assimilate fats.

If the skin is first wet with LIQUID PANCROBILIN, the inunction of oils will be greatly facilitated.

LIQUID PANCROBILIN is put up in pound bottles. PILL PANCROBILIN is put up in bottles holding 100 pills. The coating of the pills will resist acid digestion, when given as directed, but will be quickly dissolved in the alkaline secretions of the duodenum.

PHOSPHO-CAFFEIN COMP.

(Granular Effervescent.)

Formula for each dessertspoonful:—

Caffein.

Acidi Phosphorici aa, grains, ss.

Antipyrin.

Ext. Apii. Grav. dulc. (Celery), aa grains, j.

Sodium Bromide, grains, v.

The satisfactory results produced by PHOSPHO-CAFFEIN COMP. in Headaches, Neuralgia, Insomnia, Neurasthenia and general Nervous Irritability, are not due to the effect of any one ingredient, but to the happy effect of the combination. A thorough series of comparative tests have demonstrated the superiority of the above formula over any other in the market.

REED & CARNRICK, New York.

PEACOCK'S BROMIDES

(SYR: BROM: COMP: PEACOCK)

NERVE SEDATIVE.

Each fluid drachm represents 15 grains of the Combined C. P. Bromides of Potassium, Sodium, Calcium, Ammonium and Lithium.

USES:—EPILEPSY, and all CONCESTIVE, CONVULSIVE, and REFLEX NEUROSES.

This preparation has stood the test of time and experience, and can be relied upon to produce results, which can not be obtained from the use of commercial bromide substitutes.

DOSE:—One to two FLUID drachms, in WATER, three or more times a day.

The AMERICAN ANALYST will send to any person who will forward a New Subscription with One Dollar, a copy of

THE FAMILY CYCLOPÆDIA OF USEFUL KNOWLEDGE.

This is unquestionably one of the most interesting, entertaining and instructive books ever published. It is a universal educator for every member of the family circle, filled with useful information from beginning to end, and this information is given in such an attractive and pleasing way that the book is quite as entertaining as it is instructive. It treats of hundreds of subjects of which no man, woman or child who seeks to be well informed can afford to be ignorant, yet of which the masses of people are entirely unlearned. It contains the cream or substance of a dozen ordinary volumes, and is one of the most valuable and useful books a family can have in the house. No living man is so well informed that he may not learn from it. It is a book for the masses, for old and young, rich and poor, and will be read with pleasure and profit by all. It will likewise be found of great value as a work of reference. The book is profusely and elegantly illustrated, and is conveniently divided into departments, as follows: **Biography, History, Natural History, Travels, Manners and Customs, Etc.; The World Illustrated, Useful Arts and Manufactures, Trees, Plants, Fruits, Etc.; Great Inventions, Mining, Wonders of the Sea, Familiar Science, Law for the Masses, Statistical and Miscellaneous.** All the above subjects are fully and ably treated in this valuable book. It is a vast storehouse of useful and entertaining knowledge—unquestionably one of the best and most valuable books ever published in any land or language. No cyclopædia ever heretofore published at twice the cost is to be compared with this book in point of artistic make-up, beauty, and excellence of illustration, and quality of contents. As a holiday or birthday present for any one, nothing more appropriate or acceptable could possibly be selected. **THE FAMILY CYCLOPÆDIA OF USEFUL KNOWLEDGE** is a large and handsome book of 544 pages, 12mo, printed upon fine paper and elegantly bound in cloth, embellished with artistic designs in black and gold. It contains **Two Hundred and Seventy-three Beautiful Illustrations**, the original cost of which was over \$5,000. The book will be sent by mail, post-paid, to any person sending a **New Subscription with One Dollar.** It is as large and handsomely gotten up as books usually sold at \$1.50 and \$2.00, and in the quality of its contents is worth a dozen ordinary volumes.

ADDRESS ANALYST PUBLISHING CO.,

—19 PARK PLACE, NEW YORK.—

Tabasco Pepper Sauce

OR LIQUID PEPPER.

Is simply the Pulp of the Ripe Pepper Extracted by Pressure.

The seed of this Pepper was obtained from Central America, and by careful cultivation in Louisiana for many years has been so improved in strength, flavor and aroma, as to have become a new variety of Red Pepper, superior to all others. The pulp is so handled as to retain all the flavor, strength, aroma and color of the ripe fruit, and to keep unimpaired in any climate. It excites the appetite, promotes digestion, and is pronounced, by connoisseurs, to be the finest condiment in the world. For medicinal purposes it recommends itself by its purity, strength and diffusible form.

Manufactured by E. McILHENNY,
NEW IBERIA, LA.

For Sale by all Wholesale Grocers.

NATRONA BI-CARBONATE OF SODA.

(ABSOLUTELY PURE.)

The nature of the raw material from which NATRONA BI-CARBONATE OF SODA is made—viz., kryolith, a mineral containing *pure sodium*—insures a purity and uniformity of product which cannot be obtained from any other known material. In making BI-CARB. Soda from any other raw material, the use of sulphuric acid is a necessity, but none is used in any part of the process of making NATRONA BI-CARB.; hence its entire freedom from the slightest trace of arsenic, which is always present in ordinary soda. Its absolute purity and entire freedom from all traces of *sulphate of soda*, common salt and other impurities, render NATRONA BI-CARB. NEARLY TASTELESS, and being bolted through the finest bolting-cloth, insures the finest stage of division.

To these indisputable facts the attention of CONSUMERS of soda is specially called. They are IMPORTANT, and should influence both those who use and those who sell soda, to buy and sell NONE BUT THE BEST.

The NATRONA BI-CARB. Soda is kept in stock by almost every wholesale druggist and grocer throughout the United States, of whom it may be ordered.

Natrona Bi-Carb. Soda is unequalled by any other brand of English or American Manufacture.

PRICE BAKING POWDER CO.
 NEW YORK. CHICAGO. ST. LOUIS.

COLDEN'S LIQUID BEEF TONIC.

AN INVALUABLE AID IN THE TREATMENT OF
ALL CASES OF DEBILITY.

Established 15 Years. Endorsed by Scores of Physicians.
Essentially Different from all other Beef Tonics.
Beware of Imitations.

COLDEN'S LIQUID BEEF TONIC consists of the Extract of Beef (by Baron Liebig's process), spirit rendered non-injurious to the most delicate stomach by extraction of Fusel Oil, soluble Citrate of Iron, Cinchona, Gentian and simple aromatics. An official analysis of this preparation by the eminent chemist ARTHUR HILL HASSALL, M. D., F. R. S., and an endorsement by SIR ERASMUS WILSON, F. R. S., is printed on the label of each bottle.

Its Range of Action Embraces all Cases of Debility.

By the urgent request of several eminent members of the medical profession, I have added to each wineglassful of this preparation two grains of SOLUBLE CITRATE OF IRON, and which is designated on the label as "No. 1," while the same preparation, without Iron, is designated on the label as "No. 2." It acts directly on the sentient gastric nerves, stimulating the follicles to secretion and gives to weakened individuals that first pre-requisite to an improvement, an appetite.

I will, upon application, send a sample bottle of Colden's Liquid Beef Tonic to any physician in regular standing. Please ask your Dispensing Druggist (if he has not already a supply) to order it. In prescribing this preparation physicians should be particular to mention "COLDEN'S" viz: "EXT. CARNIS. FL. COMP. (COLDEN)." It is put up in pint bottles and can be had of Wholesale and Retail Druggists generally throughout the United States.

THE PACKED ST. LOUIS CONVENTION.

The Governor of Kansas, for some reasons best known to himself, some weeks since invited several neighboring States, including Colorado, Iowa, Minnesota, Kansas, Indiana, Texas, Missouri, Illinois and Nebraska, to send members of their respective legislatures as delegates to meet in convention at St. Louis on March 12th, to inquire into the alleged combination or trust, so-called, of Chicago beef dressers. Such a convention, called for such a purpose, would naturally be composed of opponents to the Chicago beef dressing interest. The convention was held, and, strange to say, the Associated Press, while it reported its first meeting and gave a list of the officers elected, never again referred to it, not so much even as to report the result of its proceedings. In a word, the much-talked of anti-beef dresser convention was entirely ignored. Why this was so becomes apparent when we read in one of the alleged butchers' organs what was actually done by the convention. They elected State Senator Frank E. Gillette, of Kansas, chairman. This is a man to whom the very mention of Chicago beef is like a red rag to a mad bull. That subject, however, for which the convention was

ostensibly held, was not admitted into the discussion. When a delegate from Iowa innocently introduced a resolution, directly in the line of the pretended purpose of the convention, to memorialize Congress for a law protecting local butchers and cattle raisers against the Chicago slaughterers, a perfect pandemonium broke loose, and the resolution was speedily buried out of sight. Another resolution still more to the purpose, to at once proceed to investigate the existence of the alleged meat or beef combine, was in like manner instantaneously sat upon and referred to the committee for burial. A third resolution in favor of a rigid anti-trust bill nearly met with a similar fate, for after considerable changing, it was adopted by a majority vote. The climax was reached, however, when the negro in the fence was at last uncovered. A bill similar to the Nebraska State inspection bill, which is clearly unconstitutional, was offered for consideration, and was railroaded through to adoption by a vote of 45 to 25. This evidently having been the sole purpose of this meeting, it adjourned at once. It is worthy of note, however, that even in this packed convention there were twenty-five men out of seventy who had enough common sense and self-respecting manhood to vote against such a foolish and iniquitous measure.

PHILADELPHIA FOOD INSPECTION.

At a recent meeting of the Philadelphia County Medical Society, the following resolutions were adopted and referred to a committee consisting of five prominent physicians: "The Philadelphia County Medical Society begs to call the earnest attention of city councils and the Legislature of Pennsylvania to the pressing need of provision for the inspection of all meat and milk used as food, with a view of furnishing sound meat and milk to the people. The society would also urge the necessity of killing and destroying all animals afflicted with tuberculosis, and the owner should be indemnified by the State. The society also recommends that a committee of five be appointed by the president of the society, whose duty it shall be to represent the society with a view of obtaining further information, and to confer with other bodies acting in this matter." Dr. Strawbridge, who introduced the resolutions, said: "Statistics as reliable as can be obtained make the statement not too broad, that in Philadelphia, about the present time, there is from three to three and one-half per cent. of tuberculosed meat used, and from six to eight per cent. of tuberculosed milk. Here in Philadelphia to-day there is no inspection of any kind. The best the board of health could do was to obtain an appropriation of fifteen hundred dollars for the appointment of a milk inspector, who will probably start to the stations to see how much water goes into the milk. Anybody can dump any kind of food in Philadelphia, and we must take it; but if we refuse to eat it, we are told that we are not good citizens. Meat ought to be inspected when alive, and also during the process of slaughtering. Unless you can inspect the animal alive, and also when

the internal parts can be viewed, the inspection is useless. In the inspection of milk, the principal thing is to see the cows that give it, so that they are not diseased, and to inspect it at its place of delivery."

LOCAL INSPECTION AND RINGS.

The *Merchants' Mail*, of Albany, strikes the nail on the head in the following retort to an attack upon Chicago dressed beef by one of our local contemporaries: "The *Butchers' Advocate* of New York grows frantic in its efforts to persuade its readers that Chicago dressed beef is unwholesome, not fit to eat, and people do not know what they are eating when they have it upon their tables. Such ranting is the worst kind of bosh and no intelligent man for a moment will give it any consideration. As far as health is concerned, we prefer a thousand times Chicago beef to home dressed, and so does the majority of consumers. If this were not so the great majority of butchers in this State would not handle Chicago beef. If the *Butchers' Advocate* wants to make friends for their side of the case it must change its tactics. We do not know anything about the butchers in New York City, but we do know something about them up this way. They may possibly have hayseed in their hair; but all the same they know there is no better inspection in the country than that carried on by the Chicago men and so does every other well informed man. These Western men invite anyone that so desires, to come and investigate their inspection. If the *Butchers' Advocate* is right, the public, long ago, would have found out something was wrong and would have remedied the evil mighty quick. The consumer wants Chicago dressed beef; first, because it is healthier and, secondly, because it is cheaper, acting as a leveler in keeping the price of meat down. The consumer doesn't propose to have any more West Albany rings to send the price of meat skyhigh and don't you forget it."

LIBRARIES AND INFECTION.

We have several times alluded to the possibility of infection being transmitted through the instrumentality of the books of circulating libraries. In its issue of March 8th, *Science* discusses briefly the same theme, with a distinct enunciation of the warning which we have been criticized for urging upon the managers of those institutions: Subscribers of public libraries have of late been warned against the danger of contracting contagious diseases from books which have been in houses where these diseases existed at the time. The health authorities of Dresden have been examining the dust which had accumulated on unused volumes, with reference to the discovery of micro-organisms, and especially the bacillus of tuberculosis. They report that they have found nothing of a harmful character, and have arrived at the conclusion that the danger of spreading infection by means of circulating libraries is very slight. They recommend, however, that books should be well dusted

before being read, and that the fingers should not be wet in the mouth in order to turn the leaves. If the experiment is correctly reported, the authorities of Dresden are not justified in deducing any such inferences. The material which may accumulate in the form of dust on "unused books," and that which may collect on books in infected rooms, are of a totally different character. To determine the danger from the use of these latter books, another series of experiments must be made, and, in the present state of our knowledge as to the germs of infectious diseases, not much could be expected even from such experiments. The germs of measles, scarlet fever, and small-pox, which diseases are known to be propagated by articles of wearing-apparel which have been exposed in infected rooms, have never been recognized, and the search for them in the dust which has collected on books would doubtless be as futile as it has been elsewhere; but there is no *a priori* reason why such books might not be carriers of contagion equally with clothing and furniture. The advice given to dust books well before reading them, in order to avoid danger, is, if the Dresden authorities are correct in saying that such dust is harmless, entirely unnecessary, while, if the dust should be infected, it would be the best possible way to spread the infection. Books which have been in an infected room, especially if they have been opened, should be destroyed. It is practically impossible to disinfect them.

MEDICAL FRAUDS.

The weather has been so uniformly mild throughout the past winter that any exhibition of coolness nowadays has a refreshing influence. But the Polar frigidity of some of the medical frauds of this community is calculated to induce a greater degree of nervous excitation than is wholesome, particularly in the system of a newspaper publisher. For example, we are in receipt of a letter from a so-called "Remedy Company" having its head-quarters within a few blocks of the Post Office, whose tricky devices and untruthful claims should debar it from recognition by any self-respecting journal in the country. The concern referred to, like all of its ilk, is an extensive advertiser, and about a year ago the AMERICAN ANALYST narrowly escaped from becoming one of its victims. We received through an agency in the city a contract for advertising a catarrh remedy, which, on its face, appeared to be a genuine thing, but which, after the lapse of several weeks, we discovered to be one of those ingenious frauds in which the patient responding to the advertisement receives a gratuitous recipe, of which one, at least, of the ingredients he finds himself unable to obtain of any druggist. His only resource is to buy it from the advertiser, and the alleged drug being claimed to be of great rarity he is compelled to pay a large price for it, only to increase the worthlessness of the compound to which it is added. As soon as we had our attention directed to the trick we investigated it, and the result was we promptly canceled our contract with the agency. Some months later, during last fall, we received from the same agency an advertisement for monthly insertion of a medicine which in this instance was to be furnished gratuitously, bottle and all. The fact transpired, however, that the alleged "doctor" advertising this remedy was identical with the one, though by another name, whose recipe fraud we had rejected, and we repudiated this second venture, as we had the other one, besides administering a rebuke to the agency which had lent itself to the dishonest scheme. It turned out as the result of our investigation that there are half a dozen of these charlatan devices for deceiving the public all advertised extensively, and each ostensibly belonging to a different proprietor, but all, in fact, owned by one concern which seeks to divert suspicion by operating under a variety of aliases. In spite of our emphatic repudiation of the scheme, we have before us, as stated above, a communication in which the barefaced assertion is made that the "recipe"

above referred to has been advertised in our columns "every year, at least seven months out of the year, the last five years," and that the "medicine" advertisement has been in this paper "numerous times during the last two years." In consideration of the extensive favor thus inferentially conferred upon us, we are requested to give gratuitous insertion to an editorial recommendation of the quackery "as long as our kindness lasts." We have reached that limit now. The partnership is herewith dissolved. This is the last notice we propose giving the cool fraud under consideration, gratuitously or otherwise, unless its effrontery shall sometime provoke us into denouncing it by name. We avoid specifying at present the various designations under which it cloaks its tricky methods, for the reason that we prefer, if it can be avoided, not to impart to it the credit, unenviable as it is, of being openly named in our columns. Moreover, our readers cannot err to their disadvantage if they recognize the tricksters we are denouncing in any and every one of the too numerous announcements everywhere displayed of wonderful specifics and remedies tendered to suffering humanity by disinterested humanitarians. All these announcements are, in the idiom of the street, "snides," and both health and pocket-book will be benefited by their scrupulous avoidance. If the patient insists upon using proprietary medicines, let him be careful to use such only as bear the stamp of honorably accredited manufacturers. A good thing in that line speedily makes itself known. An unknown remedy should be shunned as poison.

ENFORCING PURE FOOD LAWS.

We referred recently to the complaint of the government examining officer in Washington regarding the failure of the District of Columbia anti-adulteration law to accomplish its purpose. The subject has attracted considerable attention from the advocates of restrictive legislation of this salutary kind and the opinion of the government official above mentioned, that the law is ineffective because the public is indifferent on the point of food frauds, has been variously criticized. We think that he is only partially correct. Whatever may be the apathy of the public concerning the imposition practiced upon it, experience has almost infallibly shown the impossibility of inducing the irresponsible citizen to do the work that belongs ordinarily to the detective. Almost any law against any vice or wrong will fail which depends upon voluntary or unpaid for evidence. The truth is that the public will not do detectives' work. It was a great mistake, therefore, to enact a pure food law for the District of Columbia and not to provide with it the proper machinery for putting the law into operation. The Massachusetts law is effective because its machinery for working is complete. The New York law is largely a failure because the law as a whole is a poor one. What every State needs, and what the country needs, is pure food legislation which shall do for the foods and medicines industry just what any sensibly framed legislation does, that is, provide not only the law but the officials who shall watch for its violations, gather the needed evidence and enforce the proper penalties. The picture of the government officers sitting at their desks in Washington with a pure food law before them, waiting, perforce, for a good natured, easy going, selfish public to come in with the evidence that must be forthcoming before the law can be put at work is rather ridiculous even in these times so abounding in absurd things.

A REMARKABLE METEOR.—At Oswego, N. Y., one night recently, a large and brilliant meteor was seen. It appeared in the southern sky about ten minutes past 9, 25 degrees above the horizon. It seemed about twice the brilliancy of Venus. It moved horizontally from west to east with the apparent speed of a rocket. It grew in size as it moved, and in the southwest broke into three balls, each larger than the whole when first seen. Just before breaking it showed a red tinge, and after separation each part showed vivid green like the characteristic flame of copper.

ELECTRIC CAR HEATING.—The Grand Trunk Railway is preparing to make a practical experiment with the electric car-heating apparatus invented by Mr. Roe Fuller, an employe in the Grand Trunk shops. It consists of a dynamo placed in the baggage car, power being taken from the moving axles. A metal bar is placed in a tank of water in each car. Pipes from the tank extend all around the car. The metal bar is to be heated by an electric current, thus heating the tank and pipes.

EELS' BLOOD.—M. Mosso, of Turin, having carried out a series of experiments with the blood of eels, finds that it possesses marked poisonous properties. Even to the tongue it has an insupportable acidity, and a very small quantity of the serum is sufficient to kill a dog. Half a cubic centimetre injected beneath the skin of a dog weighing thirty-five pounds killed it in four minutes. At this rate an eel weighing five pounds would contain enough poison to dispatch ten men. The blood of animals thus poisoned cannot be made to coagulate as after the bite of serpents. Fortunately the blood is inert when introduced via the stomach, and it loses its toxic properties when heated.

A VENTILATING TAP.—An English mechanic has invented a ventilating tap for preserving beer and other liquids. The object of this tap is to overcome the difficulties experienced by all keeping beer, wine, etc., in their houses, when by carelessness or accident a quantity of liquid is frequently wasted or spoiled by the vent peg being left out. This tap is so constructed that when the liquid is forcing the key should only be turned quarter round, which allows the liquid to be drawn; but when vent is required to be turned half way, which will only admit as much air as is necessary to allow the liquid to run, and by the act of turning off the liquid at the same time it effectually shuts off the vent.

THE MEDAL OF EXCELLENCE

has recently been awarded to

BY THE AMERICAN INSTITUTE, OF NEW YORK.

The Judges of Award being

DRS. DAVENPORT, WOODWARD and MILLER,
Three Prominent Dentists of New York City.

Examine its construction, ascertain its results, and you will use no other.

A Perfect Polisher. Thorough Cleanser.
AT ALL DRUGGISTS.

Its Economy. Holder (imperishable) 35 cents. Polishers only need be renewed. 18 (boxed) 25 cents. Dealers or mailed.

HORSEY MFG. CO., UTICA, N. Y.

The Only Perfect Substitute for Mother's Milk.

A Copy of our Book,

will be MAILED FREE to any address.

DOLIBER, GOODALE CO.,

40-41-42-43 Central Wharf, Boston, Mass.

WORTH, THE DRESSMAKER.

THE GREAT PARIS MODISTE RELATES HIS HISTORY.

PARIS, Feb. 13, 1889.

In its issue of March 8th, the *Boston Transcript* publishes the following communication from the famous Worth, in which our lady readers will doubtless take special interest:

I fear that the American public will scarcely find the facts of my career of sufficient interest to merit recording; but as I am assured that my name and my establishment are better known in the United States than I have heretofore imagined, I yield to the persuasions of an old American friend, and will set down at random some fugitive reminiscences. To this I consent the more readily, as many of the statements concerning me which have been published in the American papers are more or less erroneous. I am, as is, I believe, well known, an Englishman. I was born in the town of Bourne, in Lincolnshire. My parents desired that I should become a printer, and accordingly, at the age of thirteen, they apprenticed me to learn that trade. But I always had a great dislike to the occupation, having an instinctive repugnance to soiling my fingers. I only remained seven months in that position, for the dream of my life at that time was to go to London. Chancing to know a gentleman who was then a solicitor on Parliament Street, I wrote to him, begging him to find some position for me in the capital. He interested himself in me, and induced the dry goods firm of Swan & Edgar to give me a post in their establishment, where I remained for seven years. I was always treated with great kindness and consideration by the heads of the house. But my position was not one in which I was able to gratify my natural tastes and aspirations. I was kept at desk work, and was sent to match samples of goods, or to make payments, or to deposit money in banks. My great delight was in inspecting the cases of dresses, cloaks and bonnets that were sent over from Paris as models, and I used to give hints about trimmings and alterations, etc., which were found to be valuable, and so my taste and opinions came to be frequently consulted. I was wont in those days to talk a great deal to the buyers, who were sent from London to Paris, about matters and things in the latter city. A visit to Paris was then no small undertaking. The actual journey took two days and a half each way, so that the buyers from the house of Swan & Edgar used to consume from sixteen to seventeen days for each visit. Finally, Paris became the goal of my aspirations, as London had formerly been. I used to spend my evenings in the study of French, and whenever any French customers visited the shop, I invariably sought them out and tried my best to talk with them. One of my customers went into business at Caen, and I was in hopes that he would take me into partnership; but, on being disappointed in that quarter, I resolved upon going to Paris and trying my fortune there at all hazards. I had no idea of where I should go or what I should do when I got there. But I was so fortunate as to secure a position almost immediately in the house of Messrs. Gagelin & Co., in the Rue Richelieu, then one of the most extensive and best known establishments of its kind in Paris. I arrived there in the year 1846. Two years later came the revolution which overturned the throne of Louis Philippe, and affairs went very ill till after the establishment of the empire. But by that time I had made my way in the house, and had been appointed director of the cloak department, being shortly after taken into partnership. At that time the Maison Gagelin did not make dresses, it being considered derogatory to the dignity of the house to do so. The few, therefore, that I supplied were made outside under my supervision, by a dressmaker in my own employ. In fact, my actions were subjected to so many restrictions, and such vehement objections were made to all my efforts to extend the business, that I finally quitted the firm and went into business for myself. This was in

the year 1858. My partner was a Swedish gentleman, M. Bobergh, and the firm continued to be Worth & Bobergh, till the fatal year of the Franco-German war, which saw inaugurated my house as Worth alone. Before I left the Maison Gagelin, the firm counted many clients at the imperial court, although the house was looked upon as decidedly Legitimist in character, as it dated from the days of Marie Antoinette, and had hanging on the walls of its chief reception room a drawing in India ink of that queen coming to shop there soon after the accession of Louis XVI. It was extensively patronized by the ladies of the Faubourg St. Germain, and one of them introduced me to the Countess Pourtalés, through whose influence I first submitted one of my creations to the empress. It was a walking dress in grey taffetas trimmed with black velvet ribbons, the skirt and jacket made to match, which was then an entirely new idea, though the style has since become so universal. The empress admired it extremely. "But, M. Worth," she said, "I should not like to be seen in public in so novel a costume. I must wait till some one else has appeared in it; for in my position I ought not to attempt to set the fashion. I must be content with following it." So the Countess de Pourtalés took the dress, and six months later I made one precisely like it for the empress, which she wore at the Vincennes races. She was then in slight mourning for her sister, the Duchess d'Albe, and I furnished her at the same time with a house dress in black moire antique, cut princess, that is to say, with skirt and corsage in one piece, the first dress ever made in that style. This was the first order for my imperial customer that I ever filled. Before this epoch I had taken medals at the International Exhibitions of London, in 1852, and of Paris, in 1855. This was whilst I was still in the Maison Gagelin. My exhibit at the first Paris Exhibition was a court train in white moire antique, the ground almost entirely disappearing under embroidery in gold thread and pearls, the pattern of which was my own designing. It represented a series of graduated flounces in gold lace, spreading out in the form of a fan, and even at that epoch of low prices, when \$100 was considered an extravagant amount for a lady to pay for a magnificent dress, was valued at \$6,000. After the close of the exhibition, I took the mantle to the Tuileries to display it, by permission, to the emperor, as there was then talk of its being purchased by the State to be deposited in the Conservatoire des Arts-et-Metiers. The emperor greatly admired it; but, whilst he was examining it, M. Bacchiocchi, then one of the imperial chamberlains, who was present, exclaimed: "There has been a *fleur-de-lys* introduced into the pattern of the embroidery." This remark was not altogether correct, as the figure was not really a *fleur-de-lys*; but as the style of the work was that of the Renaissance, some of the interwoven lines of the design might have assumed a form not unlike that of the obnoxious emblem of the Bourbon dynasty. At all events that speech put a stop to any project the emperor might have formed of purchasing the mantle, and it was consequently left on my hands. Two things at the beginning of the empire combined to give to feminine dress an added importance. One was the invention of the crinoline and the other was the rage for fancy costume balls. The first one of these entertainments took place at the house of Mme. Tascher de la Pagerie, one of the relatives of the emperor, and was a comparatively small affair of an intimate and private character. The empress appeared at it in her first fancy costume, which was furnished by me, and which was a dress in black tulle and marabout feathers, representing Night. She gave her own first fancy ball at the Hotel d'Albe, then on the Champs Elysées, but long since torn down. For this entertainment I made her an elegant costume, in which she was to have personated Diana. The quiver was in silver, and the empress had caused a portion of the diamonds of the crown to be mounted as a long garland of oak leaves and acorns, which she was to have worn fastened transversely across the corsage. This garland was disposed of last year at the sale of the

crown jewels. But the mysterious death of a young relative of the imperial family, who was shot by some person or persons unknown, prevented her from appearing at the ball except incognita and shrouded in a plain domino. I supplied the empress with several other fancy costumes. One was that of Juno, and another the splendid dress of a dogaresa, or wife of the doge of Venice. For this last-named toilet she caused to be fashioned the necklace in diamond network, with a great imitation pear-shaped pearl suspended in each interstice of the network, which was sold amongst the crown jewels, and the fact of the pearls not being real created a good deal of talk at the time of the sale. She never wore this authentic and picturesque, but cumbersome, ornament. She tried it on several times, but it always marred the effect of her costume. It was sold for \$4,000, a price far beyond its intrinsic value. I last saw the empress on the occasion of her brief visit to Paris a few weeks ago. She has almost entirely regained her health under the treatment of the famous physician of Amsterdam whom she consults annually, and with her health she has regained a great portion of her beauty. Her complexion has naturally lost its freshness, but the grace of her carriage, the fine outlines of her features, and the beautiful mold of her bust and shoulders are as striking as ever. I have dressed many lovely women, but never a lovelier one than the ex-empress of the French. Once I made a dress in whose construction one hundred yards of silk were employed. It was in light glacé taffetas in three shades of purple, from delicate lilac to deep violet. The whole skirt was covered with close full ruchings in the three shades, and when completed the dress looked like a huge bouquet of violets. It has occasionally been stated in the newspapers that I have given up all active participation in my business, only remaining an hour or two daily at the establishment in the Rue de la Paix. That statement is incorrect. I arrive there early in the morning and never go home till six or seven o'clock in the evening. And every toilet furnished by the house receives my personal supervision, from the fashioning of the model to the placing of the final trimming.

CHARLES FREDERICK WORTH.

Fainting.

SOME SUGGESTIONS FOR THE TREATMENT OF THE SUFFERER.

Women faint much more frequently than men do, and young women than older ones. Yet old women do faint, and a fainting fit is more dangerous with them than with the others; and even strong men now and then succumb to the same weakness. Of course where there is disease of the heart, occasioning the phenomena of fainting, it has no respect of age or sex or person. In cases of what is known as fatty degeneration of the heart, or as a result of profuse hemorrhage, fainting becomes invested with great danger, and the event may even be fatal, the subject never coming out of the state of syncope. But in most instances fainting is a merely functional affair, implying nothing serious beyond the moment; in fact being more of a relief than otherwise, and more injurious—by means of the fright it gives them—to others than it is to the patient. The act of fainting may be said to be usually of nervous origin—horror, fear, joy, the sight of blood or of anything revolting, the receipt of nauseating odors, experience of foul air, or sudden shocks, all serving to produce loss of sensibility; or it may be occasioned by trouble of the stomach, by extremes of heat or cold, and by long and excessive pain. Of course there are various degrees of fainting, some people merely seeing the world turn black and vanish while retaining consciousness, and others losing themselves completely, and being to all visible intent and purpose as dead as they ever will be. In some the heart will beat, perceptibly, if slightly, and the breath will be present flutteringly; in others there

will be no pulse to be found, and no breath to be detected; and while with some the affair may be of moments, in others it may be of hours; usually, however, moments determine it. In all cases the face is pinched and pale; the heart refusing blood both to the brain and to the surface of the body leaves the system without consciousness, the countenance bloodless, and the skin cold. The remedies should be immediate, although under favorable circumstances nature herself assumes remedial duty. The patient should at once be laid flat upon the back, the head lower than the rest of the body, in order to restore the circulation by gravity; indeed many of those subject to fainting, upon feeling the first symptoms, allow themselves to sink into that position; for if they do not they have learned that nature will usually throw them into it unasked, and perhaps hurt them in doing so, unless she be barred by a straight-backed seat out of which sliding is impossible, or by a bracing and upholding crowd. The next thing to be done is to loosen all the clothes, so that the heart and the lungs may have free play. Following this, plenty of fresh air should be allowed the patient, and a counter-shock should be administered in the shape of a dash of cold water and the vapor of some pungent salt. These simple measures will generally give complete resuscitation, but if they do not, there should be no time lost in bringing a physician to the rescue. Young and sentimental girls often have an idea that there is something peculiarly romantic and attractive attaching to them when fainting. Never was there a greater mistake. Could they once see themselves, pallid and pinched and gasping, they would never wish any one for whose admiration they cared to have that same privilege. A susceptibility to fainting can be encouraged, like one to hysteria; but lovers who have any common sense will not allow themselves to be seriously bewitched by any one liable to such troublesome and unpleasant contingencies as either, health, being of all things, that most to be desired about them by those who wish to lead a pleasant life or to develop their powers.—*Harpers' Bazar*.

MILES OF WINES.

DISPOSITION OF LIQUORS IN THE VAULTS OF THE LONDON DOCKS.

The total floor area of the vaults of the London docks is a million superficial feet, and in this space 83,000 pipes of wine can easily be stored, and then room found for 75,000 casks of brandy. The various vaults are built in the form of a crypt. The largest of these, the east vault, covers four acres of ground, and as we take our light, a small oil lamp fixed to the end of a piece of wood some eighteen inches long, our guide informs us that there are in this cellar alone twenty-one miles of scantling wire, or miniature railway lines, over which the barrels are rolled. The roof, for yards and yards, is covered with a beautiful species of fungus, the growth of which is due to the fumes of the wine, a peculiarity which is all the more noticeable, as where no barrels find a temporary resting place, no fungus grows aloft. It is as light as feathers, and takes the most elaborate and artistic forms. Small hillocks, gigantic bunches of grapes, long ropes which a puff of the breath will snap in two, while such delicate designs are to be found here as to make the lover of lace envy the patterns. In the midst of all this, mushrooms grow, and in the season a good crop is always secured. The "drawing room" covers nearly an acre. This is a private vault, scrupulously clean, the sawdust carpet unspotted. It is rented from the company by a well known firm of wine merchants, and as we examine a cask called "The Duke," we learn how testing is managed. The bung of a barrel is never removed for testing purposes, but the attendant has to bore a small hole in the cask, and the wine flows into the "dock" glass. The taster having satisfied himself as to strength, the flow is stopped by the insertion of a small stick of wood. Every hole has to

be accounted for, and the total must correspond with number of "testing orders" issued from the owner's office. Sometimes a whole barrel runs away in tasting. The brandy cellar covers about seven acres of ground, and some 21,000 casks are resting there just now; but during the Franco-German war the authorities contrived to provide accommodation for 72,000 casks. All the brandy was driven out of France. Its value was \$15,000,000, and an official, who helped to receive the barrels at the time, has made an interesting calculation that if they had been placed in a line, they would have stretched for thirty-four miles. There are casks of brandy here, profusely decorated with cobwebs, over twenty years old. One of the gangways is nearly a quarter of a mile long, and in the midst of this huge cellar runs the snow tank, into which all the sluice, snow and mud of winter is poured. The "vatting floor," where brandy is improved by mixing one quality with another, contains some of the largest spirit receptacles in the world, gigantic yellow tubs, symmetrically made, on each of which is painted its holding capabilities. Here is one which requires 10,000 gallons of liquor to fill it, another takes 3,000, others 2,440, 1,450, 1,500, and 530, something like a thousand gallons of brandy running through the taps every day. The mixing process has ceased at the moment of our visit, but it is whispered that in another corner of the dock a large quantity of gin is about to be converted into "sweetened." The "sweetening" barrel, holding the modest quantity of 5,070 gallons—into which the gin in its unsweetened state is to be poured—is on one floor. Above it, immediately over its huge mouth, is an opening some yards in length, and four inches deep by nine inches wide, and into this a rivulet of gin is flowing from the interior of five large casks which are emptying themselves into the barrel below. As soon as these are empty, others take their place, and the "vat" filled, the sugar in a liquid state is added, the whole mixed together, and shortly afterward it is bottled, sent abroad and approved of as the choicest "Cream of the Valley." A word about the bottling department. As fast as the wine is put into bottles, it goes out for export, the number of dozens sealed, labeled, capsuled and packed in cases every day being 400. A good packer can case a hundred dozen bottles between 8 and 11 o'clock in the morning. In the cellar below the bottling room—where, by-the-bye, 600 dozen bottles can be placed side by side on the floor—barrels are kept, and although the cellar is lighted with gas, fifty-four lamps are needed for dark days, nine of these being "Davy's." Here in one corner are the wax pans, the merchants not only having to provide their own bottles and labels, but wax in the bargain. It takes five minutes to melt a pan of wax. It is placed in a copper pan, heated over a gas stove, and when melted is placed in a receptacle containing a small spirit lamp, which keeps the wax in a liquid state, and finally the case is locked.

COFFEE IMITATIONS.

SOME TRICKS OF THE TRADE PLAYED BY RUSSIAN MERCHANTS.

It is often said by captious critics that English people do not know how to make coffee, but, according to a recently issued report from the British consul at St. Petersburg, we are not, says the *London News*, only eclipsed by continental rivals in the art of preparing the fragrant drink, but also in the art of adulterating the raw material. Here we are familiar enough, or rather much too familiar, with chicory as a substitute for coffee, and, doubtless, most of us have heard of the inventive American who brought out a machine for compressing chicory into the form of coffee berries. In Russia the wary purchaser has to be on the lookout for other adulterants, such as burnt beans, roasted barley and the like. The British consul tells a story of an Odessa grocer who boldly offered a reward to any one who should discover chicory in the coffee he supplied.

As a matter of fact, a careful analysis did prove that the so-called coffee contained no chicory; but it proved more, namely that all produce of the coffee plant was equally conspicuous by its absence. The stuff was really nothing more nor less than roasted barley. In a similar way, tea, which is usually supposed to be so good in Russia, is very often made the means of fraud. A common trick is to mix the good tea with other leaves which have once been used and then dried, a practice which has obvious advantages to those dealers who would thereby feel themselves at liberty to say that the mixture contains nothing but tea. But the most usual adulterant is the leaves of the common willow herb, which, after drying, strongly resembles the true produce of China and India.

FRENCH FRAUDS.

AUCTION SALES IN PARIS OF SHAM MASTER-PIECES AND BRIC-A-BRAC.

Henri Rochefort, the distinguished French journalist, gives the following account of a species of Parisian roguery, from which American travellers on the Continent will do well to take warning:

The rage for bric-a-brac has somewhat abated since I published my book, the "Little Mysteries of the Hotel des Ventes," which was a first attempt at divulging the tricks and devices of auctioneers and salesmen in their dealings with the public at the well known Parisian auction rooms in the Rue Drouot. The work has gone through several editions and is at present out of print. Every gentleman buyer who strays inside this ugly building should know that, in nine cases out of ten, if he ventures to bid for an article put up for sale, it is the owner of that article who bids against him. There is nothing to distinguish the owner from the rest of those in the crowd. He will take up the article like any one else, look at it attentively, put it down, again ask to see it and scrutinize it as if he had never seen it before in his life. After this sham play, he will risk a good round bid, and follow it up against you through thick and thin, or as long as he thinks he can do so without peril and until a certain sum is attained. He will then stop short, and the article is knocked down to you. If the auctioneer knows the buyer, he merely writes the name of the latter upon a sheet of paper, or upon the catalogue opposite to the lot sold; otherwise the buyer must pay at once for what he has bought and settle the auction fees, which vary from five to thirty per cent. On afternoons of great picture sales in the season—from the close of November until the end of April—the Hotel Drouot is a characteristic sight in Paris. All the great amateurs flock to the place, with the most noted dealers from all parts of the world, the latter having often a kind of ambassadorial quality as the representative of European governments. The sales begin about two o'clock, but from three to four is the best hour. The order marked on the catalogue is not always kept; the different lots are sold as the auctioneer may think expedient; and as from three to four o'clock the rooms are usually at their fullest, the best articles are then put up for sale. It is no uncommon thing to have a single afternoon's sale in one room realize \$200,000, a hugely disproportionate share of which is swallowed up in expenses.

The purchaser of pictures or curiosities at the Hotel Drouot should always have present to his mind the legal maxim, *caveat emptor*, for the most knowing collector may be cajoled by the traps that are laid for him. The fact is that dealers in general are a sorry set of rogues. Their speculations in pictures are just as tricky as speculations in stocks. They get up corners; they run up prices and form rings; they let each other in, and they let the public in with a barefacedness that is simply astounding. It cannot be too widely published, for the benefit of this class, that more than half the pictures and studies signed Fromentin are by Paul Delamain, an artist who studied Algeria before Fromentin, and whose

sketches and studies were bought up at his death and prepared by the dealers. Numbers of pictures signed Jules Dupré are by Victor Dupré, only the dealers have tricked the signature. Of pictures by Diaz there is a well known manufactory in the Rue Bonaparte; and the dealers manipulate largely the signature of Richet, the natural son of Diaz, who has thoroughly caught the trick of his fathers' painting. Vernon, too, who is the real author of some of the master-pieces signed Hobbema, has frequently been tampered with by the dealers; and Longuet has painted scores of works to which the signature of Diaz or of Rousseau has been affixed. Quantities of sketches and studies sold as by Theodore Rousseau are by Kreyder, the flower painter who worked for a long time in Rousseau's studio at Barbizon, and who left a heap of his canvases there when he came back to Paris. At the Rousseau sale, Kreyder was astonished to find his studies sold as those of Rousseau. Kreyder did not protest, for he had nothing to gain, and the blunder amused him. As for Courbets, everybody knows whence many and many a Courbet comes. Towards the close of his life, Courbet, being obliged to produce a great deal, and rapidly, divulged the secret of his palette to some of his pupils. Among the most devoted collaborators was C. Pata, who accompanied him in his exile to La Tour de Peilz, and acquired thoroughly the thick color, the bold stroke and the knife tricks of the master of Ornans. Now, C. Pata is quite a remarkable painter, and, like Trouillebert, he sells his pictures as his own, only the dealers insist in changing the Patas into Courbets. At Rome and Naples the forgers devote themselves especially to counterfeiting work of the living painters, such as Detaille, De Neuville, Meissonier, and also the late De Nittis. For instance, of the picture of the "Place des Pyramides," bought by the French Government for the Luxembourg Museum, there exist to my certain knowledge no fewer than eight forgeries. At Geneva, too, there is a considerable manufactory of false Courbets, Corots, Rousseaus and Daubignys, and I fear that a thorough examination of American picture collections would reveal the sad fact that most of these ingenious counterfeits have found hanging room and honor in "le pays des dollars," the country of dollars.

There is a great passion nowadays for antique articles of furniture, and it has given birth to a world of sham antiquities. An army of handicraftsmen are busily engaged in the manufacture of these wares, which are palmed off on confiding people as being two or three hundred years old, and dated from any desired landmark in history. Old chairs, old tables, old dressers, old bedsteads and old anything, even if made last week, have great value in the eyes of many persons satisfied with antiquity in appearance. Worm-eaten furniture is now one of the rages. This stuff is easily produced with the aid of bird shot, which is fired into it. Old houses torn down furnish worm-eaten timber, which is turned to good account in fabricating old sets of furniture. Old door keys, mediæval bellows, gilt flambeaux in Louis XIV. style, warming-pans and brass fenders of the fourteenth century, candelabra, and even old snuffers, find purchasers as fast as these antique wares can be made by skillful artisans in out-of-the-way rooms of the gay capital. Old coins and Regency clocks are cast by the ton every day in Paris, but they are very scarce and bring fabulous prices. The man who buys for his own use or for his own comfort, had better abstain from articles such as these; but with a little or perhaps a good deal of time and patience he may at the Hotel Drouot be able to get some of the ordinary necessities of life, such as tolerably good furniture, and other things, probably for less money than he would have to pay at a shop. If, however, the legs of his chairs break within the first week, he is absolutely without redress of any sort. And if his purchases—as purchases at auctions so often do—appear very different when the articles have been brought home to what they did when looked at in the excitement of competition, he has only, in Paris as elsewhere, to grin and put up with it.

ADULTERATION IN MICHIGAN.

A LEGISLATIVE MEASURE PREPARED BY THE STATE BOARD OF HEALTH.

The following bill is now under consideration by the Michigan Legislature. It is entitled: "A Bill to prevent the manufacture and sale of adulterated articles of food, and to provide for their inspection."

SECTION 1. *The People of the State of Michigan enact,* That no person shall, within this State, manufacture, offer or expose for sale or sell any article of food which is adulterated within the meaning of this Act.

SEC. 2. The word "food," as used in this Act, shall include milk, tea, coffee, cocoa, chocolate, vinegar and every article used for food by man, and every article used for the flavoring or seasoning of such food. The word "person" as used in this Act shall include companies, corporations, partnerships, firms and associations.

SEC. 3. An article of food shall be deemed to be adulterated within the meaning of this Act:

First—If any substance has been mixed with it so as to reduce or lower or injuriously affect its quality or strength.

Second—If any inferior or cheaper substance has been substituted wholly or in part for the article.

Third—If any valuable constituent of the article has been wholly or in part abstracted from it.

Fourth—If it be an imitation of or sold under the name of another article.

Fifth—If it consists wholly or in part of a diseased, or decomposed, or putrid, or rotten vegetable, animal or other substance whether manufactured or not, or in the case of milk if it is the product of a diseased animal.

Sixth—If it be colored, or coated, or polished, or powdered whereby damage is concealed, or it is made to appear better than it really is, or of greater value.

Seventh—If it contains any added or poisonous ingredients, or ingredient which may render such an article injurious to the health of the person consuming it; provided, that the penalties specified in this Act for the manufacture or sale of adulterated food shall not apply to the manufacture or sale of a mixture or compound recognized as an ordinary article of food which is not injurious to health, and the article is distinctly labeled and sold as a mixture with a label securely attached thereto stating in plainly printed words the component parts of the mixture and the proportions thereof. Any article of food manufactured, sold, or exposed, or offered for sale not distinctly labeled as provided in this Act shall be presumed to be pure, and if found to be adulterated within the meaning of this Act, the penalties herein named are incurred.

SEC. 4. In order to enable any dealers to properly label articles designed to be sold, as to the purity of which they may be in doubt, and purchasers to ascertain if a provision of this Act has been violated, it shall be the duty of the Director of the Laboratory of Hygiene at the State University and the Director of the Chemical Laboratory at the State Agricultural College, to supply to each dealer or purchaser who shall submit for examination or analysis a sufficient quantity of the substance to be tested, a statement of the result of the analysis or examination of such substance, upon receipt of the costs of such analysis or examination.

SEC. 5. A State Food Commission is hereby established, as follows: The Governor, by and with the advice and consent of the Senate, shall appoint three commissioners, at least two of whom shall be chemists, who, with the Secretary hereinafter mentioned shall constitute said commission, and who shall hold their office as follows: One shall be appointed for the term of two years, one for the term of four years, and one for the term of six years, and at each regular session of the Legislature thereafter, one commissioner shall be appointed for the term of six years, and until his successor is appointed and qualified. Any vacancy in said commission may be filled by appointment by the Governor until the

next regular session of the Legislature. Before entering upon the duties of his office each member of the commission and the secretary hereinafter mentioned shall file his oath of office with the Secretary of State.

SEC. 6. At their first meeting, or as soon as a competent and suitable person can be secured, the three commissioners appointed by the Governor shall elect a secretary, who shall, by virtue of such election, become a member and the executive officer of said State Food Commission. Said commissioners may elect one of their own number secretary, in which case the Governor shall appoint another member to complete the full number of said commission.

SEC. 7. Said commission shall meet quarterly at Lansing, and at such other times and places as they may deem expedient. They may choose one of their number to be their President, and a majority shall constitute a quorum for the transaction of business.

SEC. 8. The Secretary shall hold his office so long as he shall faithfully discharge the duties thereof, but may be removed for just cause at a regular meeting of the commission, majority of said commissioners appointed by the Governor voting therefor. He shall keep his office at Lansing in rooms to be provided by the Board of State Auditors, and shall perform the duties prescribed by this Act, or lawfully required by the commission, and shall have the custody of all books, papers, documents, samples and other property required by said commission in the performance of their duties.

SEC. 9. The Secretary shall receive an annual salary, payable monthly, which shall be fixed by said commission, but not to exceed two thousand dollars. The commission shall certify the amount due him, and on presentation of said certificate the Auditor General shall draw his warrant on the State Treasurer for the amount. The commissioners appointed by the Governor shall each receive compensation at the rate of five dollars per day for actual services rendered, and each member of the commission, including the Secretary, shall have his actual and necessary expenses while employed in his official duties, and which salary and expenses shall be stated in account under oath, and when allowed by the Board of State Auditors shall be paid by the State Treasurer on the warrant of the Auditor General.

SEC. 10. Said commission shall be charged with the duty of enforcing the provisions of this act, and shall make all necessary investigations and inquiries in reference to the adulteration of articles of food, and for these purposes may appoint or employ inspectors, analysts and chemists, who shall be subject to their supervision and removal, and whose accounts for services and expenses shall be sworn to by them and certified by said commission, and when allowed by the Board of State Auditors, shall be paid by the State Treasurer upon the warrant of the Auditor General. Said commission may also in their discretion apply to the director of the Laboratory of Hygiene at the State University, or to the director of the Chemical Laboratory at the State Agricultural College, and submit to him samples of articles of food for examination and analysis; and it is hereby made the duty of said directors to make examination and analysis of articles of food so furnished by said commission, and the costs of such examination and analysis shall be stated in account and certified to by the commission, and when allowed by the Board of State Auditors, shall be paid by the State Treasurer upon the warrant of the Auditor General.

SEC. 11. Within thirty days after the appointment of said commissioners and the election of said secretary, the commission shall meet at the State Capitol at Lansing, and adopt such measures as they may deem necessary to facilitate the enforcement of this act, and shall prepare rules and regulations with regard to the proper methods of collecting and examining articles of food. Besides the expenses incurred in the publication of the report hereinafter mentioned, said commission may expend annually an amount not exceeding eight thousand dollars for the purpose of carrying out the provisions of this act, which amount the Auditor General shall appor-

tion, as other State taxes are apportioned, to be raised by State tax in the year 1889 and each year thereafter.

SEC. 12. Every person offering or exposing for sale or delivering to a purchaser any article of food included in the provisions of this act, shall furnish to any analyst or other officer or agent appointed hereunder, who shall apply to him for the purpose, and shall tender to him the value of the same a sample sufficient for the purpose of analysis of such article of food in his possession.

SEC. 13. Before commencing the analysis of any sample, the officer having charge of the same shall reserve a portion, which shall be sealed and properly labeled; and in case of a complaint against any person, the reserved portion of the sample alleged to be adulterated shall upon application be delivered to the defendant or his attorney.

SEC. 14. Whoever hinders or obstructs or in any way interferes with any inspector, analyst or other officer appointed hereunder in the performance of his duty, and whoever violates any of the provisions of this act, shall be punished by a fine not exceeding one hundred dollars or by imprisonment in the county jail not exceeding ninety days, or by both said fine and imprisonment, in the discretion of the court.

SEC. 15. Whoever sells any kind of diseased, corrupted or unwholesome food, knowing it to be such, or sells food which has been adulterated within the meaning of this act, without making the same fully known to the buyer, shall be punished by imprisonment in the county jail not exceeding ninety days, or by fine not exceeding one hundred dollars, or by both said fine and imprisonment, in the discretion of the court.

SEC. 16. Whoever adulterates for the purpose of sale any substance intended for food with any substance injurious to health, or barbers, gives away, sells or has in his possession with intent to sell, any substance intended for food which has been adulterated with any substance injurious to health, shall be punished by imprisonment in the county jail not exceeding ninety days, or by fine not exceeding one hundred dollars, or by both such fine and imprisonment, in the discretion of the court.

SEC. 17. Said commission shall annually make a report to the Governor, giving an itemized account of all money expended in carrying out the provisions of this act, the number of prosecutions under this act and the result of the same, the number and kinds of articles analyzed by them or under their direction, and the result of such analyses, and such further statement of facts as when published will enable the people to guard against the purchase and use of adulterated articles of food. Three thousand copies of said report shall be printed, one hundred and fifty copies of which shall be deposited in the State Library, for use in said library and for exchanges; two hundred copies shall be deposited in the office of the Secretary of State for distribution, and the remaining two thousand six hundred and fifty copies shall be distributed by said commission, in their discretion.

SEC. 18. It is here made the duty of the prosecuting attorneys within this State to appear for the people and to attend to the prosecution of all complaints under this act in their respective counties.

SEC. 19. All fines assessed and collected by prosecutions begun under this act shall be paid, one-half into the State treasury and one-half into the county treasury where the prosecution took place.

NEW TEXTILE.—A new textile has been discovered in Russia, on the borders of the Caspian Sea. The plant is called kanaff by the natives, and attains a height of ten feet. From it a chemist has obtained a textile matter which is soft, elastic and silky, gives a thread which is very tough and can be bleached without injury. The stuffs manufactured out of kanaff can be successfully dyed in every shade of color, and would compete with any of the ordinary furnishing materials now in use. But it is particularly suited for making sacks, tarpaulin, ropes, etc., that this new textile, from its cheapness and its extraordinary resisting power, might defy all competition.

DREAM VAGARIES.

THE EXPLANATIONS OFFERED BY SCIENCE OF SOME CURIOUS PHENOMENA.

From time immemorial dreams have been the wonder-land of waking hours. Hope and fear have wrought them into their own fabric. Superstition has seized upon them and worked up a curious ritual of "dreams that go by contraries," of "dreams of the morning light," of dreams with significances, some of which seem natural enough, while to a few of those apparently most arbitrary science herself has offered a certain amount of explanation. Dreaming is an experience which may be called common to humanity, though it varies so widely in different individuals that in a few exceptional cases it is absolutely unknown. Certainly dreams are often made of materials very inadequate to their finished results. Abercrombie relates that during an alarm of a French invasion in Edinburgh it had been arranged that the first intimation of the enemy's approach was to be the firing of a gun from the castle. A certain gentleman, a zealous volunteer, retired to bed, dreamed that he heard this gun, went out, and witnessed and joined in the proceedings of the troops. At this juncture he was awakened by his wife in a great fright, she having had a similar dream. It was ascertained that the falling of a pair of tongs in an upper chamber was the common origin of the dream in two minds already predisposed to the same line of fancy. Another instance is given of a person sleeping in a room where a flat-iron was allowed to scorch a woolen garment. The sleeper dreamed that the house was burned down, and that she could not escape because all her clothes were destroyed! A gentleman, who, before retiring to sleep, had been reading a book of picturesque travels, dreamed that he was journeying across the Rocky Mountains. He was attacked by two Mexicans, and after a gallant fight was taken prisoner. His captors believed him to be the possessor of secret treasure, and, in order to make him reveal its whereabouts, put him to the torture of stripping his feet and holding them to a fire. Waking with a cry of agony, he discovered that his hot-water bottle had escaped from its flannel swathings, and that the undue heat of his toes had conjured up all the rest of the tragic story! A French physiologist caused many curious experiments to be made on himself during sleep. These experiments took the form of trifling physical sensations, which produced almost invariably a wonderfully exaggerated effect on the sleeping mind. Thus a feather tickling the lips was converted into the horrible punishment of a mask of pitch being applied to the face. A bottle of eau de Cologne held to his nose sent him into a dream of a perfumer's shop in Cairo. A pinch on the neck recalled the days of his boyhood, and the old family physician applying a blister to that region. One authority declares that in a dream he made a voyage to India, spending several days in Calcutta, continued his journey to Egypt, visited the cataracts and pyramids, and held confidential interviews with Mahommed Ali, Cleopatra and Saladin, the whole journey apparently occupying several months, but he had slept only an hour. Scientific writers admit that there is a type of dream in which coming physical disease or disaster is shadowed forth—some bodily sensation, perhaps too slight to be noticed by the subject when awake, yet contriving to impress itself in some symbolic form on the sleeping mind. The more striking instances of this sort may serve to explain how, in some lesser degree, certain symbols are likely to attach themselves to certain painful sensations or conditions, until at last they are finally accepted as mysterious presages of evil. Conrad Gressner, the eminent naturalist, dreamed that he was bitten on the left side by a venomous serpent. In a short time a severe carbuncle appeared on the very spot, terminating his life in the space of three days. Another scientific man, who dreamed of being bitten by a black cat, also suffered in the same way. A learned Jesuit author of many erudite theological works, saw, one

night in his sleep, a man laying his hand upon his chest, who announced to him that he would soon die. He was then in perfect health, but was shortly after carried off by a pulmonary disorder. A lady, who had a dream in which she saw all objects dim and obscured as by a mist, was soon after attacked by a disease of the eye, of which that was a symptom. A dream of a great fire, in which the sleeper himself seemed to be consumed, was followed soon after by an attack of inflammation of the brain. Apoplexy, epilepsy and similar diseases are often preceded by frightful dreams, in which the sleeper feels himself scalped by Indians, thrown over precipices, or torn to pieces by wild beasts. Such

Miserable nights

So full of fearful dreams, of ugly sights!

should be treated as "warnings" in the truest sense of that word—as sent by Nature to foretell impending evils which skill and wisdom may be able to avert.

Thus, if science has dispelled such old wives' fables as that to dream of a marriage signified a death, or to dream of a cat meant to meet a foe, she has certainly added mysteries and terrors of her own to the subject. One learned man has actually tried to systematize those subtle premonitions—to make them more available for use and guidance. In his opinion

"Lively dreams are in general a sign of the excitement of nervous action.

"Soft dreams are a sign of slight irritation of the head; often in nervous fevers announcing the approach of a favorable crisis.

"Frightful dreams are a sign of determination of blood to the head.

"Dreams about blood and red objects are signs of inflammatory conditions.

"Dreams of distorted forms are frequently a sign of obstructions and diseases of the liver.

"Dreams in which the patient imagines torture or injury of any limb indicate disease in that limb.

"Dreams about death often precede apoplexy, which is connected with determination of blood to the head."

An educated and very sensible lady had been through a rather fatiguing social day. On retiring to bed she soon fell asleep, and presently dreamed that an old man clothed in black approached her, holding out an iron crown apparently of enormous weight. As he drew near she recognized the features of her father, who had been dead for many years. He addressed her thus: "My daughter, during my lifetime I was forced to wear this crown. Death relieved me of the burden, but it now descends to you." He placed it on her head and gradually disappeared. Immediately she felt a weight and tightness about her brow. Further, to add to her torture, the rim of the crown was studded on the inside with sharp points, which wounded her forehead so that blood ran down her face. She awoke, agitated and excited, but otherwise quite well, and found she had been asleep little more than half an hour. On falling asleep again the dream was repeated, with the additional circumstance that the apparition of her father now reproached her for her unwillingness to wear the crown. When she awoke again she found she had been asleep for three hours. Again she returned to bed, and the dream was repeated in broad daylight. She now arose and made her toilet. Going over the circumstances of her dream, she recollected having heard her father say that during his youth, spent in a distant land, he had been subject to epileptic convulsions consequent on an accident, and that he had been cured by the operation of trephining. On a sister entering her room she proceeded to narrate the picturesque vision which had, naturally, made such an impression on her memory. While thus engaged she suddenly gave a shriek, became unconscious, and fell upon the floor in true epileptic convulsions, though the attack was but a slight one. A week afterwards the dream was repeated, and was followed by another attack. Under suitable treatment both dream and attack ceased to occur. It is a most

singular fact that under certain combined conditions of fatigue, discomfort and malaria whole bodies of men—such as companies of soldiers—have been seized by the same terrific dream, and have awakened simultaneously shrieking with terror. Such an instance is related by Laurent, when, after a forced march, 800 French soldiers were packed in a ruined Calabrian monastery which could ill accommodate half that number. At midnight frightful cries issued from every corner of the building as frightened men rushed from it, each declaring that it was the abode of the evil one—that they had seen him in the form of a big black dog, who threw himself upon their breasts for an instant and then disappeared. The men were persuaded to return to the same shelter on the next night, their officers promising to keep watch beside them. Shortly after midnight the same scene was re-enacted—the same cries, the same flight, as the soldiers rushed forth in a body to escape the suffocating embrace of the black dog. The wakeful officers had seen nothing.

DOMESTIC DIETETICS.

SPECIALLY PREPARED, FROM PRACTICAL TESTS, FOR THE LADY READERS OF THE "AMERICAN ANALYST."

SEASONABLE FOOD.

March.

MEATS.—Beef, mutton, ham, kidneys, liver, venison, sausage, veal.

GAME AND POULTRY.—Grouse, hare, pigeon, chicken, duck, turkey, goose, snipe.

FISH.—Bass, cod, snipe, eels, carp, catfish, flounder, halibut, herring, lobster, mackerel, mussels, oysters, perch, pike, rock-fish, salmon, smelt, whitefish, trout.

VEGETABLES.—Artichokes, beans, carrots, celery, garlic, lettuce, onions, parsley, parsnips, potatoes, shallots, spinach, turnips, water cress.

FRUIT.—Apples, bananas, oranges.

PRACTICAL RECIPES.

DRIED PEA SOUP.—Let a pint of dried peas soak over night in two quarts of cold water. Put on the fire with one gallon of cold water and one quarter of a pound of bacon or salt pork fried to a light brown. When it boils skim carefully, cover, and let simmer for three or four hours. When the peas are very tender strain them out and mash them through a sieve into the soup again, return to fire, add a teaspoonful of sugar, two quarts of stock, and when it boils a tablespoonful of flour will mixed into a tablespoonful of butter. Season and serve with little dice of toasted bread.

PEA SOUP WITH CREAM.—Use the above recipe, substituting a cupful of sweet cream for the pork or bacon and butter; season with celery. Sweet corn is also nice in pea soup.

TARTARE SAUCE.—Yolks of two eggs, one-half cup olive oil, one saltspoonful salt, one-half saltspoon pepper, one tablespoonful vinegar, one-half teaspoon mustard, one tablespoonful chopped gherkins or capers. Beat the yolks and vinegar together; add to them the salad oil drop by drop. When all is in add other ingredients, and serve with cold fish or meats.

TOMATO TOAST.—Toast thin slices of bread very thoroughly on both sides; butter and lay on a platter. Put a pint of stewed tomatoes through a colander; put them in a stewpan and season. When just ready to serve, add a pinch of soda, and then one-half pint of thick cream; pour over toast and serve at once.

BISQUE ICE CREAM.—To three pints of cream add one-half pound macaroons, dried and pounded to a dust in a mortar; add sugar to taste, and one-half pound of almonds, blanched, washed and chopped. Put in freezer, and when half frozen add two wineglassfuls of sherry; freeze and serve in a mold.

FRICASSEE OF OYSTERS.—One pint oysters, one pint milk, or milk and cream, two tablespoonfuls corn starch, two heaping tablespoonfuls butter, one egg. Scald oysters in their liquor; drain and put over the fire in a stewpan, with one tablespoonful of butter. Let them just begin to curl, when remove from fire. In another pan have the milk cooking; when it is about to boil, add the thickening, with one tablespoonful of butter; when thick, take from the fire and add the oysters. Stir all slowly into the beaten egg; add seasoning to taste. Put on the fire again for three or four minutes, and serve hot.

HOMINY MUFFINS.—One large cupful white flour, two teaspoonfuls salt, and two teaspoonfuls Horsford's baking powder. Mix together while dry. Then add two cupfuls cold boiled hominy, beaten smooth; three eggs, one-half cup melted butter, two tablespoonfuls white sugar, and sweet milk enough to make a thick batter. Bake quickly.

JELLY.—One cupful sugar, one egg, the juice and grated rind of one large lemon, one tablespoonful water, one teaspoonful of flour. Place the dish in boiling water, let it thicken; when cool, spread.

TO USE UP COLD MEAT.—Prepare meat as for hash; make it in rolls (like a sausage) by binding it with raw egg; tie each roll carefully in cabbage leaf, and boil one-half to three-quarters of an hour in weak stock.

SALT WATER IN GAS WELLS.—Salt water is beginning to be a great nuisance to the oil and gas resources of North-western Ohio. It is invading nearly all the wells, and making an immense amount of trouble, some property having been altogether abandoned on account of its presence. Salt water is effecting the gas wells of Findlay to a large extent, more noticeably in the famous "Karg," which at times cannot be used for several days. After a period of rest, however, the disturbing element seemingly disappears, but under high pressure upon the well returns again.

CARE OF UMBRELLAS.—Umbrellas will last much longer if, when they are wet, they are placed handle downward to dry. The moisture falls from the edges of the frame, and the fabric dries uniformly. If stood handle upward, as is commonly the case, the top of the umbrella holds the moisture, owing to the lining underneath the ring; it consequently takes a long time to dry, and injures the silk or other fabric with which it is covered. This is the main cause of the umbrella wearing out so soon at the top. Umbrella cases are responsible for the wear of the silk. The constant friction causes tiny holes that appear so provokingly early. When not in use the umbrella should be let loose, and when wet left loose to dry.

BUILDING FIRES.—When the fire dies out or burns out (it will not do either if one attends to her business) there is a crust on top with either a vacant space or a bulk of ashes and cinders below. In either case do not touch the stove with shaker or poker. Take some thin pieces of pine, long enough for the purpose, thrust a piece here and there through the crust as far as you can, as you would stick pins in a pin cushion. The lower end of the sticks should reach towards the bottom of the ashes. The tops should project a few inches above the crust. Fill the space between the projecting sticks on top of the crust with paper, put a little larger and harder wood on top, light the paper, and when the fire has run down the sticks you can riddle the stove slightly and put on the coal.

AN AIRY FLIGHT.—According to a correspondent of the *Electrical Review*, Mr. Edison believes that the time will come when transportation through the air will be the order of things in that line. The idea that the airship must go up a mile or more is erroneous. If it were no higher than an ordinary building it would suffice. "When the time comes for it to be put in operation," he said, "there will be one drawback to it, and that is the ease which it will afford criminals to make their escape from whatever point their crime was committed. There will be no danger of their being intercepted by wire, as is the case now. It may be that the same science which will give us this sort of navigation will provide something else by which criminals, who make their escape through the air, will be overtaken. But this will take time. In my opinion, when we shall have aerial navigation we shall see more crime."

THE VALUE OF SALADS.

It is an unfortunate fact that the dietary value of salads is but little comprehended by the majority of the American people. Leaving out of consideration those thorough barbarians—sadly numerous, particularly in the rural districts—who look upon "grass-eatin'" with unconcealed contempt, we still have a multitude among us of persons deeming themselves intelligent, who either care nothing for salads, or, at best, look upon them as mere gratifications of the palate, knowing nothing of their importance for the preservation of health. To these it is well to offer the assurance that if they will make a salad of escarole, *barbe de capuchin*, chiccory, dandelion, lettuce, celery, or even of the humble cabbage—better in this way than any other—a portion of their daily dinners, they will soon realize that their digestive and assimilative organs are in better condition than they ever were before. The fresh vegetable material of the salad is in itself highly beneficial, especially in the winter and early spring, when there is a paucity of this element in our ordinary food supply; the oil is a highly valuable ingredient for its effect upon the stomach and bowels; and the garlic—well, some folks do not like garlic, but a right-minded man will want a little flavor of it in his salad, and you can hardly get so little of it in that it will not do you some good, so potent are its virtues. The dandelion salad is worthy of special mention and commendation, from our present point of view, not because it tastes better than either of the others, but for its medicinal effect. It must be a sadly worn-out liver that will not take new lease of vigorous life from a course of dandelion salads in the spring time.

Eminent physicians have affirmed repeatedly that the requirement for their profession would be reduced to a minimum if people would only regulate properly their diet; and some have gone so far as to proclaim that nearly all diseases could be prevented and many of them actually cured by employment of the remedial agencies to be found in food. They are undoubtedly right. Proper feeding is the most important requisite for the preservation of such healthful condition in the organs of digestion and assimilation as will afford pure blood, without which rapid deterioration and disease of the whole animal economy is inevitable. The attainment of that condition is the main end in view in the highest medical science. "An ounce of prevention is better than a pound of cure." That is why, if we have not eaten plenty of salads and otherwise lived exactly as we should through the winter, it becomes so imperatively necessary for us to take an efficacious alterative medicine upon the approach of Spring. Cause and effect, in the preservation of health or inducing of disease, move in a constantly widening circle. If our vital organs are in such torpid and weakened condition that they do not make good blood and cleanse it from the effete matter that has a tendency to constant accumulation in it, through the never ceasing waste of tissue, the consequently impure blood fails to properly nourish the organs and their weakness steadily increases, until they stop working altogether. On the other hand, a little rational care to keep the bowels regular, the kidneys operating freely, and the liver active in the discharge of its functions, results in pure blood, higher vitality, and immunity from disease. That rational care may be applied either through proper food or simple alterative medicines. An important element of the former is that upon which we have insisted—fresh vegetable salads. Of the latter there is nothing better than a thoroughly reliable preparation of sarsaparilla, yellow-dock, podophillin and stillingia, with the addition of the alterative iodides in very small proportions. No person, who is not confident that his vital organs are in the most perfect state of health and his vitality the highest possible, should neglect taking that preparation, in the spring season especially. A number of manufacturers profess to offer it to the public, but we can conscientiously

recommend none but that put up by J. C. Ayer & Co., under the title of "Ayer's Compound Extract of Sarsaparilla." There is no secret about its composition, which is well known to the medical profession and universally approved; the reputation of the firm guarantees such excellence and uniformity in the medicine as to warrant full reliance upon it and the world's experience during more than a quarter of a century has fully demonstrated its value.

"IT LOOKS A LITTLE BETTER."

Only a small minority of the patrons of the "bazaars" are men. A man buys what he wants, no matter what it costs; a woman buys what she does not want, if she thinks it is cheap. That, of course, is a generalization. Exceptional women exist who "buy like men," but the bazaar system has not been invented with a view to securing their patronage. In fact, they are not much wanted in those "comprehensive establishments," for the bazaar-keeper very naturally dreads the influence of their intelligent example on the majority, whom he calculates upon beguiling by his seductive bait of "cheapness." His artful game is the popularization of the hallucination that goods may be bought from him for less than from others, and in many cases even below their actual value. To cultivate this delusion, he has various cunning methods, to which reference has already been made by the AMERICAN ANALYST, such as the selling of limited quantities of articles—with the value of which the public are thoroughly acquainted—at actually less than cost, and the retailing of job, auction and bankrupt lots of goods at preposterously low figures. His "book" department also aids him very materially. Not one in a thousand persons knows the enormous difference between the actual cost and the retail selling price of a bound book. When they see offered on the bazaar counter for thirty cents a book that they are aware the retail bookseller demands \$1 for, they do not know that even at thirty cents the bazaar-keeper is making three or four cents, or perhaps even more, upon each volume. The only fact patent to their comprehension is that the books are astoundingly cheap. How does the bazaar-keeper do it? The hypothesis that he steals his stock hardly seems tenable. The question suggests a fascinating mystery, and to women's minds too often involves the altogether incorrect conclusion that if he can do such an immense business successfully, selling goods of one kind at a sacrifice, he must sell all that he offers on the same generous plan. If the bazaar-keeper is asked for an explanation, he replies: "Ah! you see, we do such an enormous business!"—in which his logic seems to be upon a par with that of the old apple woman who, being asked if "You buy your apples at two for a penny, and sell them at three for a penny, how can you possibly make a living at it?" answered: "Oh! sir, I sell so many of them!"

No dialogue is more frequent among women than one like this:

"You paid fifty cents a yard for it! Do you know that you can get exactly the same thing for forty-seven cents at ———'s bazaar?"

"Are you sure that it is the same?"

"Oh! certainly. I priced it only yesterday. It looks just precisely the same, or perhaps, if anything, a little better."

That "looks a little better" indicates the figurative wood-pile in which the proverbial African is concealed. In plainer phrase, it touches the secret of the cheapness of the bazaar-keeper's goods. He seems to be selling them for just what other retailers have to pay for them to the manufacturers, or perhaps for even a little less. How can he afford to do that, and yet pay rent, gas, interest on investment, employees' wages, the cost of enormous advertising and the manifold other expenses involved in his business? The answer is easy. He sells an article that "looks a little better," but is not the genuine thing. Possibly, if he were a most eccentric sort

of philanthropist, he might consciously go on making women happy by selling them goods for less than their real value, until he went into inevitable bankruptcy; or if he were a fool he might pursue the same course unwittingly. But that he is neither, and that he does not travel toward insolvency from either cause, is sufficiently demonstrated by the wealth that he steadily accumulates. He is doing business to make money. So long as people are to be influenced in their purchasing by making apparent cheapness a primary consideration, he will fool them "to the top of their bent" with marvels of cheapness. If the goods do not wear well, "perhaps," the buyer will console herself by thinking, if she "had taken others at three cents more per yard elsewhere, they might have been no better;" or, "they have been pretty hardly used;" or, she is "tired of them anyway, and wants something new;" and, "at all events, they were so cheap." And she goes back to the bazaar to buy more cheap imitation goods. It need not be considered a discredit to a woman to say that she is unable to detect the difference between genuine and imitation goods, even among textile fabrics, the range of material in which she may naturally be supposed to be best informed. Very often trained experts are in doubt, and can only decide after very delicate and carefully made tests. The skill of the spinner, weaver, dyer, color printer and finisher may "deceive even the very elect," when they combine together to get up an article that, costing less than something else, still "looks a little better." Slight changes in material employed or in its treatment may readily make very considerable reduction in actual cost to the manufacturer, without creating any difference liable to exposure by anything short of the crucial test of "wear and tear," and a little of the saving thus effected may well be expended on giving a superior finish to the exterior of the imitation. This is one of the secrets of the cheapness of bazaar goods, and the extension of its application is almost unlimited. Wide as is the field for deception in dress goods, it is even greater in the made-up articles—for which there are now prominent "departments" in the bazaars—ladies' suits, wraps, cloaks, shoes, etc., where the art of making things look better than they are finds infinite extension beyond the realm of simple fabrics, through the taste, skill and cunning of designers and makers. Take the one article of ladies' gossamer waterproof cloaks, for instance. It is quite true that those which are offered in our bazaars are very much cheaper than good ones could possibly be, and that they even "look a little better" than much superior articles. Prettier things, of their kind, it would hardly be possible to procure; but they do not wear well. Nine-tenths of the waterproof garments sold in our bazaars are quite unfit to wear, and are far from being really cheap at any price. Instead of being made with sewed seams, of properly vulcanized rubber-coated cloth, which has a strong, serviceable textile base beneath a waterproofing that is odorless, unaffected by temperature and capable of shielding the wearer perfectly, season after season, these well-named "gossamer" articles are defective in every requirement except that of "looking well." They are only gummed together at the seams, in most instances; they tear almost as readily as paper would; they become hard in winter and sticky in summer; they make the wearer smell like a box of "gum" shoes, because when not steam vulcanized they decompose, and even when they are new they are by no means impervious to water. It is not by any means pleasant to commend a foreign production as superior to an American article, but it is necessary to do so for the purpose of illustrative contrast in this connection. Every feature that the ideally perfect waterproof garment should present—not one of which distinguishes the American goods spoken of—is possessed by the famous "Mackintosh" goods made in England. Their seams are sewed, as well as cemented; their fabric is very strong, durable and equally soft and pliable under all conditions of heat and cold; they are odorless and their waterproofing is the best vulcanized, instead of being simply brushed or

daubed on as a cold solution, or paste supposably containing rubber, as is the process adopted for the making of the cheap American "gossamer" garments. There can be no question of the ability of American manufacturers to rival in excellence the work of any foreign houses, but unhappily their demonstration of that ability is scant by comparison with the ingenuity they display in meeting the requirement for "cheap" goods, such as the bazaars demand. Their tacit acknowledgment of the superiority of the English goods is seen in their ingenious colorable imitations of the name, which has come to be recognized the world over as a guarantee of standard excellence.

A HANDY CYCLOPEDIA.

The issue of the tenth volume of Alden's *Manifold Cyclopædia* challenges renewed commendation of the convenient shape and comprehensive character of this admirable enterprise. The present volume extends from *Cosmography* to *Debry*, contains about 640 pages and about 100 illustrations, handsomely printed and neatly bound in cloth, all for 50 cents! The *Manifold* is more comprehensive than any other cyclopædia except *Cassell's* (which costs several times as much), including an unabridged dictionary of the English language in addition to ordinary cyclopædia matter, and though many of the articles are necessarily brief, they are sufficiently full for practical people, and some articles are surprisingly extended—for instance, *Cotton* occupies 26 pages; *Creeds and Confessions*, 5 pages; *Cricket*, 4 pages; *Crusades*, 6 pages; *Darwin and Darwinian Theory*, 17 pages, and so on. It would be strange indeed if a cyclopædia of such great merit, published at a cost so surprisingly low, did not reach an enormous circulation. A specimen volume may be ordered and returned if not wanted, John B. Alden, publisher, New York, Chicago, Atlanta and San Francisco.

ANOTHER "ROYAL" LIE.

Advertising largely shows good business enterprise and always pays if the advertisements tell the truth, but when any concern resorts to gross misrepresentations by misquoting official reports, distorting facts, exaggerating the good qualities of its own manufacture and belittling its competitors, the public quickly sees through the scheme and leaves the goods which need such bolstering up severely alone. The *Royal Baking Powder Company* is again at its old tricks. By misquoting the report of the New Jersey State Board of Health, clumsy interpolations and wholesale garbling with quotations from worm-eaten chestnuts prepared in its own office years ago and crediting its own paid for advertisements to supposititious medical journals, it now seeks to make the public believe that there is but one wholesome baking powder made and that is the one that that company makes. We have over and over shown the falsity of these claims. There are some very poor baking powders made in this country, but there are very few which are not at least as good and wholesome as the *Royal Ammonia* filled, and there are many baking powders, cream of tartar as well as phosphate, whose makers do not have to resort to falsehoods to sell their powders which are vastly superior in every way to this *Royal*.

BUSINESS NOTES.

THE BEST.

"Here I am," as an Esterbrook Pen said when a customer asked the stationer for the best pen in his place.

HORSFORD'S ACID PHOSPHATE AS A NERVEINE.

Dr. F. de V. Hoard, Concordia, Kan., says: "I have used it personally, and am greatly pleased with its action as a nerveine."

Use
Without
Soap.

Tablespoonful of Pearlina to Pail of Water

And you have the best and quickest means of washing and cleaning. Directions for easy washing on every package.

Why is Pearlina so largely imitated?

Why do these imitators invariably select names ending in —INE? Why are they compelled to peddle their goods from house to house—use deception, falsehood, offer prizes, claim that their powders are as good as Pearlina, etc., etc.? This is why: PEARLINE is the best—never fails—never varies—has no equal—and is as harmless as the purest imported castile soap. Sold everywhere. Millions now use it.

AMERICAN * ANALYST

WANTED ON LIBERAL TERMS.

A BUSINESS BENEFIT.

ADVANTAGES TO ADVERTISERS OFFERED
BY THE AMERICAN ANALYST.

It has not the limitations of a daily paper. No one
reads yesterday's paper. A monthly lives at least a
month, while a semi-monthly is fresh twice a month,
and its audience is not limited by geographical lines,
but the circulation is all over the United States and
Canada.

It contains matters of interest to everyone, especially
the ladies of the household, and is, therefore, sure of a
careful perusal. Our audiences are intelligent and of
the better classes, who have money to spend, and any
well worded advertisement in our columns, giving real
information, will receive a careful perusal.

Our rates are as low as our circulation affords. Large
circulation and original matter cost money, and those
advertisers who desire to realize these benefits must
expect to pay reasonably for them.

Advertisements in our columns are permanent. Most
of our subscribers bind their numbers.

Our advertisements are set up in an attractive form,
sure to call the attention of the reader.

Anything that our readers want, or for which a de-
mand is to be created, not wholly of a local nature, will
pay to advertise with us.

We take only advertisements from legitimate houses
of really meritorious goods, and give them all the edi-
torial assistance they deserve; consequently our readers
knowing this, have confidence in advertisements con-
tained in our columns.

The fact that we have the best and largest houses in
every branch of trade advertising with us, and that they
always renew as their seasons arrive, proves beyond a
doubt that they have found the AMERICAN ANALYST a
good advertising medium. Why should not you?

GOOD ADVERTISING AGENT WANTED,

Address, ANALYST PUBLISHING CO., 19 Park Place, N. Y.

FOR THE THIRD TIME

in our history we have been forced to move into larger quarters to keep up with the demand from our New York, Worcester, Springfield, Providence, Lynn, New Haven, and two Boston stores, and our enormous mail trade. We now occupy two-thirds of an acre of space devoted entirely to custom-work, turning out more garments than any house in the United States. You can order by mail by our system as safely as if you could call at one of our stores. To obtain the famous Custom-made Plymouth Rock \$3 Pants, first, send 6 cents, for which we will mail you 20 sample self-measurement blanks, and linen tape measure, provided you MENTION THIS PAPER, or if you cannot reach us, tell us about the color preferred, with waist, inside leg, and hip measures, remit \$3, together with 35 cts. to cover cost of expressage or postage, and we will forward the goods prepaid to any address in the U. S., guaranteeing safe delivery and entire satisfaction or money refunded. Remember, also, that we make to your order, Full Suits, \$13.25, Overcoats, \$12.00, and that for any cause we refund money at buyer's request upon return of goods, or make alterations or new garments free of extra charge.

PLYMOUTH ROCK PANTS CO.

Address all mail to 11 to 17 Eliot St., or 18 Summer St., Boston, Mass.

BRANCH OFFICES.—285 Broadway, New York; Burnside Building, Worcester, Mass.; Gilmore House, Springfield, Mass.; 60 Market St., Lynn, Mass.; Butler's Exchange, Providence, R. I.; Register Building, New Haven, Conn.

Any one wishing to learn of our responsibility, may write the American Express Co., at Boston, (capital \$20,000,000) or consult the commercial agencies.

MALTINE

MALTINE is far superior in nutritive and diastatic value to any Malt Extract manufactured in the World. There is no constructive that excels Maltine in Phthisis and many wasting Diseases.

MALTINE in its different forms is the only malt preparation we now employ, being so palatable, digestible, and easily assimilated. Of its efficiency in appropriate cases there is no more doubt in our minds than there is of the curative power of Quinine, Cod Liver Oil, the Bromides, and the Iodides.

It deserves to stand in the front rank of constructives, and the constructives by their preventive, corrective, and curative power are probably the most widely useful therapeutic agents that we possess.

PROF. L. P. YANDELL.

MALTINE is a valuable food, a food of priceless value at times of emergency. In fact, in very grave gastric cases it is a food which may be often resorted to when at one's wits end what to do.

J. MILNER FOTHERGILL.

Out of 14 trade samples of Malt Extract examined by Messrs. Dunstan & Dimmock, ONLY THREE possessed the power of acting on starch. These brands were MALTINE, Corbyn, Stacey & Co.'s Extract, and Keppeler's Malt Extract. WILLIAM ROBERTS, M.D., F.R.S.

I have subjected "Maltine" and all other leading "Extracts of Malt" to an exact quantitative comparison of their diastatic activity. The results demonstrate conclusively the far greater diastatic value of Maltine, and enable me to state, without any qualification whatever, that it far exceeds in diastatic power any of the six preparations of Malt which I have examined.

R. H. CRITTENDEN.

Professor of Physiological Chemistry in Yale College.

At the International Health Exhibition held in London, England, the only gold medal and the highest award of merit were given to Maltine by a Jury composed of the best chemists in Europe, and recent analyses made by the most reliable authorities in Europe and America prove conclusively that Maltine—in nutritive and diastatic value—is superior to all other malt preparations now in the market.

NOTE.—Physicians will observe that Maltine, as now prepared, is not so viscid as formerly made, being of a more fluid consistency; and, while retaining the nutritive and diastatic value which has given it precedence over all other Extracts of Malt, it is rendered entirely agreeable to the taste of the most fastidious, and is more easily administered. As now prepared, we positively guarantee that Maltine will not ferment or congeal in any climate or at any season of the year.

COMPLETE LIST OF MALTINE PREPARATIONS.

MALTINE (Plain).	MALTINE with Phosphates, Iron Quinine, and Strychnia.
MALTINE with Alternatives.	MALTINE Ferrated.
MALTINE with Cod Liver Oil.	MALTO-YERBINE.
MALTINE with Hypophosphites.	MALTO-YIBURNIN.
MALTINE with Peptones.	MALTINE with Cascara-Sagrada.
MALTINE with Pepsin and Pancreatine.	

Physicians may obtain Maltine from all druggists in every part of the world. In cases where the physician intends to prescribe Maltine, the word "Maltine" should be written, and not simply the words "Malt Extract," or "Extract of Malt."

Send for Pamphlet giving comparative analyses by 100 of the best Analytical Chemists in this country and Europe.

We will be happy to supply any regular practitioner with eight ounces each of any three Maltine compounds that may be selected from our list, providing he will agree to pay express charges on same.

 North Moore Street, New York.

COLDEN'S
 ORIGINAL LABEL:
 "Colden's Liebig's Liquid Extract of
 Beef and Tonic Invigorator."
LIQUID
BEEF TONIC.

AN INVALUABLE AID IN THE TREATMENT OF
 ALL CASES OF DEBILITY.

Established 15 Years. Endorsed by Scores of Physicians.
 Essentially Different from all other Beef Tonics.
 Beware of Imitations.

COLDEN'S LIQUID BEEF TONIC consists of the Extract of Beef (by Baron Liebig's process), spirit rendered non-injurious to the most delicate stomach by extraction of Fusel oil, soluble Citrate of Iron, 'inchona, Gentian and simple aromatics. An official analysis of this preparation by the eminent chemist ARTHUR HILL HASSALL, M. D. F. R. S., and an endorsement by SIR ERASMUS WILSON, F. R. S., is printed on the label of each bottle.

Its Range of Action Embraces all Cases of Debility.

By the urgent request of several eminent members of the medical profession, I have added to each wineglassful of this preparation two grains of SOLUBLE CITRATE OF IRON, and which is designated on the label as "No. 1," while the same preparation, without Iron, is designated on the label as "No 2." It acts directly on the sentient gastric nerves, stimulating the follicles to secretion and gives to weakened individuals that first pre-requisite to an improvement, an appetite.

I will, upon application, send a sample bottle of Colden's Liquid Beef Tonic to any physician in regular standing. Please ask your Dispensing Druggist (if he has not already applied) to order it. In prescribing this preparation physicians would be particular to mention "COLDEN'S" viz: "EXT. AKNIS. FL. COMP. (COLDEN). It is put up in pint bottles and can be had of Wholesale and Retail Druggists generally throughout the United States.

A BUTTER SCHEME.

The Dairy Commissioners of this State modestly request the appropriation of \$100,000 for the maintenance of themselves and the dairy laws during the coming year. They state as their chief argument that the dairy interests have been benefitted by "not less than \$3,000,000 annually." We heartily indorse the opinion of the *Bulletin* that such an unselfish request ought not to pass unnoticed. Without doubt, however, the selfish butter consumer, who unknowingly contributes his share to the \$3,000,000 additional put into dairymen's pockets, will, in his usual parsimonious spirit, think the dairy trade could better pay this \$100,000 protection (persecution) fund than himself. He cannot see why, if an appropriation of half what is now asked for will yield \$3,000,000, the dairy trade itself should not contribute the whole amount, considering they get all the "benefit" at his expense. He is apt to think the Dairy Commission's friends have made a rather awkward argument against their cause, instead of in favor of it. Why the poor butter consumer should pay a tax to put up the price upon himself is hard to understand, unless that he is made to be humbugged—if not by oleo, then by butter.

A VOICE FROM THE INTERIOR.

The *American Analyst* professes to have discovered warm admirers of Western dressed beef among the hotel-keepers of New York. That paper should be given a leather medal for its discovery. The keepers of hotels who would not praise an article that added to their profits, even though the article were of an inferior quality, are very rare birds. A number of restaurant keepers were recently arrested and fined for giving their customers oleomargarine in lieu of genuine butter. We suppose there would be no difficulty in securing from these convicted frauds an indorsement of the tabooed oleo. But that indorsement would not demonstrate its qualities and worth, nor does the alleged preference for Western dressed beef on the part of certain hotel-keepers prove that it is superior to home dressed beef or that it is equal to it. The testimony must have been furnished by those who are more interested in securing "cheap" beef than they are in obtaining "good" beef. The Western dressed beef men must be hard up for indorsements or they wouldn't publish such stuff.

The above is from the *Butchers' Record*, a bob veal circular emitted in Allegheny, Pa., and committed to the task of injuring the retail meat business through unconstitutional legislation professedly designed for its protection. It is a fair sample of the argumentative infelicity that characterizes the whole of the class of obstructionists to which the *Record* belongs. In their blind eagerness to denounce an enterprise the success of which has turned them green with envy, they fling their mud broadcast with refreshing indifference as to whom they may bespatter by the way. We would venture the suggestion, however, and we do so merely in the spirit of friendly caution, that attacks like the foregoing upon local interests savor of bad taste, to say nothing of their exceeding poor policy from a business point of view. That the Allegheny restaurant butter is inferior to average oleomargarine is easily credible, for the same relationship between these articles exists in many other places besides that interesting Pittsburgh suburb. But it is open to question whether the managers of these establishments entertain any higher regard for the *Record* for dragging them so ruthlessly into the discussion, in order to give point to an argument of its own, and thereby exposing their secret methods of domestic economy. The suggestion of the "ill bird" and its nest is trite, but in this instance entirely justifiable despite its antiquity. The *Record's* fling at the New York hotel-keepers is another illustration of the fatuousness which the provincial editor displays when he attempts to grapple with themes outside the range of his knowledge or experience. It is amusing to fancy the proprietors of our metropolitan hotels—the Windsor, the Buckingham, the Hoffman House, the Fifth Avenue, or any one of the half a hundred similar establishments which this city possesses—seeking to increase his profits by feeding his guests with inferior material, meat or anything else. The fact is, the Allegheny system, judging from the *Record*, is wholly different from that pursued in enterprising communities. Here the best market products of the whole continent are garnered by our hotel caterers with an emphatic disregard of cost, and nothing short of the very best will attract even their momentary consideration. The last source of profit they

aim at is economy in the conduct of their dining rooms. Those skilled purchasers give the steady preference to Western dressed beef, for the simple reason that their customers know its quality and insist upon having it set before them. And the same thing applies in all Eastern cities. Perhaps, however, our esteemed contemporary knows more than his language implies, and in thus allowing his spleen to override his judgment, has acted only in obedience to his employers' instructions. For what the fraternity he represents is seeking to accomplish in several States is to "corner" the local markets for their own benefit, or, as the *Chicago Commercial Bulletin* puts it, to organize "State trusts for increasing the prices of meat." The scheme, however, will not work. It has already become manifest that the public will not stand it. We waive our claim to the leather medal. Let it be awarded to the Allegheny *Record*, which has fairly earned it, and we presume the good people of that town will heartily endorse our suggestion to bestow the decoration where it so appropriately belongs.

FRENCH SAFEGUARDS FOR FOOD.

The French Government laws regarding coloring matters employed in food products, and the papers and wrappers with which they are covered, expressly forbid the use of all copper, lead, baryta, arsenic and mercury colors. All fuchsine, aniline, nitrous matter, such as naphthaline and Victoria yellow; also tropeoline, xyldine red, Cassel yellow, Turner's yellow, Paris yellow, Naples yellow, Cologne yellow, Scheele's green, Schweinfurt green, vermillion and Lyons blue. The same laws also prohibit the use of tin cans soldered on the inside, or any cans made of anything but tinned iron. The use of copper vessels or any copper salts in the preserving of food products is also prohibited.

COMFORT AND HEALTH IN THE CAN.

A price list issued by a large grocery house, and now lying before us, shows an aggregate of nearly 350 different canned fish, meats, vegetables and fruits. These supplies come from almost every part of the United States and the West Indies. They are put up in the best and freshest condition at the place of production, in seasons of plenty; and consequently furnish a fresher and more wholesome article of food than similar but uncanned products after having been carried for miles and exposed for hours in shops or perambulating peddler's wagons. The price also is such that what were once luxuries only attainable by the rich and extravagant are now within the reach of the poorest. Go where you will from one end of the world to the other, the empty cans on every rubbish heap corroborate this statement. Indeed, these empty cans have become so plentiful that a large and profitable business has been done in gathering them, washing off the labels for the pulp, melting the tinning and solder for solder, and rolling the sheet iron for trunk corners, ferrules and sash weights. A decidedly beneficial effect on human health

30 Shaves

for 2 Cents.

Send a two cent stamp to Colgate & Co. 55 John St., New York, who will mail you a sample of this superior soap sufficient to last a month,

and the duration of life has also been caused by the greater variety in diet offered by this extensive canning in the advantages thus offered over the old monotonous winter diet of salt fish, pork and potatoes, hog and hominy, or the hard tack and salt junk of the seaman. No real injury has ever been done by canned goods. In the few instances where we have heard of alleged canned goods poisoning, it was always found to be due to the ignorance of the consumer in assuming that because foods were canned they were exempt from decomposition.

A WEAK MISSTATEMENT.

The young man of the *World*, or as the *Butchers' Advocate* flatteringly calls it, "the great New York *World*," has again opened his mouth, and, as usual, when that youth speaks of anything but base ball or a prize fight, has put his foot in it. In speaking of Senator Cantor's bill to prohibit the sale of Western dressed beef in this city, which is really the object of the bill, concealed under the flimsy disguise of sanitary protection, attention is called, in the usual communist style, to the monopolists and cornerers of the poor man's food as opposed to the bill. Then the rest of the article is devoted to a series of the most barefaced lies that have ever disgraced the columns of a metropolitan newspaper. These gross misrepresentations are too preposterous to deserve even a serious answer. The *World*, which claims to be a well-informed and fairly conducted newspaper, states editorially that in Chicago cattle are killed as soon as they arrive, without rest or inspection, while in New York cattle are subject to inspection both before and after killing. It further claims that all Chicago meat is frozen. These assertions, compared with the inconsistency of the *World's* title of the bill with its real title, are sufficient to show the actual purpose of the young man. Better arguments than these will be necessary to bamboozle the people or to prove the *World's* title to the claim of being the people's paper.

RECOGNIZING THE TRUTH.

It is only natural that when the cattle-raising community of the West bring their reasoning faculties to bear upon the efforts of the Eastern butchers to monopolize the beef markets of the country, they should have their eyes opened to the character of the trick of which they are the intended victims. The truth of this is clearly shown in the editorial which we quote below from the *Stock Growers' Journal*, of Miles City, Montana, the old established and leading organ of the extensive cattle interests of Eastern Montana, extending north and south from the British possessions to Wyoming, and east and west from the Rocky Mountains to the

Dakota line. The *Journal* has hitherto been inclined to side with the obstructionists, but it discovers that it has been toying with a boomerang. The following article appeared in its issue of March 23:

"The inspection bills have not passed more than one or two legislatures of the States and Territories. The commonwealth's attorney of New Mexico has advised the beef inspector of Santa Fe County that the new law is unconstitutional. While our Montana beef leads the world, we have not the grounds of complaint which may obtain with the producers of the Southwest, but we have considered the matter seriously and we fail to see how the inspection laws will aid the producers in the States, even if they should destroy the Big Four, which we may assume as detrimental to their interests. If all the States should require that all beef and pork sold within a State shall be inspected alive, then it follows that all dressed beef and pork must be sold where it is killed. And the products of the Great Falls dressed beef company in this territory cannot be sold outside of Montana, and dressed beef and similar industries except on a picayune scale are killed. The inspection laws are a sort of boomerang which hit the flinger. If the Big Four or any other combination plot to destroy, and succeed in destroying, the business of others by any other than lawful and legitimate measures, then the remedy is the criminal law. It is claimed, and perhaps correctly, that the Armour & Co. people do conspire to unlawfully fix prices of food; if so, the remedy is in the criminal law."

A LARGE INDUSTRY.

The State of Maryland leads all the rest in canning fruits, vegetables and oysters. It is estimated that one-fifth of the people in the State are interested directly or indirectly in the canned goods business. There are 488 canning houses, employing 25,000 hands, who receive \$10,500,000 annually in wages. There are 1,500 additional men employed as can makers. Baltimore has several immense establishments which can fruits in summer and oysters in winter.

ADULTERATION IN NEW JERSEY.

THE IMPORTANCE OF INTERESTING THE PUBLIC IN THE MATTER OF PURE FOOD.

Dr. W. K. Newton, the Dairy Commissioner for New Jersey, in a recent address gave some valuable information on the subject of adulteration of foods in New Jersey, so far as these came within his official observation. He said among other things: "All of the articles examined were bought at retail at the usual place of business throughout the State, and the results obtained represents faithfully the condition of the food supplied to the consumer in this State. From this showing it does seem necessary that the public should be protected in some way from the frauds practiced by these food adulterators, and it is possible for every dealer in food supplies in this State to purchase absolutely pure articles, and build up a trade in that line. It seems to me that one of the best cards that the Grocers' Association could play to catch the trade of the community is to indorse the efforts made to insure the purity of the food supplied, and also to insure the customer against adulterations by showing that they deal in nothing but absolutely pure articles. We examined the much discussed article of American canned goods, tomatoes, corn, etc. We found out that out of fifty-five different sorts of canned goods that we examined, fifty-four were absolutely pure, did not contain any lead or other poisonous ingredient, and only one could be looked upon as suspicious, and that was a can of asparagus which contained tin, undoubtedly from the can. We examined other samples, and found that canned asparagus very often contains large quantities of tin; this may be due to the method of canning or to a peculiar acid in the asparagus; but as a rule American canned goods are perfectly reliable. Of imported canned goods only sixteen were examined, and they were standard brands; five of them pure, and all of them contained copper in greater or less quantities, this being added purposely to

make the article appear better than it really was, and in the case of peas of a green color. Twenty-four samples of ground coffee were bought, the agent going into the stores asking for ground coffee and paying the regular price; sixteen of these were adulterated and eight were pure. The adulterations are roasted and ground peas, and chicory, which, of course, being largely used by the people themselves, is not always added fraudulently; ground rye and ground wheat. In one case we found cocoanut shell. One sample of coffee was examined which contained no coffee at all. It was burnt molasses and some Indian corn ground. Twenty-eight samples of black pepper were analyzed, twenty-two of which were adulterated and six pure. I will group the other spices together. We examined white pepper, four samples only; mustard, forty-one were examined and forty adulterated; cinnamon, twenty examined and thirteen adulterated; cloves, thirteen examined and ten adulterated; ginger, eleven examined and three adulterated; nutmeg, two examined, both pure. I supposed when I started into the investigation that it was not possible to buy pure spice, but I find there are two or three dealers in New York and two or three in Philadelphia who never put up anything under their own name but pure spices. Of course the prices are two or three cents per pound more than those of adulterated goods, but it is perfectly easy to obtain them, and probably, if the trade advertised a little more, you might have an exclusive trade in perfectly pure articles. Black pepper is adulterated with pepper hulls, though the fashionable ingredient now for adulterating is roasted and ground cocoanut shell. I suppose the grinders found, some years ago, that, instead of allowing the cocoanut men to throw the shells away in the garbage barrels, they could buy them and work them up into pepper, and thus make considerable. The cocoanut shells are ground about as fine as black pepper, and then roasted until they are nearly black pepper. This was developed in the test of black pepper. In some of the samples that we obtained there was no black pepper at all; there were buckwheat hulls and ground cocoanut shells mixed together, with a little cayenne pepper in. White pepper there is very little demand for, and that is practically confined to flavoring an inferior article. The fashionable adulterant in this case is perils seeds—a seed which was used for medicine about 250 years ago. It has been rarely used since, but as some men in New York had a couple of cargoes of it on hand, and did not know what to do with it or how to work it off, they sold it to the spice men. There were forty samples of adulterated mustard, out of forty-one examined, and I might account for that by this fact, there are only one or two brands of mustard sold in the United States that are practically pure. Nearly all the grinders use large quantities of flour that extracts the oil which they sell and coloring matter to bring it up to the color of true cinnamon. Cloves are, as you know, a very expensive article, and the adulteration is very great. The chief adulterations are the same as the others—buckwheat hulls, middlings, etc., and also clove stems. There does not seem any reason why ginger should be adulterated, but, just for the sake of adulteration I suppose, they carry it on. It is a very cheap article, and some I have had prepared in the ground state, bought in the ordinary course of business, I think from a mill in Brooklyn, contained no ginger at all. It was ship biscuit roasted to the proper color, and flavored with a little cayenne pepper. There is very little demand for nutmeg, and we only purchased two samples, which were bought for the purpose of investigation. Molasses is sometimes adulterated with salts of tin. These are added to make the article appear better than it is, but it is going out of practice. The tin is used in one process of manufacture to improve the appearance of the article. Of twelve samples of vinegar examined, eleven were acid vinegars, and did not come up to the standard as required by the law. Of seven samples of pickles bought in stores, two were coppered, and the rest of them were in very good condition.

ENGLISH SERVANTS.

GRADES AND WAGES OF THE DOMESTICS IN A FASHIONABLE HOUSEHOLD.

In England there is as much difference in the rank of the several servants as there is between their different employers. The autocrat of the servants' department, when there is no house steward, is the butler. The rest of the household address him as "Mr.," and he preserves order among the men and exercises authority over all. The housekeeper is the head of the women servants, and she is "Mrs." to the maids under her control. As a rule a dignified woman of a certain (or rather uncertain) age, she takes the onus of the detail work off the mistress' hands, and sees that all orders are carried out. When no housekeeper is kept the cook is the female head of the servants' department, and takes the place of the housekeeper. The servants are divided into two grades, the upper and lower. The upper strata includes the house steward or butler, or both; the housekeeper, or, if none, the cook, and the lady's maids. When a housekeeper is kept the cook generally belongs to the lower level, and is the head of that division. A valet belongs to the upper house. In the lower house, or the House of Commons, as it may be called, are the cooks, housemaids, kitchen maids, footmen, coachman and grooms. The line between the two grades is as strictly drawn as between the lower and upper classes. The upper servants take all their meals, excepting dinner, in a special room, which usually goes by the name of the "steward's room;" the lower servants eat all their meals in the servants' hall, excepting tea, which the maids eat in the "still room." In 99 houses out of 100 all the servants eat their meat for dinner in the servants' hall. The lower servants assemble promptly on the stroke of the clock, and stand at their places at the table. The upper servants meet in the steward's room, the head domestic leads the way, and they troop into the servants' hall. The lower servants remain standing until the upper are seated, when the former sit down themselves. No conversation at all is allowed while the joint is being discussed. When the meat course is finished the whole table rises, the upper servants march out in the strict order of precedence they entered, and adjourn to the steward's room, where they enjoy their pudding and dessert. The lower servants regale themselves on cheese, and both can then talk to their hearts' content. In the steward's room strict precedence is observed. The butler sits at the head of the table, and the housekeeper or cook at the bottom. Visitors' servants take rank according to the rank of their master and mistress. The table of precedence, as laid down by Burke, is more strictly observed downstairs than it is upstairs. The maid of the lady taken into dinner by the master of the house is taken into supper by the butler, the rest following in like order. A visitor's footman consorts with the lower division, but if he is dignified by the name of valet, or is the butler, he is housed in the steward's room and enjoys pudding every day, which the lower set get only twice a week. Upper servants are particular how they address each other, the prefix Miss, Mrs., Mr. being *always de rigueur*. Among the lower servants dignity is not of so much importance as speed, and to save time and prevent mistakes servants are called by their masters' names. "Marlborough, there's your man's bell ringing," would cause a frown to sully the ducal brow if he heard it, but it would be heard only in the sanctity of the servants' domain. The number of servants in an ordinary English country house is very large. At one house especial care was taken to find out how many there were, and one seemed to tumble over them at every step. The following is the list: One butler, one housekeeper, one cook, two lady's maids, two footmen, one head housemaid, two under housemaids, two laundry maids, one still room maid, one kitchen maid and two pages, who acknowledge every one as their master. In the stable were one coachman, one

groom and two strappers. In the garden a head gardener, fourteen men and boys, one gasman, one head gamekeeper, and three under gamekeepers. The house was not a very large one nor the owner a very rich man. The house, including the family (which consisted of the father and mother and two daughters), would hold sixteen people, but as a rule the number they set down to dinner was eight to ten, and to wait on these ten people and administer to their comfort and pleasure it took no less than forty servants. The wages in England are not what they are here. A butler gets £50 a year; a cook, £30 to £40; a lady's maid, £20 to £30; footmen receive £18 to £25; housemaids, £10 to £20; and kitchen maids, £8 to £12. A coachman gets from £30 to £50; grooms, £20 to £30; and strappers, £12 to £20, according to age. A head gardener, from £70 to £150 and house and coals; and undermen from 15s. to £1 a week, and they feed themselves. Head gamekeepers receive about £70 to £100, with a house provided, and under gamekeepers about the same as under gardeners. All house servants, however, in addition to the above scale, get "beer and washing" money. The upper servants get two shillings to three-and-sixpence a week for beer, and from eighteen pence to three shillings for washing money. The lower servants get about half those rates, the lowest being one shilling a week for beer and one shilling for washing. Of course a big estate has a pay roll as long as that of a factory. The head man is the agent, who has the entire control of the property. Next to him is the bailiff, who looks after the home farm and the cattle. The others are undermen of different kinds. A large estate will have half a dozen accountants to keep the books correctly. There will be a head forester and half a dozen men under him, a master sawyer and four or five men to cut posts, make gates, etc. Carpenters and glaziers must be paid to repair damages, and two or three are kept also. Paint has to be renewed every year, and at least three are hard at work all the year round. Woods require proper management, and half a dozen are not too many. A river will take several men to watch that it be not poached, and the home farm must be well looked after, and about two men to every thirty or forty acres are required. Roads have to be repaired, and a head man and half a score of others to break stone, mend and fill holes, clear drains, and do things of a kindred nature, are a necessity. The head gamekeeper on a large estate will want about fifteen men to keep off poachers, and the lodges must have proper people in them. These and numbers more help to drain the pockets of the large landed proprietor.

HEALTH AND ALTITUDE.

THE BENEFIT OF MOUNTAIN AIR TO SEEKERS OF HEALTH.

An important climatic element of any country exists in the character of its surface. Its ability to absorb and retain moisture governs in large share its temperature, and the temperature of the soil in a marked degree governs the temperature of the air. They are usually alike. A loose, porous soil covered by a heavy tree growth furnishes the best surface for equalization of evaporation and uniformity of temperature. The earth's surface is charged with negative and the overlying atmosphere with positive electricity. The latter is much more marked in elevated regions broken in sharp mountain ranges. This produces in regions of considerable elevation, during the heated season, thunder storms of great intensity. A mountain or elevated climate is advantageous to a variety of diseases influenced by a change of circulation. The lessening of the atmospheric pressure causes the diminution of the blood flow in the brain and central organs, and increases it in the cutaneous surfaces. Imperfect nutrition, as exhibited in anæmia, indigestion, loss of appetite, etc., is greatly benefited by the pure, bracing air and exercise. Neuralgia, nervous prostration, loss

of sleep, headache, hypochondria, etc., lessen under the stimulus of a better nerve nutrition. The improved circulation and nutrition of the respiratory organs give relief in most cases of asthma dependent upon changes of the bronchial mucous membrane as well as upon innervation. Bronchial inflammations are usually benefited, and the increased respiratory functions lessens the conditions favoring consumption; and often the disease itself, in its incipency, is arrested. The invalid suffering from extreme weakness induced by any cause had better not attempt a residence in an elevated region unless by advice of a competent physician, for while an elevated climate is stimulating and has a powerful therapeutic action on most functions, it requires a certain integrity and resisting power, which the patient may not possess. Organic diseases of the heart and great vessels are, almost without exception, made worse by the overwork demanded of the circulatory apparatus. Perhaps the most important of all conditions to be considered is that of the mental state of the invalid when directed to any locality for the benefit of his health. They should not only be guarded against extremes of exposure, exercise, care as to diet, etc., but above all be given, as far as possible, a bright, hopeful, happy state of mind. All these prerequisites to improvement are so essential that the invalid does well to place himself under the care of a resident physician. Occupation to direct the attention from self should, as far as possible, be obtained. The sportsman, finds recreative pleasure in the rod and gun, the botanist in the wide diversification of plant life, the geologist and mineralogist in the ever-interesting outcropping minerals about him. "The bliss of a spirit is action," is the unwritten law of life, and he who seeks the renewal of its pulses must come under its universal requirement. To the invalid resting under condemnation from the violation of nature's laws, a wise selection of residence in mountain regions holds out a hope often denied to the dweller in the cities of the plain. Everywhere mountains and streams, cliffs and valleys, gaps and glens, add charm to the scene and inspire delight to the lover of the beautiful and sublime, and while health is borne upon the breeze, beauty and grandeur fill the soul.

HOT CLIMATE.—It was found that the loss by evaporation from a large tank for supplying the city of Nagpur with water was in the hottest season two and a half times as great as the quantity supplied for consumption.

A SANITARY PARADISE.—We are not apt to look to South America for evidence of the greatest progress in science or art, and yet it is said that the sewerage system which is now being conducted in Buenos Ayres is the most perfect in the world. Measures have been taken which will result in putting every house in the city in perfect sanitary condition within three years. Sanitarians will watch the result of this stupendous undertaking with great interest, and will be able to deduce from it many valuable practical lessons.

NOVEL USE FOR THE POTATO.—That there never is any certainty as to what base uses the most treasured of our possessions may be put to at one time or another, has just been freshly demonstrated. *L'Industrie Parisienne* tells us that our old and tried friend, the succulent potato, is being utilized in a very strange manner. Our contemporary states that there is a Parisian laundryman who has entirely discarded the use of soaps, sodas, bleaching-powders, and all other varieties of detergents in the pursuit of his business avocations. He merely uses plenty of water (hard or soft, from well or river) and boiled potatoes! The plan is said to be eminently successful, and without employing any kind of alkali, he is able to "get up" with credit to his establishment, the most soiled of linens, cottons, or woollens. When poor Parmentier introduced the strange American root to his *gourmet* compatriots, he little thought that the delicious and useful tuber would come to be used in Parisian laundries for the cleansing of dirty linen instead of filling hungry stomachs. The information is certainly of a startling nature, but our contemporary, *L'Industrie Parisienne*, is too serious to attempt to mystify its readers, unless, indeed, it has been mystified itself.—*The Caterer*.

COUNTERFEIT PRESENTMENTS.

THE TRUE INWARDNESS OF THE CHEAP PORTRAIT BUSINESS.

The next best thing to the actual presence of those we love is to possess a good likeness of their forms and features, whether it be a costly and artistic oil painting, a photograph, ambrotype, tin-type or even a paper silhouette; if it is the best that can be obtained, we are pleased to have even that memorial. For the gratification of this universal desire, a business has grown up throughout the United States of reproducing pictures, which, while praiseworthy and deserving of every encouragement when conducted honestly and fairly, has, in the hands of a class of expert tricksters, degenerated into a mean and contemptible swindle. It is customary with the AMERICAN ANALYST, when it discovers a fraud designed to victimize the public, to investigate it and spread the result before our readers, that being forewarned they may be forearmed. This picture fraud business may be briefly summarized as follows: Portraits, of course, comprise all reproductions of the human form, in whatever manner made and upon whatever material. A large class are those produced by photography, which means the obtaining of a likeness by the action of light on chemically prepared plates, from which copies are printed on chemically prepared paper. To succeed in getting a good likeness, much, of course, depends upon the artistic taste and the technical skill of the operator. But with this method of obtaining likenesses we have not so much to do as with the different kinds of enlarged portraits, now so common as well as fashionable. The simplest way of enlarging a carte de visite or an imperial is by what is known as the solar print process. In this process a negative is secured on glass, as in the original photographing, and from this negative an enlarged solar print on paper is produced. Photography makes all defects more apparent, similar to the revelations of the microscope, hence it becomes necessary, after the solar print has been made, to finish the portrait and cover its defects. This is accomplished in four ways, by tracing over and embellishing the work with crayon, pastel, water colors or india ink. Crayon and pastel work must be done by hand, but water colors and india ink can be applied with the air brush, which is a process of blowing the colors through a tube worked by a pedal bellows, on the principle of an atomizer. As work of this kind can be done rapidly and evenly, it is very deceptive to the inexperienced on account of its soft and well finished appearance; but in reality it is not lasting. The air brush is also used with the indelible solar process, in which case it is far more expensive, but also more lasting. It is, however, never considered as artistic as hand work is. The solar print process, in combination with other mechanical aids, is also used to a greater or less extent in the preparation of outlines, to be afterwards worked up by hand. It is needless to say that the most valuable as well as the most artistic portraits are those which are produced by free-hand drawing, and here, of course, everything depends upon the skill of the artist. A photographic reprint is always a copy of the original picture, and reproduces the likeness with all its merits as well as its defects. To enhance the former and hide the latter, and yet adhere to the likeness, is what demands artistic skill. In addition to these processes, oil painting on canvas and miniature painting wherein also the outlines can be made by photography, must not be overlooked. As may be readily understood, where there is such a wide latitude between high artistic talent and mere mechanical construction, a door is open for much deception, and of this we will now proceed to speak. The most common form of swindling in this direction is the cheap crayon business. This is generally done by persons having a smattering knowledge of the photograph business, or even no knowledge at all, and by means of catching advertisements, whereby they allure people to their so-called studios. They generally advertise highly

artistic crayons, the price of which is usually only five dollars. The victims, when their attention is once attracted, are shown some specimen copies on exhibition in the studio, and an effort is made to exact a larger price out of them. If this effort does not succeed, the order is taken at five dollars. The carte de visite is printed by the cheapest process, costing about fifty or seventy-five cents, and just touched up enough by some impecunious art student to look like a crayon and strengthen the likeness. Such portraits soon fade and look streaked. This student receives about one dollar for the work, and thus for a very poor and perishable imitation crayon, costing about two dollars and a half, the victim pays five dollars. From this five dollar fraud the price goes up as high as twenty-five dollars, without, however, much, if any, improvement in the work. We do not wish to be understood as including in our warning the indelible solar process, because this is frequently employed by first-class artists. Nevertheless, we advise the reader in every case to obtain a free-hand drawing, if possible. Art students, and sometimes even competent artists, though reluctant to do such slop-work for these crayon canvassers, are in a measure dependent upon the latter, either because they cannot spare the time necessary to wait upon private customers, or they have not their studios so located as to receive visitors, or, not being extensively acquainted, they could not secure subjects for themselves. The most unscrupulous of the crayon peddlers are those who travel about the country. They generally supply themselves with specimens made for them by some qualified art student, and then boldly dub themselves artists, taking orders at as large prices as possible, which they cause to be executed by some of their impecunious dependents. One of their common tricks is to get a good artist to make their samples and perhaps to execute one or two of the first orders they take in a neighborhood, which costs them a little more; but they soon pay themselves for this by having all their other work done by the cheaper workmen. There is not a finer or more artistic and lasting portrait than the crayon, when well done, and any first-class photographer can recommend a customer to a competent artist who will do his work reasonably and, in the end, cheaper than these peddlers. It will certainly be better work.

ADULTERATION IN ENGLAND.

HOW JOHN BULL COLORS HIS SAUCES AND MANUFACTURES HIS FRUITS.

Bottled fruits are at times colored green by the addition of copper in the form of the sulphate ("bluestone"). A knife blade immersed in the juice of the fruit in question will rapidly become coated with a bright deposit of metallic copper. The French have a simple and harmless plan of giving an apparent green color to their preserved fruits and olives. The bottles are made of bright green glass. Sauces, potted meats and fish are constantly adulterated, *i. e.*, colored by means of Armenian bole. This is done partly from custom, but chiefly to conceal the dirty appearance of the pastes and sauces. The British public will have its anchovy sauce red. The uncolored sauce is unsalable, though far superior to the red abomination, the filth being removed from the former, while in the latter it is merely concealed by the Armenian bole. Jams are adulterated by the admixture of inferior fruits. For instance, gooseberries are often added to raspberry jam. Marmalades frequently contain apple pulp, or even turnips. Coloring matter and artificial flavorings are freely used. An ingenious industry goes on largely in London which is wholly unsuspected by the public. Raspberries, oranges and other fruits are purchased by wholesale chemists and the juice extracted. Then the pulp is bought at a low price by the manufacturers of cheap jams for flavoring and placed upon the market as "fine new season jam" or marmalade. Mustard and coffee are, as a rule, preferred by the English consumer in an

adulterated state. Many people object to the color of genuine mustard; and consider that the addition of chicory imparts an agreeable flavor to their coffee. Pepper used to be extensively adulterated. Most people have heard of the American "nutmegs" made of wood," but the artificial peppercorn is a British invention. Whole pepper has now become the fashion, and the artificial peppercorn will doubtless soon come to the front again. Spices sold in a powder form are naturally largely adulterated. The business of the drug-grinder offers large temptations to the adulterator.—*The Saturday Review.*

SLEEPING BY COMPASS.

SHALL WE SLEEP WITH OUR HEADS TO THE EQUATOR OR THE NORTH POLE?

The sleep-with-your-head-to-the-north idea had quite a run a few years ago, and there are still a good many people who, perhaps rather from force of habit than otherwise, range their beds so that they stand in line with the parallels of longitude, and sleep with their "feet to the equator," or as near as they can get to it. It isn't everybody's feet that will reach there. Habits are strong in such a matter. But the "Listener" has just received, by way of a Washington Territory paper, an account of a brand-new theory as to the proper way to sleep. The editor of this Western paper relates that he was greatly troubled with sleeplessness and headache at night. No course of procedure that he could resort to brought him any relief. Finally he bethought himself that it always made him ill, when he travelled on the railroad, if he rode backward, or if he lay in a sleeping car berth with his head to the engine; and that, on the other hand, if he sat facing the engine, or slept in his berth with his feet to the engine, he slept well. The reflection led him to apply his experience to the earth itself, which is a sort of great railroad car, whirling along from west to east at the rate of about a thousand miles an hour. He proceeded to range his bed so that when he lay upon it his head was to the west and his feet to the east, and after that he had no more restlessness or headache, but slept profoundly and sweetly, with his "feet to the engine." He commends his discovery to all sleepless and nervous people, and does not doubt that he has hit upon a bit of knowledge which will prove infinitely valuable to human kind. But what about the people who would just as lief ride backwards on railroad trains, and who sleep better with their heads to the engines of trains and the bows of vessels? This may be an eccentricity, but a friend of the "Listener's" once strongly advised him always to sleep when travelling with his head to the engine or the bow, and gave some very plausible reasons for his philosophy. "The movement of a train," he said, "tends to force your blood in the opposite direction from the way the train is going; that is to say, being liquid and under the influence in some degree of the forces of gravitation and inertia, the blood is not carried forward so fast as the solid parts of the body, and tends to collect in the end which is for the time being toward the rear. Now if your feet are toward the engine, the blood will collect in your head and give you unpleasant dreams and sleeplessness. Have the blood in your feet, on the other hand, and you sleep all the better for having it there." "But," asked the "Listener," "does not your being upon a car constitute, as it were, a new centre of motion, and every part of the body being carried along as fast as every other part, prevent any collecting of the blood in the extremity which is in the 'aft'?" "The fact that you are upon the train," replied the theorist, "does not prevent the force of gravitation from working independently of the train, and the principle of inertia certainly carries the blood toward your head every time the train starts. Try it with a spirit level, and you will see the bubble hug the aftermost end of the tube." Besides these advocates of the feet-to-the-engine theory and the head-to-the-engine

theory, there is still another class who follow the cross-wise theory, who never can sleep well on a steamer unless they get an athwartships berth, and who were full of rejoicing when a sleeping car was made which had berths running crosswise. Between all these conflicting parties the "Listener" cannot undertake to decide, but what he does know to a certainty is that the advocates of each theory sleep best in the position that they believe in, while the great mass of mankind who give no thought whatever to the matter sleep fairly well, on the average, whichever way they are put. All this inclines the "Listener" to believe that it is all a matter of notion, and that sleeplessness and wakefulness are due to quite other causes than the relative position of our bodies as to the poles and the equator or the engines of trains or the bows of ships. He is also much inclined to think that sleeplessness can be prevented, at least up to a certain point, or when there is no actual nervous disorder, by what may be called volitional composure. People who are given to intent thinking, and whose brains are actively at work all day, may think all night, not sleeping at all, if they will. And on the other hand, if their brains and nerves are in good condition, they may cease this active process of thought if they will; and if they do cease it, the chances are they fall asleep. The tumult of thought may return and return, but if upon each return it is composedly and resolutely put aside, the sleep will come.—"Listener," in *Boston Transcript*.

DOMESTIC DIETETICS.

SPECIALLY PREPARED, FROM PRACTICAL TESTS, FOR THE LADY READERS OF THE "AMERICAN ANALYST."

SEASONABLE FOOD.

April.

MEATS.—Beef, lamb, mutton, ham, kidneys, liver, sausage, veal.

GAME AND POULTRY.—Brant pigeon, chicken, duck, turkey, goose, snipe.

FISH.—Anchovy, bass, cod, snipe, eels, carp, catfish, flounder, halibut, herring, lobster, mackerel, mussels, oysters, perch, rock-fish, salmon, smelt, whitefish, trout, sturgeon.

VEGETABLES.—Artichokes, beans, carrots, celery, garlic, lettuce, onions, parsley, parsnips, potatoes, shallots, spinach, turnips, water cress, radish, rhubarb, sea kale.

PRACTICAL RECIPES.

ROAST OYSTERS.—Use large oysters; a few minutes before they are wanted put them on a gridiron over a moderate fire; when done they will open; remove them carefully from the fire so as not to lose the juice. Serve them hot on a napkin.

AFTER-DINNER CROUTONS.—Make a paste of two parts rich creamy cheese, one part butter, a little finely chopped parsley, and a dash of cayenne pepper. Cut bread into slices one-quarter of an inch thick; cut each slice into four small triangles; dry them in the oven slowly until they assume a delicate brownish tint; spread with the paste and serve.

TO BOIL ONIONS.—Peel medium-sized white onions and let them stand in cold water one hour; then put them into boiling water and boil fifteen minutes; pour out this water and put in more boiling water, and cook till soft; then pour off the water and put in a little milk; season with butter and salt, and let them cook in the milk about five minutes; thicken the gravy with a little flour and water. This way of cooking will take away the strong taste of the onions, and make them tender outside as well as inside.

BAKED CREAM FISH.—Trout and whitefish are best for this. For a fish weighing three or four pounds take one pint milk, one onion, one teaspoonful of mace, two

tablespoonfuls of butter, some powdered cracker, and a little of sifted flour; steam the fish; when done pick it up as fine as possible; season with salt and pepper; put it in a baking pan in layers, sprinkling each layer with a little flour; do not use too much flour; boil the onion and mace in the milk, add butter, and have this sauce ready to pour over fish when it is arranged in the dish; sprinkle the fine cracker with some butter over the top, and bake the whole in a slow oven for about an hour.

GENOA CAKE.—Cream a half pound of butter, and mix with it, by degrees, eight ounces of sugar, ten ounces of flour, half pound of Sultana raisins, two ounces of mixed peel, cut up small, and five well-beaten eggs; beat all well together for some minutes; have ready two ounces of almonds and one ounce of pistachio nuts, blanched and cut up; add them to the other ingredients, and, lastly, the grated rind of a lemon and one teaspoonful of baking powder; butter a tin, and line with buttered paper to project about one inch above the rim; pour in the mixture and bake at once in a cool oven for one and a half hours; sprinkle a few cut-up almonds on the top of the cake. If well made, this is a delicious cake.

RICE FRITTERS.—To half a pound of rice put two-thirds of a pint of water, boil it to a jelly; when cold, add to it eight eggs, a pint of cream, a little salt and nutmeg, and quarter of a pound of butter melted; mix well, adding the butter last, and working it only so much as will make the batter sufficiently thick. Fry them in lard, but employ as little as it is possible to fry them with.

CORN BREAD.—One large coffeecupful of dry, finely-bolted corn meal, one tablespoonful white sugar, a little salt, two tablespoonfuls Horsford's baking powder; sift thoroughly, then mix with one and one-half large coffeecupfuls of cold sweet milk or cold water, and add two well-beaten eggs. Bake immediately in a shallow pan, or for gem cakes in a gem pan.

TO PROTECT SILVER.—It is said that collodion dissolved in alcohol and applied with a soft brush will prevent silver from becoming tarnished.

ELECTRICAL HEAT INDICATORS.—Electric heat indicators, consisting of thermometers incased and protected by iron tubes, provided with platinum wires and connected to a system of electric bells and indicators on deck, are the latest invention for detecting spontaneous combustion among ship cargoes. Should any undue heat arise in any part of the cargo, the mercury in the thermometer will rise, make contact with the platinum wire and give an instantaneous alarm on deck, indicating at the same time the exact spot where the heat exists.

ARTIFICIAL LEATHER.—Dr. George Thenius, of Vienna, has a process for the manufacture of artificial leather from red beechwood. The best wood for the purpose is taken from 58 to 60 year old trees, cut in the Spring, which must be worked up immediately, bark peeled off, steamed, treated with chemicals in a kettle under pressure, and exposed to several more operations which the inventor does not mention, as he wants to have them patented. From the prepared wood strong and thin pieces are made by means of heavy pressure. The inventor states that a solid sole leather can be obtained, which he claims is superior to the animal leather in firmness and durability, and can be worked up in the same way as animal leather, nailed and sewed.

PHOTOGRAPHING BULLETS.—The plan of Mach, the Austrian chemist, for photographing bullets by electric light is to illumine the bullet by letting it break an electric current formed, but the velocity of the bullet must exceed that of sound, in order that the conditions of air before and behind the projectile can be shown. After various experiments he succeeded in his efforts to photograph projectiles fired by Wernall and Jurde guns, having respectively an initial velocity of 438 and 530 metres per second. The photographs obtained in this manner showed an air formation in front of the bullet having the form of a hyperbola, while behind it almost a vacuum was formed, in which, when the initial velocity was very great, there were some curious spiral motions. From the description given there appeared from these photographs to be a great similarity between the motion of a body through the water and that of a projectile through the air.

NEW MICROPHONE.—M. P. Colbere, of Berlin, has just patented a microphone which possesses some features of interest. A box moving on a vertical support is almost filled with carbon shaped in the form of a cup, which is filled with mercury. This is covered with a layer of powdered carbon, on which the diaphragm rests. This latter is a very thin carbon plate, the edges of which are fixed between two non-conducting rings. The diaphragm is connected to the negative pole and the powdered carbon to the positive pole of a voltaic cell. The apparatus is said to transmit speech exceedingly well.

MUSIC IN MEDICINE.—From the time when medicinal knowledge was first embodied in rules of practice, and probably from a much earlier period, music held a recognized place in the treatment of disease. In no class of diseases, however, are we likely to derive so much benefit from the use of so pleasant a remedy as in those affecting the mind itself. In melancholia and allied states of depression its value is generally admitted in our own day. Ancient practitioners were also cognizant of its use in this respect. We must have all felt how suitable is its infinite variety and facility of expression to the changing moods of the same, and it is therefore the less difficult to understand how straying minds are pleased and settled by its charm. Certain it is that its beneficial effect is in this case considerable, and our readers, though possibly unable to acquire a knowledge of the art, should at least possess, and if needful assert in practice, a sense of its therapeutic value.

DO YOU CATCH THE IDEA?

AN ADVERTISING TOPICAL SONG.

We present below, with an illustration, a new topical song, which appears in a little pamphlet issued by Herbert Booth King & Bro., 202 Broadway, New York, and which they have copyrighted.

DO YOU CATCH THE IDEA?

You can't push two things in the same way precisely;
One's certain to fail where the other goes nicely;
They want different channels, to put it concisely—
Do you catch the idea?

For, one line of goods may be highly successful,
If advertised well, and another distressful,
Even if with your "ads." you'd filled the whole press
full—
Do you catch the idea?

The wording of "ads." is an absolute science;
When properly done, it bids failure defiance;
And upon their effect you can then place reliance—
Do you catch the idea?

An agent is needed by a large advertiser,
As client has need of a legal adviser,
To counsel and guide and render him wiser—
Do you catch the idea?

But the agent has duties far straighter and plainer,
And, unlike the lawyer, he needs no retainer;
In which his employer, of course, is the gainer—
Do you catch the idea?

The outlay of money he wisely compresses,
As the interest of his employer progresses;
Successes of customers are his successes—
Do you catch the idea?

AMERICAN BEEF TEA.

"PHIL" ARMOUR VS. LIEBIG'S BEEF EXTRACT.

"You know," said the man who sat next to me at lunch to-day, "that Phil Armour went over to Germany last summer."

I said I remembered it.

"Know what he went for?"

I replied that Mr. Armour had informed me on his return that he went over to have a surgical operation performed on one of his heels.

"Yes; I know he says so. You know, if you will think, that a few years ago you couldn't go amiss in a restaurant or hotel or drug store for those signs, 'Liebig's Extract of Beef.' You hardly ever see 'em now, do you?"

I remembered that they were not as numerous as formerly.

"Armour is a long-headed man. He saw that a man in Germany was getting rich on something that ought to belong to this country. He went over there and looked into it. He may have had an operation performed on his heel, but he came back with a formula in his pocket for making beef tea. Everywhere you go you see a little sign hung up, 'Armour's Beef Tea.' I never saw one until since his return from Germany. I'll bet they are in Germany by this time, alongside of Liebig's. Here's to Phil Armour, the Liebig of America."

—Chicago Times.

ADVICE TO A YOUNG WOMAN.

A correspondent asks us to send her a recipe for some lotion that will remove "black-heads" and "pimples" from the skin. She says that she has so many of the former that her face "looks like a stippled engraving," and so many of the latter that it "feels like a nutmeg grater." We really would like to accommodate her with the desired recipe, but, unhappily, there is no such thing. A safe and effective outward treatment for eruptive disorders does not exist. Of the many lotions, washes and pastes prescribed for the removal of skin blemishes, none has the desired effect. The trouble lies much deeper than the surface, and external applications, other than good soap and water to keep the skin clean, are of just about as much value as blacking a shoe

would be to cure bunions on the foot that wears it. But we will tell her how to make her skin smooth as satin, and to give it the glow of health—that beautiful pink-and-white tint that ladies covet and men admire.

Primarily, then, "Blanche," your digestive organs are out of order and your blood is impure. There is no use saying this is not so; that you "know better;" your skin is positive evidence against you. When your liver and kidneys do not perform their work properly, your blood retains a great deal of impure matter that, instead of helping to build up healthful tissue, is poisoning your entire system. Here and there, when it can no longer be carried in the circulation, it is deposited, and each effete atom becomes a centre of corruption. Your disfigured face warns you that it will not do to let this state of things continue. If neglected, the poison may increase, before very long, to such an extent as to be fatal.

If the proper excretory organs fail to do their duty, nature makes heroic efforts to push the offensive foreign matter out to the surface, and, speaking in a general way, the skin strives to do the work of the liver and kidneys. That is why you have pimples. Of course, put to such use, the skin cannot be healthy. Its pores become clogged, and the result is your displeasing harvest of "black-heads." You can squeeze them out, one by one, with the barrel of a watch key, but not fast enough to keep pace with their growth. As for the pimples, you may be thankful they come out, for if they did not your internal condition would soon make you a much sicker girl than you are at present.

Now, as it is presumed that you are a sensible person, and your object is the getting rid of these blemishes, we will tell you how to do it. In the first place, if your bowels are not regular in their action, use Ayer's Pills, as a measure of immediate relief; then begin to take Ayer's Compound Extract of Sarsaparilla. The name looks formidable, but the medicine is pleasant, and before you have finished a bottle of it you will find yourself improved in health and strength. Soon you will be

in the enjoyment of such consciousness of well-being as you certainly have not felt since the first pimple appeared on your skin. The use of this remedy must be persevered in until the cure is complete. Do not be alarmed if, during the first week, your pimples seem to increase in number. If they come out freely, it is the best evidence you can have, in so short a period, that the medicine is doing its work. You may comfort yourself with the assurance that in a brief time all deleterious matters will have been expelled from your system, while the blood-supplying and blood-cleansing organs will have been stimulated to vigorously healthful action. Under these changed and improved conditions—your blood being pure and your vital forces renewed—your skin will be as smooth, clear and beautiful as that of a prize baby.

You should always avoid "rich" and greasy food, but particularly while you are following this course of treatment, if you would have the medicine act quickly and thoroughly.

It is worth noting, also, that if you take a gentle course of Ayer's Sarsaparilla in the Spring, you will have no trouble with "prickly heat," "hives," "sties," or "boils" when summer comes. There is no other alterative medicine so good as Ayer's Sarsaparilla. It is compounded from the best blood-making and blood-purifying ingredients, some of which are found only in this preparation, and our recommendation of it is based upon positive knowledge.

BUSINESS NOTES.

HORSFORD'S ACID PHOSPHATE

IN INDIGESTION, AND AS A NERVE FOOD.

Dr. H. O. Hitchcock, Kalamazoo, Mich., says: "I have used it in many cases of indigestion depending upon nervous exhaustion, with marked benefit. It appears to be a good nerve food."

LEA & PERRINS' SAUCE.

Lea & Perrins', the original and genuine Worcester-shire Sauce, has been before the public over a half a century. Like all popular favorites it has long been the standard of comparison and the pattern for counterfeiters who not being able to imitate its excellence offer to the public imitations in bottling, labels and style of putting up. They dare not counterfeit the signature of Lea & Perrins which is on the red label of every genuine bottle, and of which this is a facsimile.

Lea & Perrins

To be sure of obtaining the genuine article, see that the above signature is on the label.

LACTOPEPTINE.

The most important remedial agent ever presented to the Profession for Dyspepsia, Vomiting in Pregnancy, Cholera Infantum, Constipation, and all Diseases arising from imperfect nutrition.

Lactopeptine precisely represents in composition the natural digestive juices of the Stomach, Pancreas and Salivary Glands, and will, therefore, readily dissolve all foods necessary to the recuperation of the human organism.

CAUTION

We regret that we are compelled to caution the profession in prescribing Lactopeptine, but very careful investigation has proven to us clearly the necessity of it. Substitution of cheap and worthless compounds are being made in many cases where Lactopeptine is prescribed.

Lactopeptine is always UNIFORM, and its effects are SPECIFIC, and no one has ever been able to imitate its digestive value. If you do not obtain positive results when you prescribe Lactopeptine, you can be sure that some substitution has been made, and in such cases it may be necessary for the physician to prescribe Lactopeptine in the original ounce package to insure certainty of obtaining the genuine article. We can confidently make this assertion, knowing the scrupulous uniformity in digestive value of every ounce of Lactopeptine.

Lactopeptine has always been kept strictly in the hands of the Medical Profession, never having been admitted in any publications but Medical Journals. It is prescribed by the most intelligent and educated physicians in all parts of the world, and there are but few physicians who have ever used Lactopeptine that will not agree with the late Prof. L. P. Yandell, when he says: "Lactopeptine is one of the certainties in medicine, and in this respect ranks with Quinine."

In the various forms of Dyspepsia, in vomiting in Pregnancy, and in Mal-nutrition of children, there is no known remedy so positive in results.

P. O. Box 1574. **THE NEW YORK PHARMACAL ASSOCIATION, NEW YORK.**

A BUSINESS BENEFIT.

ADVANTAGES TO ADVERTISERS OFFERED BY THE AMERICAN ANALYST.

It has not the limitations of a daily paper. No one reads yesterday's paper. A monthly lives at least a month, while a semi-monthly is fresh twice a month, and its audience is not limited by geographical lines, but the circulation is all over the United States and Canada.

It contains matters of interest to everyone, especially the ladies of the household, and is, therefore, sure of a careful perusal. Our audiences are intelligent and of the better classes, who have money to spend, and any well worded advertisement in our columns, giving real information, will receive a careful perusal.

Our rates are as low as our circulation affords. Large circulation and original matter cost money, and those advertisers who desire to realize these benefits must expect to pay reasonably for them.

Advertisements in our columns are permanent. Most of our subscribers bind their numbers.

Our advertisements are set up in an attractive form, sure to call the attention of the reader.

Anything that our readers want, or for which a demand is to be created, not wholly of a local nature, will pay to advertise with us.

We take only advertisements from legitimate houses of really meritorious goods, and give them all the editorial assistance they deserve; consequently our readers knowing this, have confidence in advertisements contained in our columns.

The fact that we have the best and largest houses in every branch of trade advertising with us, and that they always renew as their seasons arrive, proves beyond a doubt that they have found the **AMERICAN ANALYST** a good advertising medium. Why should not you?

OUR MISSION.

WHAT THE AMERICAN ANALYST IS DOING.

FIGHTING ADULTERATION.

The steadily growing favor which the AMERICAN ANALYST is constantly receiving at the hands of both the reading and the business public is the best evidence that could be afforded of the useful field of effort it occupies. It was the pioneer journal in this country to take up the fight against adulteration, and stands to-day, by public acknowledgment, the only competent exponent of the principles involved in that momentous struggle. To this end the realm of sophistication and fraud has been thoroughly explored, and its corruptions, as far as practicable, exposed to the public view. Charlatans, adulterators, and handlers of poisonous food have been summarily and uncompromisingly dealt with. Humbugs seeking to enrich themselves, through the sale of high-sounding specifics for human ailments, have been subjected to the crucial test of thorough chemical analysis of their goods, and where the latter, as too frequently occurred, proved to be utter frauds in name, composition, and pretended effects upon the system, the real facts have been placed before our readers in order to save the public from further unconscious imposition. The veil of chemical mystery in which tricksters of this kind ostentatiously envelop their processes of manufacture, protects them as yet from the criminal laws to which other confidence operators are held amenable, and the only method for counteracting their nefarious schemes is through public exposure by the newspaper press. In exposing this species of fraud, the AMERICAN ANALYST has conferred a benefit upon the community, to which the latter is giving grateful and substantial recognition.

SANITARY AND FOOD REFORMS.

In addition to the foregoing, the AMERICAN ANALYST is in constant co-operation with the Boards of Health of this and other cities, in efforts to secure sanitary and food reforms through organized methods, and while it is nobody's mouthpiece, it is conceded to be the only pop-

ular medium through which those bodies can bring their purposes and action intelligently before the general public. Reaching as it does all classes, manufacturers, merchants, physicians, chemists and private families all over the land, its influence is exerted over a vast radius, producing results as visibly marked as they are widespread.

DOMESTIC DIETETICS

Is a department of special interest to ladies. It is very different and far superior to the ordinary cookbook, in that it tells the housewife suggestively what to buy, what foods are in season, as well as how to prepare the many varieties of dishes, all in a practical way easily followed. Other matters of great interest to housewives are also discussed.

PRACTICAL DISCUSSIONS.

Numerous other interests are also faithfully represented in our columns, such as articles relating to common experiences of society, the question of hygiene, and an infinite variety of practical subjects. In short, the AMERICAN ANALYST also keeps abreast in giving the fullest information on all matters directly or indirectly in the line of its proper field.

SCIENTIFIC INVESTIGATIONS.

The business transacted in the office of the AMERICAN ANALYST does not by any means all come to the surface in the pages of the paper. Minute analyses of chemical compounds, careful assays of minerals, examinations of questionable oils or doubtful condiments, and the many subtle operations incident to laboratory work are constantly required of us by correspondents far and near, and the results in many cases are not publicly recorded. In this manner, the influence of the paper encompasses a vast radius, from every point of which we receive constant expressions of approval, verbally, and in more substantial shape.

ITS VALUE TO ADVERTISERS.

No person can scrutinize the advertising pages of this journal without being impressed with the uniform high character of the numerous houses who find our columns the most desirable—because the most effective—medium for advancing their interests throughout the country in the several directions to which they respectively pertain. The steady growth of our subscription lists, extending to every State in the Union, and in fact all over the world, affords another gratifying evidence of the approval given to our endeavors to sustain genuine manufactures, and to expose spurious, fraudulent, and harmful knavery.

SUBSCRIPTION \$1 PER YEAR.

Considering the amount of practical information regularly embodied in its contents, together with the fact that the subscription price for an entire year is only one dollar we believe the day is approaching when the AMERICAN ANALYST will be regularly welcomed in every intelligent household in the land. Address,

ANALYST PUBLISHING Co.,
19 Park Place, N. Y.

ELECTRICAL FISHING.—An electric globe light that will shine in twenty fathoms of water is now sought for use in the pearl fisheries.

AN IMPERIAL STATE.—California has five counties each containing a greater extent of territory than the great State of Massachusetts with its 2,000,000 inhabitants, its 352,000 wage-workers in factories, its \$300,000,000 capital invested in manufacturing enterprises and its sixteen cities of more than 20,000 each. She grows one-fourth of all the barley in the United States and produces one-third of all the gold. Only three States excel her in forest acreage; only fourteen States contain more miles of railroad. She produces one-tenth of all the wool in the United States. Only two States raise more hops, only five produce more salt, only nine more soap. Her fruit future is beyond conception, for she already has 300,000 orange, lemon and olive trees, and 4,000,000 deciduous fruit trees, while her vineyards are more extensive than those of any other ten States in the Union.

A NEW USE FOR LIQUID PEPTONOIDS.

Successfully used in Dissolving the False Membrane in Diphtheria.

A Physician writes: "In an experience of over thirty years I have never used anything to equal your LIQUID PEPTONOIDS as a local application with a spray. It will dissolve the membrane and destroy the diphtheretic odor in less than twenty-four hours. I use the LIQUID PEPTONOIDS full strength, as a spray, two or three times a day, in bad cases."

Used successfully by another physician in two desperate cases:—"I was induced to try LIQUID PEPTONOIDS in two very desperate cases of DIPHTHERIA. I think I never saw throats more heavily coated with exudate than were these, and I think I never saw it more rapidly disappear than in these cases, by frequent spraying with your LIQUID PEPTONOIDS."

LIQUID PEPTONOIDS can be taken by patients unable to ingest food in any other form. In dyspepsia and loss of appetite its effects are positive, its digestive properties assisting in the digestion of food taken and its peptogenic properties quickly stimulating the natural digestive secretions of the stomach.

PANCROBILIN.

Prepared (in both Liquid and Pill form) from Extract of Pancreas and Bile.

This preparation is designed expressly to increase the digestion and absorption of fats.

We believe that the fat-digesting properties of pancreatine and bile are inseparable, and that without their union in the intestinal tract but little, if any, fat would be digested and absorbed.

PANCROBILIN will be found of great service in Phthisis and other wasting diseases, Nervous Prostration, Constipation, Inanition, Malnutrition, Intestinal Indigestion and wherever there is a failure to assimilate fats.

If the skin is first wet with LIQUID PANCROBILIN, the inunction of oils will be greatly facilitated.

LIQUID PANCROBILIN is put up in pound bottles. PILL PANCROBILIN is put up in bottles holding 100 pills. The coating of the pills will resist acid digestion, when given as directed, but will be quickly dissolved in the alkaline secretions of the duodenum.

PHOSPHO-CAFFEIN COMP.

(Granular Effervescing.)

Formula for each dessertspoonful:—

Caffein.
Acidi Phosphorici aa, grains, ss.
Antipyrin.
Ext. Apii. Grav. dulc. (Celery), aa grains, j.
Sodium Bromide, grains, v.

The satisfactory results produced by PHOSPHO-CAFFEIN COMP. in Headaches, Neuralgia, Insomnia, Neurasthenia and general Nervous Irritability, are not due to the effect of any one ingredient, but to the happy effect of the combination. A thorough series of comparative tests have demonstrated the superiority of the above formula over any other in the market.

REED & CARNRICK, New York.

PEACOCK'S BROMIDES

(SYR: BROM: COMP: PEACOCK)

NERVE SEDATIVE.

Each fluid drachm represents 15 grains of the Combined C. P. Bromides of Potassium, Sodium, Calcium, Ammonium and Lithium.

USES:—EPILEPSY, and all CONCESTIVE, CONVULSIVE, and REFLEX NEUROSES.

This preparation has stood the test of time and experience, and can be relied upon to produce results, which can not be obtained from the use of commercial bromide substitutes.

DOSE:—One to two FLUID drachms, in WATER, three or more times a day.

A VALUABLE BOOK FOR NOTHING.

The AMERICAN ANALYST will send to any person who will forward a New Subscription with One Dollar, a copy of

THE FAMILY CYCLOPÆDIA OF USEFUL KNOWLEDGE.

This is unquestionably one of the most interesting, entertaining and instructive books ever published. It is a universal educator for every member of the family circle, filled with useful information from beginning to end, and this information is given in such an attractive and pleasing way that the book is quite as entertaining as it is instructive. It treats of hundreds of subjects of which no man, woman or child who seeks to be well informed can afford to be ignorant, yet of which the masses of people are entirely unlearned. It contains the cream or substance of a dozen ordinary volumes, and is one of the most valuable and useful books a family can have in the house. No living man is so well informed that he may not learn from it. It is a book for the masses, for old and young, rich and poor, and will be read with pleasure and profit by all. It will likewise be found of great value as a work of reference. The book is profusely and elegantly illustrated, and is conveniently divided into departments, as follows: **Biography, History, Natural History, Travels, Manners and Customs, Etc.; The World Illustrated, Useful Arts and Manufactures, Trees, Plants, Fruits, Etc.; Great Inventions, Mining, Wonders of the Sea, Familiar Science, Law for the Masses, Statistical and Miscellaneous.** All the above subjects are fully and ably treated in this valuable book. It is a vast storehouse of useful and entertaining knowledge—unquestionably one of the best and most valuable books ever published in any land or language. No cyclopædia ever heretofore published at twice the cost is to be compared with this book in point of artistic make-up, beauty, and excellence of illustration, and quality of contents. As a holiday or birthday present for any one, nothing more appropriate or acceptable could possibly be selected. THE FAMILY CYCLOPÆDIA OF USEFUL KNOWLEDGE is a large and handsome book of 544 pages, 12mo, printed upon fine paper and elegantly bound in cloth, embellished with artistic designs in black and gold. It contains **Two Hundred and Seventy-three Beautiful Illustrations**, the original cost of which was over \$5,000. The book will be sent by mail, post-paid, to any person sending a **New Subscription with One Dollar.** It is as large and handsomely gotten up as books usually sold at \$1.50 and \$2.00, and in the quality of its contents is worth a dozen ordinary volumes.

ADDRESS ANALYST PUBLISHING CO.,

—19 PARK PLACE, NEW YORK.—

Tabasco Pepper Sauce

OR LIQUID PEPPER.

Is simply the Pulp of the Ripe Pepper Extracted by Pressure.

The seed of this Pepper was obtained from Central America, and by careful cultivation in Louisiana for many years has been so improved in strength, flavor and aroma, as to have become a new variety of Red Pepper, superior to all others. The pulp is so handled as to retain all the flavor, strength, aroma and color of the ripe fruit, and to keep unimpaired in any climate. It excites the appetite, promotes digestion, and is pronounced, by connoisseurs, to be the finest condiment in the world. For medicinal purposes it recommends itself by its purity, strength and diffusible form.

Manufactured by E. McILHENNY,
NEW IBERIA, LA.

For Sale by all Wholesale Grocers.

NATRONA BI-CARBONATE OF SODA.

(ABSOLUTELY PURE.)

The nature of the raw material from which NATRONA BI-CARBONATE OF SODA is made—viz., kryolith, a mineral containing *pure sodium*—insures a purity and uniformity of product which cannot be obtained from any other known material. In making BI-CARB. SODA from any other raw material, the use of sulphuric acid is a necessity, but none is used in any part of the process of making NATRONA BI-CARB.; hence its entire freedom from the slightest trace of arsenic, which is always present in ordinary soda. Its absolute purity and entire freedom from all traces of *sulphate of soda*, common salt and other impurities, render NATRONA BI-CARB. NEARLY TASTELESS, and being bolted through the finest bolting-cloth, insures the finest stage of division.

To these indisputable facts the attention of CONSUMERS of soda is specially called. They are IMPORTANT, and should influence both those who use and those who sell soda, to buy and sell NONE BUT THE BEST.

The NATRONA BI-CARB. Soda is kept in stock by almost every wholesale druggist and grocer throughout the United States, of whom it may be ordered.

Natrona Bi-Carb. Soda is unequalled by any other brand of English or American Manufacture.

PRICE BAKING POWDER CO. NEW YORK. CHICAGO, ST. LOUIS.

COLDEN'S LIQUID BEEF TONIC.

AN INVALUABLE AID IN THE TREATMENT OF ALL CASES OF DEBILITY.

Established 15 Years. Endorsed by Scores of Physicians. Essentially Different from all other Beef Tonics. Beware of Imitations.

COLDEN'S LIQUID BEEF TONIC consists of the Extract of Beef (by Baron Liebig's process), spirit rendered non-injurious to the most delicate stomach by extraction of Fusel Oil, soluble Citrate of Iron, Cinchona, Gentian and simple aromatics. An official analysis of this preparation by the eminent chemist ARTHUR HILL HASSALL, M. D., F. R. S., and an endorsement by SIR ERASMUS WILSON, F. R. S., is printed on the label of each bottle.

Its Range of Action Embraces all Cases of Debility.

By the urgent request of several eminent members of the medical profession, I have added to each wineglassful of this preparation two grains of SOLUBLE CITRATE OF IRON, and which is designated on the label as "No. 1," while the same preparation, without Iron, is designated on the label as "No. 2." It acts directly on the sentient gastric nerves, stimulating the follicles to secretion and gives to weakened individuals that first pre-requisite to an improvement, an appetite.

I will, upon application, send a sample bottle of Colden's Liquid Beef Tonic to any physician in regular standing. Please ask your Dispensing Druggist (if he has not already a supply) to order it. In prescribing this preparation physicians should be particular to mention "COLDEN'S" viz: "EXT. CARNIS. FL. COMP. (COLDEN)." It is put up in pint bottles and can be had of Wholesale and Retail Druggists generally throughout the United States.

A SOBER SECOND THOUGHT.

One of the most ably-handled commercial journals of the country is the *Bulletin*, of Minneapolis, whose weekly discussions of economic questions, despite their justifiable bias in behalf of local interests, are uniformly marked by sound judgment and clear and comprehensive breadth of vision. We were accordingly somewhat surprised on a recent occasion to read in its columns an editorial article favoring the passage by the Minnesota Legislature of a bill requiring local "inspection on the hoof" of beef cattle whose meat is to be offered for sale anywhere in that State; or, in other words, the peremptory exclusion from the Minnesota markets of beef slaughtered outside the Minnesota boundaries. The point, however, which the editor emphasized in his discussion of the subject was that, though the projected law might conduce to the advantage of the large local slaughtering establishments, and therefore should be sustained, it could be advocated only on the ground that

its adoption would check "the enormous aggressions" of the Chicago dressed beef concerns. It is gratifying to see, however, that further reflection on the subject has brought the *Bulletin* to a perception of the inconsistency of its original conclusions. There are other and higher considerations to be taken into account in this discussion than those contingent upon the petty prejudices of rival interests. There are constitutional rights involved in it that may not be invaded. The privileges that are guaranteed equally to the citizens of all the States cannot be abridged for the benefit of those of any single State. The whole proposition of the "local inspection" agitators is monstrous, illegal and revolutionary, and their success in blinding the eyes of any legislative body into acquiescence with the measure would be speedily annulled when the subject should be brought before the courts for adjudication. Those are the views which the *AMERICAN ANALYST* has maintained from the beginning of the controversy. How well and logically they are supported by the "sober second thought" of the Minneapolis *Bulletin* will be seen by reference to the article quoted from the issue of that paper of March 30th, which we elsewhere reprint, and to which we commend the attention of all our readers interested in the subject.

LAW vs. PHYSIC.

The New York *Medical Times*, a journal devoted to medical matters among those who practice medicine according to the homœopathic theory, has asked a legal opinion of that eminent jurist, Judge Geo. C. Barrett, as to the right of a physician styling himself a homœopathist and as such called in to attend a patient, to adopt any other than homœopathic means in the treatment of the case. The answer is what might have been expected. The judge, in the start, refuses to give an opinion on the legal aspects of the case, but limits his answer to the question of professional ethics. He could not well do otherwise, because a legal opinion can only be given on a full statement of facts. In the case under consideration, it was not stated what "homœopathic treatment" really implies. It is generally admitted that homœopathy does not consist in what the general public erroneously believes to be the vital distinction, the administering of minute doses. Neither is the judge's definition of small doses of a single drug administered upon the principle of *similia similibus curantur* correct. He is still further in error when he designates a dose of quinine, iron, morphine or other medicaments as *per se* not homœopathic. But when in his closing sentence the learned Judge, as he acknowledges, does more than simply answer the question propounded, he builded wiser than he knew. He there enunciates a broad, liberal and absolutely incontestible principle, to which every intelligent person can honestly assert. These are the words: "If, however, we are to have a class of men who purpose, in the interest of humanity, to utilize the best that they can find in any and every school, 'pathist,' as a designation of fixed methods of practice, must be ignored, and the broad and noble title

'physician,' in its unreserved sense, be revived and substituted. The patient will understand, when he sends for one of this class, that he is to have the physician's best judgment in the unprejudiced use of the ripest fruits of modern discovery in every field."

CIGARETTES AND THEIR CONSEQUENCES.

There can be no doubt that the excessive use of alcoholic stimulants is the curse of the land, as the smoking of nasty cigarettes is the vice of the day. Joe Howard has well put it when he says that the former is destroying our men and women, while the latter is dueling our boys and girls. Effeminate-looking boys, strutting about with vile-smelling cigarettes in their mouths, a nuisance to everybody, would be bad enough, but well-informed physicians say that cigarette-smoking has largely increased pharyngeal, bronchial and catarrhal troubles, which are fast laying the seeds of phthisis, filling our hospitals and cemeteries with consumptives faster than an epidemic. Another evil effect of the cigarette habit was recently brought to our attention by a prominent tobacconist. He says that it has enormously increased the number of smokers and the amount of tobacco consumed, not only by this addition to the ranks of smokers, but out of all proportion the amount smoked by those who were only moderate cigar-smokers before, and have now become cigarette fiends. The subject certainly furnishes food for serious thoughts.

PAINTED WOMEN.

If common rumor is to be believed, our women of the upper and middle classes have far too generally adopted the harmful and detestable practice of imparting artificial color to their faces and fictitious whiteness to their necks. Some even enamel their shoulders and arms—at least, so we are told—animated by a feeling akin to the professional enthusiasm of the provincial actor, who, upon being unexpectedly cast for the part of Othello, promptly blacked himself from head to foot, in order to be perfectly in keeping with the important role assigned to him. The application to the skin of these red and white compounds, the basis of which is too frequently some poisonous mineral substance, is a dangerous and silly usage—plainly speaking, a barbarous custom, more honored in the breach than in the observance. Actors and actresses, whose faces are exposed to a strong artificial light whilst they are on the stage, are compelled to use pigments in order to heighten their natural color, as well as to disguise their individuality, as the saying goes, "beyond recognition." They are, however, for the most part extremely careful not to apply anything but vegetable preparations to those portions of their epidermis which have to undergo superficial treatment in obedience to theatrical exigencies. Many ladies in private life, we regret to say, are not so particular; consequently they ruin their complexions and impair their health by "beautifying" themselves with cosmetics and powders, into the com-

position of which enter such deleterious matters as lead and zinc, bismuth and belladonna. We entertain all manner of objections to beauty shows, too numerous to set down in this place; but, if the coming display in Paris should serve as a practical protest against the prevalent abuse of "maquillage," we shall unhesitatingly accord to it the expression of "mitigated disapproval." A "horrible example" of this species of art, may be had any day in Fourteenth street in this city. There in a shop for the sale of all kinds of alleged improvements for women, from the crown of their heads to the soles of their feet, may be found the proprietress, "old mutton dressed up as young lamb." A glance at her make-up will suffice to satisfy the most ambitious whether she would like to look "improved," as that female evidently thinks she is, or would make others believe her to be.

NERVES AND NOISES.

The most sensitive, delicate and easily injured parts of the human system are the nerves. These never can become so accustomed to incessant strain as to escape injury. That which is unpleasant to the senses is always—and, so far as the sense of hearing is concerned, discordant noises always are—injurious to the nerves. The yelling of steam whistles, the hiss of steam pipes, the rattle and clash of wheels on stone-covered streets, the rumble of street-cars, the clangor of bells, the howling of hucksters, keep up a condition in which a healthy nervous system of natural strength and sensitiveness is impossible. And there is not one of those agencies that is not suppressed more or less completely in most of the great cities of the world. In Berlin heavy wagons are not allowed on certain streets. In Paris any car-load of rattling material must be fastened until it cannot rattle. Munich allows no bells on street cars. In Philadelphia, church bells have been held a nuisance in certain neighborhoods by judicial ruling. Steam whistles are forbidden in nearly all the larger cities of this country, and most of these noises in our advanced stage of civilization are utterly unnecessary. Clocks and watches are now so cheap and plentiful that steam whistles and bells to denote the time are useless. Why should not all useless noises, and nearly all are useless, be suppressed?

ARTIFICIAL VICHY.

Carl H. Schultz, a mineral water manufacturer of this city, has commenced a newspaper attack upon all such competitors as he dares to mention by name, in which he uses a curious conglomeration of figures called an analysis, which are perfectly unintelligible, not only to the ordinary reader, but to the trained chemist. All

that they amount to is a sort of comparative statement, in which unmeaning decimals are used to show the great superiority of Schultz's vichy water over all others. In fact, in that muddled way of showing it, Schultz's imitation was even better than the genuine natural vichy. To explain the so-called comparative analysis, as well as such a misleading table can be explained, it seems to be based on Bauer's analysis, which gives the constituents notoriously high, and in order to bring it up in the most misleading way possible, the contents of some seven syphons, containing about 198½ ounces have been analyzed, and the result given in grains. No particulars are given as to the reason for the apparent discrepancy between the two components given and the total solids found. It is important to remember that all our mineral water manufacturers have to make their waters to sell especially to liquor stores, and in such places the natural mineral waters, like vichy, could not be used. Mr. Schultz should remember that such chickens always come home to roost.

AN APRIL FOOL.

Last week we quoted an article from the *Albany Merchants' Mail*, denouncing the fraudulent scheme which the Eastern butchers are managing, in order to lower the quality and raise the price of beef. We gave full credit to the source from which the extract was taken, only claiming as our own our assent to the views it expressed. The following idiotic effusion, which that republication has elicited from the *Butchers' Advocate* of this city, is both amusing and confusing. It is funny as a specimen of metropolitan Billingsgate, and it is, at the same time, puzzling in its incoherency, the *Advocate* man having gotten himself so hopelessly mixed. After careful examination, we are inclined to attribute it to the combined influence of gin and stupidity.

LOST TO ALL SHAME.

That disreputable old female in the journalistic field, the *AMERICAN ANALYST*, lost to all sense of the shame it should feel after selling its honor to the dressed beef syndicates, had another spasm last week over some incoherent rantings of its sister in shame, the *Merchants' Mail*, of Albany. It says:

The *Merchants' Mail*, of Albany, strikes the nail on the head in the following retort to an attack upon Chicago dressed beef by one of our local contemporaries: "The *Butchers' Advocate*, of New York, grows frantic in its efforts to persuade its readers that Chicago dressed beef is unwholesome, not fit to eat, and people do not know what they are eating when they have it upon their tables. Such ranting is the worst kind of bosh, and no intelligent man for a moment will give it any consideration. As far as health is concerned, we prefer a thousand times Chicago beef to home dressed, and so does the majority of consumers."

Such stuff as this is hardly worth noticing, but as the rabid jabbering of an idiot may at some time need correction we have noticed the above. We can't just see how it is the concern of the great reading public what kind of meat this disreputable old lady prefers. It can eat the flesh of asses if it chooses, and it would not require an over great mental effort to conclude that it is its staple food, judging from some of the matter it has served up on this subject. Then, again, we doubt whether the old reprobate knows the difference between healthy and diseased meat when she sees it, and may have been eating the produce of lumpy-jawed cattle without knowing it. There are some people in this world that even disease won't have anything to do with. This hired heeler of the Big Four next goes on to say:

They may possibly have hayseed in their hair; but all the same they know there is no better inspection in the country than that carried on by the Chicago men, and so does every other well informed man. These Western men invite anyone that so desires to come and investigate their inspection.

If anything more were wanted to convict this "fake" weekly analysis of being in the power, body and soul, of the Big Four, what would be better than this. Ninety-nine out of every hundred men in this country knows that the inspection at Chicago is as lax and farcical as could be imagined. The committees of the national and various State legislatures which have looked into the matter have unearthed enough testimony to that effect to convince anybody whose mind was not made up on a basis of dollars and cents. We have

heard of certain individuals who keep on telling the same lie over and over until at last they come themselves to believe what they say really did happen. This is the only manner in which we can account for the course of the *ANALYST*. When its masters took possession of it and fastened their collar around its neck, they gave it certain arguments to put forth and statements to make which the poor slave was compelled to keep repeating under penalty of the scourge. This it has done until now, notwithstanding the fact that its statements and arguments have all been exploded long ago. It keeps on reiterating them, until it has brought its poor imbecile's mind to believe in them. At least this is the most charitable view we can take of the subject.

EASTER FESTIVITIES.

QUAINT CUSTOMS OF VARIOUS NATIONS IN EASTER CELEBRATION.

The festival of Easter has, since the time of the Emperor Constantine, been celebrated throughout the Christian world with much pomp and great signs of rejoicing. Aside from the religious features of the day, it is a period when every housewife puts forth her best efforts for the entertainment of her family and friends, seeking to indemnify them for the lengthy forty days of abstinence. Almost every country has a number of national dishes, considered appropriate to the religious holiday. Eggs were a forbidden article of diet in the primitive church during Lent, and they consequently accumulated in such quantities that at Easter they were distributed among the children. Originally, they were only dyed red, in remembrance of the blood of our Saviour which was shed upon the cross, and also as emblematic of the scarlet cloaks of the cardinals. Eggs were also indicative of fecundity, and when offered as gifts to friends, were intended to be an expression of the best wishes of the giver for a long life and continued prosperity. With the Egyptians, they were figurative of the survival of mankind after the deluge. To the Jews, they signified the emancipation of the children of Israel from Egyptian bondage, and were partaken of in common with the paschal lamb at the feast of the Passover, which falls at the same time as Easter. The Romans considered the egg as the origin of all things, and they were in the habit of beginning their repasts by eating them. To the Christians they represented the resurrection of Christ, who arose from the tomb just as the tiny chick comes forth from the walls of its fragile prison. Eggs formed a prominent dish at every Easter entertainment, for the superstitious imagined that they possessed the power of sanctifying the body after the long and tedious Lenten fast. Immense baskets filled with them were borne into the churches, where they were sprinkled with holy water and blessed by the priest. The servants then carried them to the different houses, where they were heaped in huge chargers and placed in the centre of the table and covered with a fine white damask napkin, over which was strewn a profusion of spring flowers. Twelve dishes of meat were ranged around the egg platters, which remained on the table during the whole of Easter week. Every visitor was invited to help himself to an egg, and it was considered a breach of etiquette to refuse. At Queen's College, Oxford, a feast of eggs was provided for the scholars at Easter. The first dish which was brought on to the table was a red herring, seated astride of the rude effigy of a horse, riding over a field of corn salad. This was intended as a farewell to Lent. Ham and a gammon of bacon were numbered among Easter dainties, being intended to be eaten as a sign of abhorrence with which all good Christians regarded the Jews. A tansy cake was another dish which was partaken of in remembrance of the bitter herbs of the Jews. At Twickenham, two enormous cakes were baked at the expense of the church, and divided amongst the young people of the parish. This time-honored custom was abolished by an act of Parliament, being regarded as a relic of superstition. The money was afterward employed in the purchase of loaves of bread, which were flung down from the church steeple and scrambled for

by the populace. Pies shaped like coffins were apparently much relished. They were made to imitate the cratch or manger in which Christ was laid at his birth. These toothsome delicacies were in great demand among the lower orders. Parties of youths and maidens also went pudding-pieing, as the pastime was called. They roamed in bands from one public house to another, devouring pudding-pies. These were small cakes, similar to cheese-cakes, which were filled with custard and the top sprinkled with currants. They were washed down with copious libations of currant wine. At Easter, the church wardens in many districts brewed a strong beer, called church or Easter ale. They served this beverage to their parishioners, who drank it, eating the provisions they had brought to church with them. In return, they offered some small gratuity to the priest. This custom at last degenerated into regular drinking bouts, and became such a prolific source of scandal, it was discontinued, much to the regret of the people. Another seasonable beverage was called baggot, being a mixture of ale, sugar and aromatic spices; it was a drink held in high repute. In Ireland, the peasantry celebrated the Easter season with loud demonstrations of great joy. The good wife provided an enormous pot of boiling water, which was suspended over the glowing great fire. Into this she threw several fat chickens, a piece of bacon, and anything else that suited her taste. The family were gathered about the huge fireplace, anxiously watching the preparation of the seething mass. Woe betide the hungry wight who was tempted to taste it before the hour of midnight. As the last sound of the striking clock died away upon the stillness of the night, a loud clapping of hands was heard, interspersed with peals of merry laughter. All the company repeated an Irish phrase which means "out with the Lent." Great dishes of steaming food were placed upon the long table, and the entire family gathered around to partake of the appetizing viands. After supper they retired for a brief period, rising betimes to see the sun dance in honor of the Resurrection. To this day the peasantry firmly adhere to this superstitious belief in many parts of Ireland. In Russia, immense quantities of a sort of cake, filled with almonds and raisins, were prepared and offered for sale at all the booths. One became very tired of this substitute for bread, as the bakeries were closed, and no fresh loaves could be procured for three days. At the feast of the Passover, two dishes of the paschal lamb were placed upon the table. There were also two loaves of unleavened bread, some meal, two small fishes, and a hard-boiled egg. The meal was because of Behemoth, the fish because of the Leviathan, and the egg because of the bird Ziz. These three dishes were supposed to be the food of the blessed in a future existence. The Poles have always been noted for their strict observance of the festivities of the church. Nowhere save, in this country, have the entertainments been preserved in their pristine glory, flavored with a touch of barbaric magnificence. The entire Easter season was dedicated to an endless round of feasting. A traveler in Poland describes a feast in which he participated as exceeding in lavishness of display and wealth of decoration anything he had ever beheld. The walls of the dining-room were hung with trophies of the chase, and the battered helmets and shields of a long line of ancestry. On the immaculate linen of the table were placed quantities of massive silver dishes holding the choicest viands, and supplemented by costly wines of the rarest vintages. A lofty tower of pastry or sugar, decked with wreaths of glossy ivy rose majestically from the centre of the board. A roasted lamb, still clothed in its snowy fleece, performed the functions of warder. It was in the act of unfurling a crimson pennon, inscribed with the motto: "Alleluia!" emblematic of the resurrection of the Lord. This was surrounded by a fortification of sweetmeats, sugar plums, and delicious fruits. Next came a pyramid of hard-boiled eggs, around which were coiled, like writhing serpents, links of sausage, representing the ordnance stores of the castle. A wall of saffron cake arose majestically, its

battlements formed of sponge cake. These fortifications were traversed by avenues made of smoked tongue, pickled herrings, and other kinds of fish. A covered way was formed of roast joints, ham, fowls, and game. The bastions were made of solid gold, and silver flagons, filled with foaming mead and ruby and amber wine. This terminated in a *glacis* of magurkas, a kind of sugary cake, on whose glassy surface were traced various mottoes appropriate to the season. The guests assembled around the hospitable board, awaiting impatiently the signal to storm the appetizing battlements. The priest raised his eyes towards heaven, pronouncing the solemn benediction, and sprinkling the table with holy water. The host cut up a hard-boiled egg into thin slices, which he presented to his guests, dividing a slice with each one in turn. Then the business of the day commenced in good earnest, and the ramparts soon presented a scene of ruin and disorder. Many people assert that the nobles only tasted of the good things on the table, giving the rest to the servants and tenantry. After dinner, the company repaired to the balconies to watch the peasants, who had assembled in their gay costumes. They had armed themselves with huge baskets of provisions which were blessed by the holy man, and they retired after having received presents of food or money from their masters. In some remote provinces of France the priest goes from house to house, blessing the inmates, and in return is given donations of eggs, enough to last him for many weeks. In Italy the children have a feast, and the day is one of as great importance as Christmas is with us. In England and America it is celebrated by a plentiful dinner, in which no particular dishes play a prominent part, except the turkey, which everywhere in this country graces all the feasts as it also does in the old country. Many generations of American children have indulged in the time-honored custom of egg-rolling in the grounds of the White House at Washington. On this day the grass plots, which are already green in that mild climate, are alive with myriads of school girls and boys. Each one brings a basket which contains a lunch, supplemented with quantities of hard-boiled eggs. The fun begins when the little ones commence matching eggs. I believe the ones that withstand the greatest number of blows without being cracked are the winners. The grounds ring with peals of merry laughter, and all day long the sport continues. At set of sun the children separate leaving the debris of mountains of white egg shells and other relics of the luncheon strewn on the ordinarily well-kept gardens of the Presidential Mansion. It is remarkable how wide-spread the custom of celebrating Easter is, and in any civilized land it is a day of rejoicing, feasting and prayer.—COUNTESS ANNIE DE MONTAIGU, in April *Home Maker*.

A PERPLEXING MOOD.

RIGHT AND WRONG USES OF THE SUBJUNCTIVE.

A correspondent recently asked a newspaper of this city which passes for, and actually is, an authority concerning the niceties of the English language, whether this sentence is grammatical: "I asked if he was in." The correspondent was informed that the sentence should be, "I asked if he were in," and was further informed that "if requires the subjunctive." The oracle would have done better if it had explained to its correspondent that the irregular subjunctive, "be" or "were," although a very useful thing in its way, is apt to become a nuisance when it is out of its way, and is continually making trouble for those who desire to speak or write the English language correctly. It is in reality merely a short form of the regular subjunctive may, might, would or should be, and may properly be used in place of one of those expressions. Perhaps the nearest approach to a rule concerning it may be found in the statement that it may be used when the phrase implies a contingency, and not otherwise. A contingency needs the subjunctive, but "if" does not always

require it, because "if" does not necessarily imply a contingency. In the phrase referred to, the inquirer did not ask whether the other person might be or should be at home, but whether, as a present matter of fact, he was at home. Suppose we change the form. At the house, would the inquirer say, "I want to know if Mr. — be at home?" Of course not. He would properly say, "I want to know if Mr. — is at home." Therefore, in reporting the event, he correctly said, "I asked if he was at home." "I asked him if he were going to the races" is proper, because the question implies a contingency. "I asked John if his brother was at the races yesterday" is also proper, because it implies a matter of fact. On the whole, it is safe to say that there is a by no means admirable tendency toward a too frequent use of the irregular or short subjunctive, and that it is often improperly employed. Writers should beware of it, and it would be well to mark it "dangerous," as it is easily misused.

IGNORANCE NOT BLINDNESS.—Examinations in English schools go toward proving that color blindness is often declared to be present when really no organic defect but only poor training in the naming and distinction of colors is found to be the trouble.

CONGRESSES IN PARIS IN 1889.—Forty-nine Congresses of various sorts—literary, medical, mathematical, metallurgical, architectural, nautical, and commercial—have been duly authorized by a committee of the Paris Exhibition, which is presided over by M. Pasteur, who has for his associates M. Mezieres, of the French Academy, and M. Meissonier, the painter. "To these Congresses," says the *English Mechanic and World of Science*, from which we take the item, "that of the International Females will, it is expected, be added in time," which puts us in mind of the man who, when boasting that he had eaten forty-nine hard-boiled eggs, was asked why he had not eaten one more to make an even fifty, replied that he "didn't want to make a d—d hog of himself just for one egg."

BIG FIGURES.—In 1866 a Corliss engine was placed in the machine-shop of the Union Pacific Railroad at Sacramento, Cal. The engine has a 4-foot stroke and an 18-foot belt wheel, and it has been run continuously since it was placed there, frequently running night and day, often until 10 o'clock at night. Up to this date scarcely \$100 have been spent for repairs upon it. Allowing but ten hours a day and 300 working days to a year, this engine has been working 66,000 hours, at the smallest calculation, since it was placed in motion. The belt wheel makes 70 revolutions per minute, and for the 66,000 hours it has been going has made 277,200,000 revolutions. The circumference of the belt-wheel is 56½ feet and in making the 277,200,000 revolutions has traveled a distance of 15,651,800,000 feet, or 2,964,354 miles, equivalent to more than 100 times around the earth. The belt-wheel has traveled at the rate of 45 miles per hour.

CELLULAR CLOTH.—The new cellular clothing now coming into use in England is said to be a success. It is woven out of the same material as the common weaves of cloth, being simply, as its name indicates, closely woven into cells, the network of which is covered over with a thin fluff. Its porous quality allows the slow passing of the inside and outside air, giving time for the outside air to become of the same temperature as the body, obviating all danger of catching colds and allowing vapors constantly exhaled by the body to pass off, thus contributing to health and cleanliness. The common objection to cotton clothing, that it is productive of chills and colds, is removed if woven in this manner, and the invention can certainly be said to be strictly in accordance with hygienic and scientific principles.

A CURE FOR HYDROPHOBIA.—Chance has led to the discovery of a cure for hydrophobia. In Ayacucho, Peru, a man was bitten by a mad dog, and shortly after the disease developed. In his madness the man rushed from the house, and, falling among a lot of "peuca" plants, some of the juice of these plants entered his mouth and he swallowed it. A moment of reason seems to have followed, during which he seized some of the leaves, broke them, and drank of the milky and glutinous sap with which they are saturated. When his friends found him he was senseless, with the "peuca" or "maguey" leaves stretched in his hands. He was carried to his home, and soon regained his health. Experience has long since taught the Indians that "peuca" sap invariably acts as a cure upon dogs suffering from hydrophobia.

BOYCOTTING AMERICANS.

INCREASING EXCLUSION OF AMERICAN-BORN BOYS FROM THE INDUSTRIAL TRADES.

The Philadelphia *Record* calls attention to the growing extent to which American boys are prohibited in that city from learning the trades, and the same objectionable state of things is apparent in New York and throughout the country. The Philadelphia boycott is thus described: In 1880, according to the census returns of that year, only 30 per cent. of the artisans engaged in trade in Philadelphia were of foreign birth. That was a fine showing as compared with the other big cities of the country, for in Boston the percentage of foreign-born workers was 40, in New York 56, in Chicago 60 and in Brooklyn 69. It is to be feared, however, that the census of 1890 will hardly be so favorable to Philadelphia as distinctively the American city. Immigration and the trades unions have been reducing the proportion of the native element in the trades until now it is doubtful if half of those engaged are of American birth. This is plainly shown in some of the building trades. "Why, I don't believe that half of the plasterers are Americans," said a boss plasterer when asked about his trade; "the men make good wages, \$3.50 a day, and a good many of them \$25 a week, and there are not enough of them to do all the work. If it had not been that work was slack in New York last season we would not have been able to get along at all here in Philadelphia, where there was so much building going on. We would have been in a fix if there had been a big demand for plasterers in both places. The Plasterers' Union, which controls the journeymen, is a strong and well-organized body. It allows each master only two apprentices, and there is so much trouble about the matter that I don't care to be bothered by apprentices. The result is, as I said, there are now really not enough men in the trade, and that most of those in it are of foreign birth." "I don't know of a single boy in Philadelphia learning to be a stonemason," said Contractor Michael McCahey, who has had a long experience in his line of business. "From the way the masons around me talk I should judge that most of those now in the trade are foreigners. It is a hard trade, and the work is rough, but the pay is good. The men receive \$3.25 a day for nine hours' labor. The trade is not an attractive one to a boy, I will admit, as there is a good deal of lifting of heavy stone, but there is a good living in it." Among the stonecutters fully one-half are of foreign birth. These are mostly Englishmen and Scotchmen, with some Germans. The pay is good—\$3.50 a day for nine hours' work, with only part time Saturday. The Progressive Stonecutters' Association, to which most of the journeymen belong, allows four apprentices to a yard. "There are a good many more than that who apply to be admitted as apprentices," said a cutter in a Twenty-second Street yard, "I have often seen mothers bring their boys to the office and ask to have them taken in, but they have to be refused. 'The rough thing about it is that a lot of foreign masons come over here in the summer season for work and attempt to boss us Americans. It is a good deal like a tenant trying to boss his landlord. They belong to the association and undertake to tell us when we shall work and what we shall receive. It's pretty cheeky, and we think that it is about time we Americans were protecting ourselves. We throw open everything for them and don't get anything in return. They don't treat us so well in Canada. When I went to St. John's a few years ago they made me pay a working tax just for the sake of following my trade in the town.' The bricklayers have a protective association that is one of the strongest labor organizations in the country. They regulate the number of apprentices that a master may have, allowing him as many as they think he can properly instruct. The bricklayers have effectually prevented the influx of foreign workmen during the busy season, and aim to have all their members citizens of

the country. The carpenters are split up into a variety of organizations, and have no system of apprenticeship. Large numbers of carpenters come over every year from Europe, and the native element in the trade has been gradually decreasing. The painters are also without any system of teaching boys their trade, and thus making openings for well equipped foreigners of their craft who come to this country. In other trades the condition of things is probably not greatly different. From these few instances it will be apparent that the census of 1890 may not be so flattering to Philadelphia as was that of 1880, and that the American boy has not been having much of a chance during the last few years.

THEISM.

SOME OF THE EVIL CONSEQUENCES OF THE CUP THAT CHEERS WITHOUT INEBRIATING.

It is not a little curious that the diseases arising from the wrong uses of tea should be met with in greater frequency in countries foreign to its growth, asserts the London *Lancet*. The diseases due to tea are well known to doctors, but the public seem to be strangely indifferent to the teachings of their medical advisers in these matters. Recently, in France, M. Eloy has reminded medical men how vast is the number of diseases owing an allegiance to the dominion of Queen Tea. America and England are the two countries that are afflicted most with maladies arising from the excessive consumption of tea. Individuals may suffer in a variety of ways. It is customary to speak of acute, subacute and chronic "theism"—a form that has no connection with theological matters. The predominance of nervous symptoms is a characteristic of theism; general excitation of the functions of the nervous system may be observed; or the weakness may be noted more especially in the brain as distinguished from the spinal cord. Perversion of the sense of hearing is not at all an uncommon symptom—patients hearing voices that have no real or objective existence. The irritability that overtakes women so frequently may sometimes be clearly traced to an excessive indulgence in afternoon tea. There is hardly a morbid symptom which may not be traceable to tea as its cause.

BONNETS AND PIETY.

A MINISTER'S TESTIMONY AS TO HOW WOMEN'S ADORNMENT INTERFERES WITH CHURCH WORSHIP.

The Rev. Chas. F. Deems in a letter to the *Mail and Express* gives an eloquent description of how the proximity of a fashionable bonnet diverted his attention at church from the sermon of an eminent minister.

It was John the Baptist's Day in the city of St. Louis. I had been doing several days' work in Kansas and was on my way back to my New York parish. In eight years I had but one Sunday of vacation, in view of which I concluded to make this particular Sunday my Sabbath for the week. So I betook me to St. George's Church for worship, and entered the house of prayer with most devout intent. Several things have been told me which my constant devotion to the pulpit had kept me from verifying. One of these was that it would do a pastor good to put himself in the place of the pew-holder and study the whole subject from the standpoint of the hearer and worshipper. Men had told me that. Women had told me that female dress had been a great obstruction to their piety, in that it attracted their attention from worship in the church and had sent them home with uncomfortable feelings. I had been able to see the reason in what the men said more than in what the women said, largely perhaps because I am not a woman. But I am human. And this was my day. The morning prayer was very helpful and got through without any serious difficulty, perhaps because the reading desk was on my left and my eyes

were directed that way when lifted from my prayer book. It is now recollected that there was something pretty, or otherwise pleasant, more nearly in front of me. What it was that came into full play when I adjusted myself in the corner of my pew to listen to the sermon about to be delivered by my friend, the rector. Precisely in a line between him and me was a bonnet—perhaps the ladies would call it a "hat"—I am not learned in this branch of knowledge, being, in fact, the standing amusement of the ladies of my domestic circle for my absurd and ridiculous ignorance of feminine gear. Hat or bonnet, it was a beauty. Would that I had sufficient mastery of the *technique* of millinery to make my readers take in all the details which were combined in the creation of this capital piece of ornament. Instead of such analytic description I must content myself with the unsatisfactory synthetic exclamation, "Oh, but it was a beauty!" In general I may venture to say that the groundwork was black and soft and lacey. On that reposed, to that clung, or from that swung, a bunch of leaves and flowers, the differences and the contrasts and the harmonies of the colors and forms and combinations of which produced a most agreeable impression. My eyes ran just over the top of that bonnet to reach the preacher's face, and if they fell just one degree lower than that intellectual face they fell on that beautiful bonnet and—why should I not be honest?—gladly rested there. How many trains of thoughts ran through my head. I began to call up the different kinds of bonnets I had seen and the faces I had seen below them. While I could not recollect a single case of a lovely face below a bad bonnet, I recalled some great disappointments, a notable one in Paris, in the days of my younger manhood, in the days of Empress Eugenie's loveliness and bonnets, when I made quite a little run to get in front of a carriage in which I had seen such a "love of a bonnet" only to be punished by beholding a dark, ugly, disagreeable, sinister female face. Oh, much of that unedifying kind of thought ran through my head, while I was trying to hold tight to the thread of my friend's discourse on the rough, the lonely, the uncompromising, the un-Jerusalem preacher at the Jordan, while my eyes would drop to rest on that beautiful bank of flowers. Then I found myself wondering whether this specially attractive combination of beauties had been made by the stately head who wore it, or whether it was the result of the laborious ingenuity of a New York *modiste* whom I know, or whether it had been imported from Paris or Vienna. It was in the midst of these conjectures that I was recalled to a sense of my condition by the emphatic declaration of the preacher that John the Baptist stood in the loneliness of high integrity unaffected by the opinions of men or those sentiments of society which demand that when we are at Rome we shall do as the Romans do, and, in the language of the rector, "If we should have occasion to pass through hell, we should do as the devils do, at least while making the transit." This naturally lifted me from speculations suggested by the sight of the beautiful bonnet. Some preachers have a way of closing their sermons with what they call an "improvement." I have a desire to "improve," this bonnet incident. Upon going out of church I found in myself neither admiration nor dislike of the lady who wore the bonnet. Indeed, I did not see enough of her face to form any opinion of her. But there was a set of stubborn facts. I am not a woman; I am only a man. I am not young; indeed, I have no child that is not probably older than the lady with the beautiful bonnet. My studies have not been largely in the department of aesthetics; they have been in science, physical and metaphysical. And yet a Christian minister, who is suspected of being on the edge of old age, who had reached the city very weary from the delivery of a course of lectures to a body of clergymen on "The Ministerial Life," who was longing for the quite of the sanctuary, who had heard but two sermons in twelve months and was hungry for the Word, and who had come from his hotel to hear this.

particular clergyman preach because he had had long regard for him and interest in him—such a hearer has his worship broken by a thing not bad, not ugly, not disagreeable. Suppose I had been a woman and had my bonnet on. Could I possibly have refrained from wondering whether my bonnet was as beautiful as that other bonnet? I do not see how I could possibly imagine it was *more* beautiful. Suppose it had been as beautiful. Then I was only on a par with another lady. But oh! and alas! there would have been a great probability that mine was not as handsome as hers! Perhaps the people in the rear, some old parson from New York, for instance, might have been making disparaging contrasts. How could I endure that? You see, in the present state of fashion, it is the worshipper in the rear who has to meet the whole thing, those in front see nothing of it. The woman in the last pew cannot harm the congregation. The preacher sees no hats or bonnets, except such as are built on the architectural design of the Tower of Babel, or laid out and planted like the Hanging Gardens of Babylon. Men do not wear any clothing calculated to attract attention; it is the women. If reform comes it must come from women. Will it? Where are those "Daughters of the King" of whom we hear? Can they do nothing? Will they not try? I talked it over with some ladies of the St. George's congregation. Any suggestion from a man might probably peril the reform. Cannot Christian women seek and obtain from God such a consecration of their æsthetic talents and culture as will enable them to devise some cure of an evil which is so great as to retard the preaching of the Word of God? Plainly it must be the adoption of such a dress as will not call attention to the individual wearer and will not be grotesque or offensive to the beholders. All that is required is that it be tasteful and uniform.

HOW TO EAT BANANAS.

HINTS FROM THE TROPICS ON THE PROPER DISPOSITION OF A LUSCIOUS FRUIT.

Ordinarily in this country bananas are eaten raw, but in tropical countries, while the natives eat them in like fashion, a more delicate and, it is said, a more healthy mode of eating them is in vogue. The soft, ripe fruit, beaten to a cream with a sufficiency of Amontillado sherry, forms a delightful appetizer, and is the favorite way of eating the banana in certain parts of the West Indies and of the African coast. Taken in moderation at first rising in the morning, bananas are said to be preservative of health, and in this respect are in marked contrast with other tropical fruits, which are detrimental, rather than otherwise, to continued good health. An intoxicating drink is made from the banana, and on account of its astringent qualities is of considerable medical value. In Africa, and probably in other places also, the banana and the kindred tree, the plantain, are, in a very large measure, the sole dependence for the food supply of the natives. The banana, when ripe, contains 74 per cent. water; of the 26 remaining parts 20 are sugar and two gluten or flesh-forming substance. It is not in itself a perfect food, but requires the addition of some other nitrogenous material, as lean meat. The pulp of the banana, but more often of the plantain, is oftentimes squeezed through a sieve and formed into loaves, which, when ripe, will keep a very long time. In the dried state it has a resemblance of bread both in taste and composition, but the ripened pulp is saccharine, and not farinaceous. At Panama the rarest and most delicious of the banana species has its home. Small and ruddy in color, it is popularly known as the thumb banana, and on account of its delicate flavor is much prized even there. It does not bear transportation well, although it may often be found in the markets of Chicago and New York. Crossing the Isthmus by the line that connects Panama with Aspinwall, the natives of the villages along the route make a habit of coming to

the train, decked in primitive fashion, with garlands of flowers around their necks and flowers in their hair, and disposing of the fruit. Here the thumb banana may be eaten in its perfection.

COLDS AND CLOTHES.

INJURIOUS CONSEQUENCES OF WEARING TOO HEAVY CLOTHING.

The teaching of modern science and of ancient custom goes to show that heat-production within the body has much to do with the tissue-changes concerned in muscular activity and with healthy digestion. It is conserved by warm and moderate, wasted in evaporation by excessive, clothing. Finally, by a simple nervous reaction, it is increased after the contact of external cold. It follows from these observations that, if we be so clad with comfortable underclothing that surface perspiration is not formed in excess and is rapidly removed, one great cause of chill—sudden evaporation—is done away with. Outer cold, then, provided it is not too severe, only touches, as it were, the spring of the heat-making metabolism, and, exciting an elastic rebound in the chain of vaso-motor fibres, awakens that oxidative action by which every tissue is made to yield its share of heat to the body. This bracing influence is lost wholly or partly to those who are too heavily clothed, and in its place we may have a dangerous excess of surface heat. It is for this reason that we protest against the indiscriminate use of the thick and heavy overcoat. We would rather see men in fairly robust condition, especially if young, clad warmly next the skin, and wearing either a light top-coat or none at all. There can be no doubt that the habitual use of great-coats is indirectly accountable for the chills which they are intended to prevent. Were the overcoat worn continually it might attain its object. Its intermittent use, even when ample underclothing is worn, affords no solid guarantee of safety, but rather the reverse. The man of sedentary habits has especial need to remember this. He emerges daily from a warm breakfast-room clothed in his ordinary winter garments, with probably woolen underwear, and over all the heavy ulster or top-coat. After a short walk he finds that the sense of warmth he began with is more than maintained. He arrives at his office or place of business, and off goes the overcoat, though the air of the newly-opened room is as cold as that without, and draughty in addition. During the day perhaps he travels to and from adjacent business houses wearing only his house-clothing. The overcoat is laid aside till closing time reminds him of the journey home. The frequent result is that somehow between the hours of his departure and return he is chilled. No doubt he would run as great a risk if, lightly clad, he were to face the rigor of a winter day. In this case, however, exercise and habit might do much to develop the power of endurance, and there would, at all events, be less danger of sudden cold acting upon a freely perspiring surface. Woolen underclothing represents a state of healthy comfort intermediate between these extremes, and more resistant to chill than either. In commending its use, however, we do not assert that the influence of age and constitution is to be overlooked. Youth can oppose a power of resistance to depressing agencies which does not reside in the worn-out nerve-centres of a riper age. Similarly, that elastic reaction which characterizes the nervous and sanguine types is not to be looked for in the lax tissues of the lymphatic. The weaker physique naturally calls for fuller protection than the stronger; and any rule requiring the disuse of the overcoat should allow of reasonable exceptions in favor of the old and constitutionally feeble. Unusual severity of weather, especially if associated with night air and the loss of sleep which this implies, is another condition which might well constitute an exception. In such a case we are compelled to add some form of overcoat to the ordinary amount of

clothing. Some parts of the body—for example, the chest, throat and feet—are certainly more susceptible to cold than others. As a useful safeguard, cold or tepid bathing of such parts is in merited favor. The custom so common with many persons, especially women, of walking out in thin-soled boots, often plays an important part in catching cold. The progress of time and of rational thought may be expected to bring a more comfortable arrangement by clothing the foot with woolen hosiery and a stouter boot.

ADULTERATION IN NEW JERSEY.

PROPOSED AMENDMENT TO THE FOOD ADULTERATION LAWS.

The following draft of an amendment to the laws governing the sales of food products in the State of New Jersey, prepared by a committee of the State Association of Retail Merchants, has been submitted to the New Jersey Legislature. It has received the approval of State Dairy Commissioner Newton and no doubt will become a law. The adoption of the amendment will secure to the retail grocery trade immunity from prosecution when innocent of intent to deceive or defraud, which the law has hitherto denied.

1. *BE IT ENACTED by the Senate and General Assembly of the State of New Jersey*, That any person accused, before any court, of selling or offering for sale any article adulterated within the meaning of an act entitled "An Act to prevent the adulteration of food or drugs," approved March 25, 1881, and the supplements thereto, or an act entitled "An act to prevent the adulteration and to regulate the sale of milk," approved March 14, 1882, and the supplements thereto, who shall prove that he procured such article under a warranty, in the form hereinafter set forth, that said article was pure and unadulterated within the meaning of said acts, said person shall be discharged from prosecution; provided, that such proof in defence shall be filed in court prior to the trial of such case and a copy thereof left with the attorney for the prosecutor of the case.

2. *And be it enacted*, That no warranty shall be considered as within the meaning of this act unless in the form hereinafter given, and unless the article or articles warranted shall be specifically named and described in the body of said warranty; and no warranty shall be a defence if the person offering it shall have been notified prior to the sale complained of, that the articles mentioned in said warranty, are adulterated within the meaning of said acts.

3. *And be it enacted*, That any person uttering or giving a false warranty or swearing falsely in relation thereto shall be guilty of a misdemeanor, and on conviction thereof shall be punished by a fine of not more than five hundred dollars or imprisonment at hard labor for not more than one year, at the discretion of the court.

4. *And be it enacted*, That the warranty herein provided for shall be in the following form, to-wit:

WARRANTY.

It is hereby warranted that the following described article or articles—are pure and unadulterated within the meaning of the acts of the Legislature of the State of New Jersey regulating the sale of food, milk or drugs.

Signature, _____

Dated at _____, this _____ day of _____, A.D. _____.

5. *And be it enacted*, That this act shall take effect immediately.

EYE PHOTOGRAPHY.—Faiese Greene, a British photographer, has actually produced a picture with only the light issuing from his eye. Having stared for fifteen seconds at a 3,000 candle electric arc only three feet away, he closed his eye and quickly brought it over a sensitive plate at a distance of one inch. The result was a very faint but distinct image of the arc and the carbon, due probably to a momentary phosphorescence of the retina. A second attempt failed, and gas lights proved too weak to produce an effect.

KEEPING TIME.

EASY METHOD BY WHICH A WATCH CAN BE REGULATED.

A simple method of keeping correct time, where access to standard time is inconvenient, is thus explained by the *Locomotive*: "Select two fixed points for a range of observation. If a westerly window can be chosen, which faces any building anywhere more than twenty-five to thirty feet distant, we have as good a post of observation as we can desire. Drive a nail or stick a pin into the window jamb; or, if anything more substantial is wanted, fix a thin piece of metal with a very small hole in it to sight through, in any convenient place, so that you can observe the time any star sets or sinks below the roof of the adjacent building, or whatever may be chosen as the more remote sight. Then choose some well-defined star, the brighter the better, and with your timepiece set right (to start with), observe the time it passes the range of your sight. The exact time, as well also as the date of the observation, should be recorded; then, to find out at any subsequent time how much your watch has varied from correct time, observe the same star, and recollect that it sets just 3 minutes and 55.90944 seconds earlier on any given night than it did the preceding night. Thus, if our first observation was taken some night when the star set at 9 hours, 15 minutes and 23 seconds, and at our second observation, taken just one week later, it set at 8 hours, 47 minutes and 52 seconds, we would know that our watch had kept correct time. If it had set at 8 hours, 45 minutes and 52 seconds, we would know that our watch or clock had lost two minutes during the week. And similarly for any other variation. If the time at which it had set had been 8 hours, 49 minutes and 52 seconds, we should see that our watch had gained two minutes, and so on. If the location of our sights admits of it, we should select a star ninety degrees, as nearly as possible, from the pole star, for its apparent motion will be greater than that of one near the pole, and the liability of error will be diminished. If a suitable selection can be made the error need not be more than three or four seconds, and it will not be accumulative."

LOCAL BEEF INSPECTION.

AN ABLE EXPOSITION OF THE ILLEGALITY OF THE MEASURE.

(From the *Minneapolis Commercial Bulletin*, March 30.)

Those of our readers who read the editorial on "Inspection 'on the Hoof,'" which appeared in these columns a fortnight ago, will remember that at its close we endorsed the bill now before our State legislature in the following qualifying terms:

Hostility to absolute monopoly of any kind is one of the fundamental principles by which the *Bulletin* is conducted. The disadvantages of such monopoly in the long run will more than counterbalance present gains. We think it of the highest importance to the preservation of American institutions that opportunity for competition be always freely secured for our citizens. It is inevitable that a monopoly once firmly established shall become a tyranny. We are, therefore, always ready to give a new venture an opportunity for trial, provided that it promises to do its work well. We should be opposed to opening up petty slaughtering houses again all over the country, but we certainly should favor any legislation that would establish in many localities public abattoirs doing as good work as those of the "Big Four." If "inspection on the hoof" will enable the large slaughtering houses at the St. Paul and Minneapolis stock yards and at other points in the State to prosper, we are in favor of it. We favor the proposed law, however, only on the grounds that it would aid in checking the enormous aggressions of the "Big Four" combine. This growing power should be weakened and local prosperity should be increased, and therefore we say, let such measures as will accomplish these ends be put into operation.

Further reflection, however, leads us to acknowledge, without any lessening of our opposition to the numerous steadily growing monopolizing efforts now being made

in our country, that some fundamental principles upon which the government of the United States is established must not be lost sight of in the discussion of this question so important to local welfare. In the union of these States unquestionably the commonwealths made their compact with one another "for better or for worse." They engaged with one another to accept a common prosperity or adversity, to rise or to fall together. As against any alien State or people they reserved for themselves liberty to restrict or to throw open their commercial intercourse. In relation to the outside world, they can have free trade, establish a limited intercourse or no intercourse at all. Not so with one another. With one another they are as one people, among whom no bars to free intercourse may be erected. No import duty upon Louisiana's sugars by the Commonwealth of Minnesota may be levied; no tax on Wisconsin's lumber can be assessed by Illinois; no tax can be laid in New York upon the flour made in Minneapolis. Free trade is an inter-State right and duty. Legally, therefore, there is no protective measure possible between our own State and that of Kansas or Nebraska upon the meat prepared in the latter places for our markets. The Kansas slaughtering firms have an inalienable right to offer their wares for sale in any community in the United States, dislike the trade who will, be it crippling or not to local traders. In the present agitation, therefore, this fundamental principle of our federal Union must not be lost sight of or violated. The desirability of the development of local interests and industries, however, remains, and the radically pernicious effects of the growth of great monopolies like that of the Chicago "Big Four" meat combine should in some way, if possible, be counteracted. There seems in fact to be but one legitimate, constitutional way by which to meet these needs. If it can be clearly proven that the meat supplied to our markets by other communities is not fit for food, then the right belongs to our people to protect themselves against the deleterious stuff, not as one State against another, but as one people against other people, be they individuals, firms or communities, who are the instruments who do them harm. A State can legislate against the introduction of poisons or of diseases into its cities and households, no matter whence they may come, from within or without its borders. A State can require the inspection within its limits of all things offered there for food. It can refuse to allow the sale there of any thing which investigation proves to be harmful to purchasers. Upon this ground only can "dressed beef" be denied a place in our markets, whatever the locality in the country from which it may be sent. Now if it can be made clear that the beef slaughtering industry of Illinois, Kansas and Nebraska is so conducted that diseased meats are sent out by it to our market, the bill now before our legislature can legitimately become a law, otherwise not. Upon this question only hangs the right of Minnesota to endorse the present agitation in favor of "inspection on the hoof." Our desire and need to build up a local slaughtering industry may be very pressing; our hostility to the aggressiveness of the great "combine" may be well justified, but unless we are justified by sanitary requirements, our adoption of the proposed legislation would certainly be an attempt to violate a fundamental principle by which these States have become a nation. Without this justification it seems clear that the natural course of trade must have its way. Minnesota must be content to try to build up its cattle and slaughtering industries by means of the natural laws of trade, and failing in that, it must, however unpleasant the necessity may be, accept the sway of those who have the capital, skill and opportunity to command the natural channels of production and commerce.

FLYING-FISH.

THE ANATOMICAL ARRANGEMENT WHICH GIVES THEM THE APPEARANCE OF FLYING.

At a meeting of the Physiological Society, Berlin, Feb. 1, Professor Moebius spoke on the movements of the flying-fish through the air. He first described, from personal observation, the way in which the fish shoot out of the water from both bows of the ship, and then propel themselves horizontally for a distance of several ship's-lengths with their pectoral and abdominal fins stretched out flat, skimming along without moving their fins, always in the direction of the wind, but either with or against the same. When they meet the crest of a wave, they raise themselves slightly in the air, falling again to the same extent in the succeeding trough of the sea. Occasionally a slight buzzing of the fins may be observed, similar to that of the movements

of the wings in many insects. At night they frequently fall on the deck of the ship. As the result of a detailed investigation, the speaker had proved that these fish do not fly, since the anatomical arrangements of their fins and muscles are not adapted to this purpose. What really occurs is, that, when frightened by the approach of a ship or any enemy, they shoot out of the water, as do so many other fish, and are then carried along by the wind, which strikes on the under surface of their outstretched and evenly balanced fins. Notwithstanding the general acceptance which was accorded to the above investigation, it was urged by many that the buzzing of the fins, the rising over the crest of a wave, and the falling overboard after having landed on the deck of a ship, were evidences that this fish really executes movements which result in flight. In reply to this, Professor Moebius pointed out that the buzzing of the fins takes place when a strong current of air is directed against the outspread fins of a dead flying-fish by means of a bellows, and, further, that the rising over the crest of a wave or the bulwarks of a ship may be explained by the ascending currents of air which are always produced whenever a strong horizontal wind strikes against any elevated object such as a wave or part of a ship. Thus, finally, with the exception of the movements involved in its oblique sudden exit from the sea, all the motions of a flying-fish when in the air are really passive.

NOVELTIES OF THE SEASON.

SOME NEAT THINGS FOR THE DESK OR CENTRE TABLE.

The following particulars of some handsome articles of home use and ornamentation, which the enterprising manufacturers of New York have introduced this season, are gathered from a recent issue of *Geyer's Stationer*:

A handsomely engraved silver case, opening at one side, is intended for car and bridge tickets.

Just a roseleaf in oxidized silver, nothing more, with the centre cut so that it can be slipped over the edge of a leaf as a book-mark.

An oxidized Mephistopheles, diabolical and leering, lies prone on his face grasping within his extended arms the cylinder of a roller blotting pad.

A sombrero hat, in wood carving, is laid upon its brim. Through the crown a mischievous kitten thrusts its head and paws. Lift up Miss Fuss and an ink well is disclosed.

Of tally cards there is no end. A torchon board with softly shaded border, with fishing-rod and bait-basket in silver embossing, is for scoring the game of progressive angling.

A partly-stripped ear of corn, exquisitely carved, forms a pretty ink set. The upper part of the ear opens on a hinge, disclosing two ink-bottles, while the loosened, curling husk forms the pen tray. Two fluttering owls are lightly poised on the lid.

A convenient little trifle is a combined book-mark and paper-cutter in oxidized silver. The knife represents a curling lily leaf with flower cluster at the base. At the point where the cluster overlaps the knife it is loose and may be slipped over the edge of a leaf, thus making a book-mark.

A cylinder about eight inches in length, of pure, polished ivory, has a quaintly carved dog's head at one end, upon removing which ivory-handled pen, pencil, paper-cutter and eraser are disclosed.

A perpetual calendar is a little Swiss chalet of beautifully grained boxwood, all over which trail flowering vines with birds among the foliage. The colors are laid on under the polish and are exquisitely blended and soft in tone.

A pretty case or bag for playing-cards is made of chamois skin, ornamented with applique work designed to indicate the use of the bag. The lower end is fringed, and the mouth drawn together with bright-colored ribbons.

A dainty little stamp box, for pocket use, is of box-wood with a carrier pigeon in flight on the cover. The peculiar color and metallic hues of the plumage are beautifully brought out, and, tiny as it is, it is a gem of art.

A tally sheet for drive whist shows fanciful outlines of clouds, with playing-cards flying about like snow-flakes, through which Diomedes' horses are rushing at breakneck speed. On the back is a table for the scoring.

Round, graduated leaves of chamois skin, with a loose rosette of ribbon loops, held in place by an oxidized silver owl's head, holding in its beak a quill pen, makes a pretty and ornamental pen-wiper.

Some lovely menu cards are of vegetable parchment, a semi-translucent paper resembling rice paper, but heavier and firmer. The decorations are hand-painted flowers, rustic scenes and marines. One shows a lighthouse on a rocky, wave-washed beach. The lantern is a sparkling little Rhine stone.

DOMESTIC DIETETICS.

SPECIALLY PREPARED, FROM PRACTICAL TESTS, FOR THE LADY READERS OF THE "AMERICAN ANALYST."

SEASONABLE FOOD.

April.

MEATS.—Beef, lamb, mutton, ham, kidneys, liver, sausage, veal.

GAME AND POULTRY.—Brant pigeon, chicken, duck, turkey, goose, snipe.

FISH.—Anchovy, bass, cod, snipe, eels, carp, catfish, flounder, halibut, herring, lobster, mackerel, mussels, oysters, perch, rock-fish, salmon, smelt, whitefish, trout, sturgeon.

VEGETABLES.—Artichokes, beans, carrots, celery, garlic, lettuce, onions, parsley, parsnips, potatoes, shallots, spinach, turnips, water cress, radish, rhubarb, sea kale.

PRACTICAL RECIPES.

POTATO SOUP.—One gallon water, six large potatoes, one teacupful rice, a lump of butter the size of an egg, one tablespoonful flour, one cup of cream. Chop the potatoes fine; put them in the water with the rice; boil an hour; work butter and flour together; add to soup; boil up well and add cream just before serving. If liked, a small chopped onion may be added and a little chopped parsley.

TOAD-IN-THE-HOLE.—Make a batter as for cakes, with one pint flour and one egg and salt; grease a dish with butter; put lamb chops in it; add a little water, with pepper and salt; pour batter over it, and bake an hour.

OYSTER FRITTERS.—Remove the beards and put each oyster into a tablespoon, and fill with a batter made as follows: One ounce rice flour mixed with two tablespoonfuls of water, one teaspoonful of vinegar, two of salad oil, the yolk of an egg, and a little salt and pepper. Allow the batter to stand, and just before using beat the white of an egg to a stiff froth and mix with it. Fry the oyster covered with the batter in boiling fat, then place it on blotting paper to drain. Serve on a hot dish, and garnish with slices of lemon and thin rolls of brown bread and butter alternately.

BREAKFAST PUFFS.—Sift half a pint of flour, a salt-spoonful of salt and a teaspoonful of Horsford's baking powder together; stir into it gradually a gill of milk. Beat up separately the yolk and white of one egg; add the yolk to a gill of milk, stir this into the flour; now add the white of egg previously whipped to a foam, pour into individual tins and bake in a quick oven.

WATER CRESS SALAD.—Pick the cresses over carefully, removing bruised and imperfect ones. Mince a young onion, mix it with the cresses, and pour over them a plain dressing.

PLAIN DRESSING.—To one part vinegar put four parts oil, pepper and salt.

CHEESE CAKE.—Mix a quarter of a pound of grated cheese, one after-dinner cupful of milk, a little red pepper, nutmeg, salt and parsley; to this add three beaten eggs. Grease then the baking tin and bake the compound ten minutes in a hot oven. This is a very nice dish for either breakfast or supper.

THE DEADLY CIGARETTE.

SOME PRACTICAL SUGGESTIONS OF THE HARMFUL ABOMINATION.

DONE TO DEATH.

The coroner's inquest in Philadelphia into the cause of the death of Lewis R. Robinson, aged fifteen, brought out the fact that it was due to excessive cigarette smoking.

PROBABLY WORSE.

A leading New York physician of wide experience states as his opinion that "as matters are going now, cigarette making rivals the liquor trade in its pernicious influence upon the rising generation."

AN APPROPRIATE PREMIUM.

Cigarette smokers will be interested in the report, not yet confirmed, however, that a certain manufacturer of cigarettes offers a nice cemetery lot to every one who smokes twelve dozen packages of his cigarettes. Probably he wants to make the punishment fit the crime.

THE LATEST DEVICE.

The most recent adaptation of the automatic machine scheme to barber shop and ferry house use bears the label: "Put in a cigarette and take out a gaping idiot."

THE GOVERNMENT AND ADULTERATION.

A THOROUGH INVESTIGATION TO BE MADE.

The Department of Agriculture has entered upon a systematic investigation of the food adulteration question, which it is to be hoped will be maintained until the good work which it contemplates shall have been set further in the way of execution than has ever yet been accomplished. A corps of special agents has been organized, probably small in number, who have already begun to place themselves in communication with manufacturers of and dealers in food products all over the country, with a view to securing detailed information in relation to the prevalence and the manifestations of the adulteration evil. The following circular letter has been sent to the AMERICAN ANALYST by the Hon. J. M. Rusk, Secretary of Agriculture, Washington, D. C., as a sample of the plan of operations laid down for the use of the department's agents:

UNITED STATES DEPARTMENT OF AGRICULTURE.

DIVISION OF CHEMISTRY.

WASHINGTON, D. C., ... 1889.

Dear Sir: Having been appointed a special agent of this department to prepare "a report of a popular character on the extent of the adulterations of food supplies," I am anxious to learn from all reliable sources possible,

First—The extent of adulterations.

Second—The extent of adulterations injurious to health.

Third—The extent of sophisticated goods that are sold as pure.

I am anxious to present a report based upon facts, not conjecture, which will do no injustice to any person or trade, and at the same time show favor to none, and present a true statement of the condition of the matter treated; therefore I ask the various trades en-

gaged in the manufacture of food products to aid me with such data as they can furnish, so as to enable me to produce such a statement as will be of service to the commercial and agricultural interests of the country.

I enclose an addressed and franked envelope for reply. Trusting you will aid us as far as you can conveniently, I am,

Yours respectfully,

Special Agent.

Accompanying the above is a sheet bearing the following interrogatories, with spaces left for writing in the answers:

Please state your

NAME.....

ADDRESS.....

BUSINESS.....

To what extent, if any, does adulteration exist in your trade?

.....

State what adulterants are used?

.....

Are they, or any of them, injurious to health, and if so, which?

.....

What is the estimated adulteration in your trade; what percentage of reduction does it make in the cost of the articles?

.....

What is the relative reduction of the sophisticated articles to the retailer?

.....

And what is the reduction to the consumer?

.....

Are the adulterated articles branded true to name, or are they misbranded and sold as pure goods?

.....

Can you refer me to any positive evidence of adulterations or misbranding of food products in your own or other trades?

.....

Will you kindly give me any further information of a reliable character that will enable me to properly represent your trade in my report?

.....

To FUMIGATE A ROOM.—The simplest way to fumigate a room is to heat an iron shovel very hot and then pour vinegar upon it, drop by drop. The steam arising from this is a disinfectant. Doors or windows should be opened that it may escape.

GLASS-LINED TUBES.—Iron pipes lined with glass are reported to have withstood satisfactorily the severe test of having boiling water passed through them, followed immediately by water, at a temperature of thirty-three deg. Fahr. Subsequent examination showed no cracking or damage to the glass.

WILD SILK COCOONS.—L. G. Wilson, a resident of Jerauld County, Dakota, has made a discovery which, if successful, will be of vast importance to the farmers. He has found that the wild silk cocoons are strong and substantial, and that they can be carded. These cocoons are so numerous that they have to be taken off the trees and destroyed, and, while Mr. Wilson was at this work last spring, he stopped to examine one and found it to be made of strong material. He at once wrote to several silk-workers, and sent samples to one in France, who immediately sent an order for fifty pounds. From this amount the silk-worker will test the value of the cocoons and will report.

BUSINESS NOTES.

HORSFORD'S ACID PHOSPHATE

IN NERVOUS DEPRESSION.

Dr. F. W. Lytle, Lebanon, Ill., says: "I have personally used it with marked advantage, when overworked, and the nervous system much depressed."

A GOOD THING.

A patent has just been granted on an ingenious contrivance, made by Mr. Benjamin D. Milliken, of Somerville, Mass., for the purpose of mixing liquid and powdered substances, where the latter cannot be held in solution. This will be a great convenience to manufacturers of sauces, liquid polishes and the like, where a given quantity of each ingredient must enter every package. The machine is so constructed that an "agitator," revolving in the tank, keeps the contents in perpetual "boiling spring" motion, and at the same time straining the liquid. An additional device measures the quantity required for each bottle, filling the same at the rapid rate of 48 bottles per minute, or 200 gross a day. One of these machines has been in constant use since April of last year, at 140 Commercial St., Boston, where it can be seen by any one interested, pumping Parlor Pride Stove Enamel.—*Exchange.*

ARMOUR'S EXTRACT OF BEEF.

So much care being required in the manufacture of Extract of Beef, it is of the greatest importance to the consuming public that they should know by whom such an article is made, and that the manufacturers are thoroughly reputable and reliable. Armour & Co. bring to the work long experience as packers of every form of beef product. With the assistance of experts thoroughly practiced in the latest developments and discoveries of science as applied to the extraction and concentration of all that is nourishing, sustaining and

palatable in fresh beef of prime quality, they are able to produce an extract superior to anything of the kind previously offered to the public. It is admitted by all the most eminent authorities that Extract of Beef made from the coarse and practically wild cattle of South America cannot possibly equal in substance and flavor that produced from the well fattened and graded beeves of the United States. Chicago is pre-eminently the cattle market of the world; the facilities for obtaining plentiful supplies of raw material and for the selection of fine stock being far ahead of any other place on the globe. The name and reputation of Armour & Co. are widely and favorably known, and this brand on any of the great varieties of hog and beef products manufactured by them is uniformly accepted as a guarantee of quality and careful preparation. We can recommend this extract in the strongest terms as having been made only from the best material, with the most scrupulous care and cleanliness.

Armour's Extract of Beef will keep for any length of time, if, after opening the jar, the cork is replaced, or if the mouth of the jar is merely kept covered.

The extract is an invaluable addition to soups made with potatoes, peas, beans, barley, tomatoes, carrots, turnips, or other vegetables, doing away with all necessity for boiling fresh meat or bones with them.

Should bones and marrow be boiled with vegetables to produce a soup, then the addition of a small quantity of extract will increase the strength and very much improve the flavor.

The extract will be found very useful for making or strengthening meat sauces, gravies, etc., and if added to stews, roasts or ragouts, will be found to vastly improve the flavor.

The extract is free from all objectionable smell or flavor, retains more of the actual taste of the beef, and will go further than any other extract on the market.

BRITISH TRUSTS.—Great Britain reports a regular flood of so-called "trusts." During the year 1888 there were formed in that country, according to the London *Statist*, seventy registered trusts with an aggregate capital of \$350,000,000. The present year promises to be equally prolific of trusts, as January and February record the formation of thirteen trusts, with an aggregate capital amounting to \$43,750,000. American grumblers at American trusts will do well to study these figures.

DON'T LET CONSERVATISM, CUSTOM, OR PREJUDICE

prevent your enjoying the now well attested benefits of the

IDEAL FELT Tooth Polisher,

"IDEAL" IN

NAME, NATURE, RESULTS,

as slight familiarity will prove. Recommended by Prominent Dentists everywhere; among them Dr. T. B. Arnold, 127 W. 34th St., N. Y., writes "It has no equal for Polishing the Teeth and Hardening the Gums."

Examine its construction, ascertain its results, and you will use no other.

A Perfect Polisher.

Thorough Cleanser.

AT ALL DRUGGISTS.

Its Economy. Holder (imperishable) 35 cents. Polishers only need be renewed. 18 (boxed) 25 cents. Dealers or mail.

HORSEY MFG. CO., UTICA, N. Y.

ORIGIN OF THE DOG.—The question of the origin of the dog has recently been discussed by Professor Nehring, who believes that it has descended from various still surviving species of wolves and jackals. The latter animals can be tamed, and many attempts to domesticate wolves have been successfully made in recent times. Herr Ronge has so completely tamed a young wolf that he follows him exactly as a dog might do.

PROTECTION FROM MOTHS.—For the effectual protection of woollen goods against moths the use of cedar wood boxes and closets is insufficient, and it is stated that there is no other means of protection against the ravages of the insect but perfectly to inclose the woollens in material which is not attacked by the moth, such as cotton cloth. Woollen goods brushed clean from dust, folded together and put into cotton bags, which were well tied, have been found perfectly intact when taken out at the change of the season.

BUFFALO LITHIA WATER

In the Uric Acid Diathesis, Bright's Disease, Chronic Inflammation of the Bladder, etc.

JAMES L. CABELL, M. D., A. M., LL. D., Professor of Physiology and Surgery in the Medical Department in the University of Virginia, and President of the National Board of Health.

"The Water of Buffalo Spring No. 2 contains in notable quantities two of the ALKALIES which are accredited as extremely valuable in the treatment of GOUT, LITHIASIS, and Liver Affections. I refer to the CARBONATES of POTASH and LITHIA.

"I have recently read with interest a paper in 'The New York Medical Journal' on the Buffalo Lithia Water in Diseases of the NERVOUS SYSTEM, in which the writer, Dr. Boyland, citing his own observations and those of other eminent physicians, ascribes to this water a special virtue as a direct tonic for the NERVOUS SYSTEM in cases of CEREBRAL exhaustion. I have only had occasion to test its effects in this direction in cases in which the NERVOUS SYMPTOMS may have been due to LITHEMIC conditions. In these cases the relief following the use of the remedy was very decided."

Dr. WM. A. HAMMOND, of New York, Surgeon-General U. S. Army (retired), Professor of Diseases of the Mind and Nervous System in the University of New York, etc.

"I have for some time made use of the Buffalo Lithia Water in cases of affections of the NERVOUS SYSTEM, complicated with BRIGHT'S DISEASE OF THE KIDNEYS or with a GOUTY DIATHESIS. The results have been eminently satisfactory. Lithia has for many years been a favorite remedy with me in like cases, but the BUFFALO WATER CERTAINLY ACTS BETTER THAN ANY EXTEMPORANEOUS SOLUTION OF THE LITHIA SALTS, and is, moreover, better borne by the Stomach. I also often prescribe it in those cases of CEREBRAL HYPEREMIA resulting from over-mental work—in which the condition called NERVOUS DYSPEPSIA EXISTS—and generally with marked benefit."

Dr. ROBERT BATTEY, of Georgia, SUGGESTOR OF BATTEY'S OPERATION.

"I would state that I have been using the Buffalo Lithia Water, No. 2, in my practice for three years past, in cases of CHRONIC INFLAMMATION of the BLADDER, whether induced by STONE, by enlarged PROSTATE in the aged or by NEGLECTED GONORRHEA, AND HAVE SECURED EXCELLENT RESULTS, which encourages me to prescribe it for the future."

HUNTER MCGUIRE, M. D., LL. D., late Professor of Surgery, Medical College of Virginia, Richmond.

"BUFFALO LITHIA WATER, Spring No. 2, as an ALKALINE DIURETIC, is invaluable. In URIC ACID GRAVEL, and, indeed, in diseases generally dependent upon a URIC

ACID DIATHESIS, it is a remedy of extraordinary potency. I have prescribed it in cases of RHEUMATIC GOUT, which had resisted the ordinary remedies, with wonderfully good results. I have used it also in my own case, being a great sufferer from this malady, and have derived more benefit from it than from any other remedy."

Dr. WM. B. TOWLES, Professor of Anatomy and Materia Medica in the Medical Department of the University of Virginia.

"BUFFALO LITHIA WATER, No. 2, belongs to the ALKALINE or, perhaps, to the ALKALINE-SALINE Class, for it has proved far more efficacious in many diseased conditions than any of the simple ALKALINE waters.

"I feel no hesitancy whatever in saying that in GOUT, RHEUMATIC GOUT, RHEUMATISM, STONE in the BLADDER, and in all Diseases of URIC ACID DIATHESIS, I know of no remedy at all comparable to it.

"Its effects are marked in causing a disappearance of ALBUMEN from the urine. In a single case of BRIGHT'S DISEASE OF THE KIDNEYS I witnessed decided beneficial results from its use, and from its action in this case I should have great confidence in it as a remedy in certain stages of the disease."

Dr. THOMAS H. BUCKLER, of Paris (formerly of Baltimore), SUGGESTOR OF LITHIA as a Solvent for Uric Acid.

"Nothing I could say would add to the WELL-KNOWN REPUTATION OF THE BUFFALO LITHIA WATER. I HAVE FREQUENTLY USED IT WITH GOOD RESULTS IN URIC ACID DIATHESIS, RHEUMATISM, AND GOUT, and with this object I have ordered it to Europe, from Coleman & Rogers, of Baltimore. Lithia is in no form so valuable as where it exists in the Carbonate (the form in which it is found in the BUFFALO LITHIA WATER), Nature's mode of solution and division in water which has passed through Lepidolite and Spondumine Mineral formation."

Dr. GRAEME M. HAMMOND, of New York, Professor of Diseases of the Mind and Nervous System in the New York Post-Graduate Medical School and Hospital.

"In all cases of BRIGHT'S DISEASE of the KIDNEYS I have found BUFFALO LITHIA WATER of the greatest service in increasing the quantity of urine and in eliminating the ALBUMEN. In certain cases of Melancholia, accompanied by excessive eliminations of URATES and URIC ACID, it is often the only remedy necessary. In GOUT and RHEUMATISM it is highly beneficial, and in many cases of Impotence its restorative qualities have been of undoubted assistance. I have long regarded BUFFALO LITHIA WATER as the most valuable mineral water in use."

Water in cases of one dozen half-gallon bottles, \$5.00 per case at the Springs.

THOMAS F. GOODE, Proprietor, Buffalo Lithia Springs, Virginia.

Tablespoonful
of Pearline
to Pail of Water.

It is better than any soap; handier, finer, more effective, more of it, more for the money, and in the form of a powder for your convenience. Takes, as it were, the fabric in one hand, the dirt in the other, and lays them apart—comparatively speaking, washing with little work. As it saves the worst of the work, so it saves the worst of the wear. It isn't the use of clothes that makes them old before their time; it is rubbing and straining, getting the dirt out by main strength. For scrubbing, house-cleaning, washing dishes, windows and glassware, Pearline has no equal. Beware of imitations, prize packages and peddlers. Pearline is sold by all grocers. 138 James Pyle, New York.

Use

A BUSINESS BENEFIT.

ADVANTAGES TO ADVERTISERS OFFERED
BY THE AMERICAN ANALYST.

It has not the limitations of a daily paper. No one reads yesterday's paper. A monthly lives at least a month, while a semi-monthly is fresh twice a month, and its audience is not limited by geographical lines, but the circulation is all over the United States and Canada.

It contains matters of interest to everyone, especially the ladies of the household, and is, therefore, sure of a careful perusal. Our audiences are intelligent and of the better classes, who have money to spend, and any well worded advertisement in our columns, giving real information, will receive a careful perusal.

Our rates are as low as our circulation affords. Large circulation and original matter cost money, and those advertisers who desire to realize these benefits must expect to pay reasonably for them.

Advertisements in our columns are permanent. Most of our subscribers bind their numbers.

Our advertisements are set up in an attractive form, sure to call the attention of the reader.

Anything that our readers want, or for which a demand is to be created, not wholly of a local nature, will pay to advertise with us.

We take only advertisements from legitimate houses of really meritorious goods, and give them all the editorial assistance they deserve; consequently our readers knowing this, have confidence in advertisements contained in our columns.

The fact that we have the best and largest houses in every branch of trade advertising with us, and that they always renew as their seasons arrive, proves beyond a doubt that they have found the AMERICAN ANALYST a good advertising medium. Why should not you?

FOR THE THIRD TIME

in our history we have been forced to move into larger quarters to keep up with the demand from our New York, Worcester, Springfield, Providence, Lynn, New Haven, and two Boston stores, and our enormous mail trade. We now occupy two-thirds of an acre of space devoted entirely to custom-work, turning out more garments than any house in the United States. You can order by mail by our system as safely as if you could call at one of our stores. To obtain the famous Custom-made Plymouth Rock \$3 Pants, first, send 6 cents, for which we will mail you 20 sample self-measurement blanks, and linen tape measure. provided you mention this PAPER, or if you cannot wait for samples, tell us about the color preferred, with waist, inside leg, and hip measures, remit \$3, together with 35 cts. to cover cost of expressage or postage, and we will forward the goods prepaid to any address in the U. S., guaranteeing safe delivery and entire satisfaction or money refunded. Remember, also, that we make to your order, Full Suits, \$13.25. Overcoats, \$12.00, and that for any cause we refund money at buyer's request upon return of goods, or make alterations or new garments free of extra charge.

BRANCH OFFICES.—285 Broadway, New York; Burnside Building, Worcester, Mass.; Gilmore House, Springfield, Mass.; 60 Market St., Lynn, Mass.; Butler's Exchange, Providence, R. I.; Register Building, New Haven, Conn.

Any one wishing to learn of our responsibility, may write the American Express Co., at Boston, (capital \$20,000,000) or consult the commercial agencies.

MALTINE

MALTINE is far superior in nutritive and diastatic value to any Malt Extract manufactured in the World. There is no reconstructive that excels Maltine in Phthisis and many wasting Diseases.

MALTINE in its different forms is the only malt preparation we now employ, being so palatable, digestible, and easily assimilated. Of its efficiency in appropriate cases there is no more doubt in our minds than there is of the curative power of Quinine, Cod Liver Oil, the Bromides, and the Iodides. It deserves to stand in the front rank of constructive, and the constructive by their preventive, corrective, and curative power are probably the most widely useful therapeutical agents that we possess.

PROF. L. P. YANDELL.

MALTINE is a valuable food, a food of priceless value at times of emergency. In fact, in very grave gastric cases it is a food which may be often resorted to when at one's wit's end what to do.

J. MILNER FOTHERGILL.

Out of 14 trade samples of Malt Extract examined by Messrs. Dunstan & Dimmock, only three possessed the power of acting on starch. These brands were **MALTINE**, Corby, Stacey & Co.'s Extract, and Keppeler's Malt Extract.

WILLIAM ROBERTS, M.D., F.R.S.

I have subjected "Maltine" and all other leading "Extracts of Malt" to an exact quantitative comparison of their diastatic activity. The results demonstrate conclusively the far greater diastatic value of Maltine, and enable me to state, without any qualification whatever, that it far exceeds in diastatic power any of the six preparations of Malt which I have examined.

R. H. CRITTENDEN.

Professor of Physiological Chemistry in Yale College.

At the International Health Exhibition held in London, England, the only gold medal and the highest award of merit were given to Maltine by a Jury composed of the best chemists in Europe, and recent analyses made by the most reliable authorities in Europe and America prove conclusively that Maltine—in nutritive and diastatic value—is superior to all other malt preparations now in the market.

NOTE.—Physicians will observe that Maltine, as now prepared, is not so viscid as formerly made, being of a more fluid consistency; and, while retaining the nutritive and diastatic value which has given it precedence over all other Extracts of Malt, it is rendered entirely agreeable to the taste of the most fastidious, and is more easily administered. As now prepared, we positively guarantee that Maltine will not ferment or congeal in any climate or at any season of the year.

COMPLETE LIST OF MALTINE PREPARATIONS.

MALTINE (Plain). **MALTINE** with Phosphates, Iron Quinine, and Strychnia. **MALTINE** with Cod Liver Oil. **MALTINE** with Hypophosphites. **MALTINE** with Peptones. **MALTINE** with Peptin and Pancreatine. **MALTINE** with Cascara-Sagrada.

Physicians may obtain Maltine from all druggists in every part of the world. In cases where the physician intends to prescribe Maltine, the word "Maltine" should be written, and not simply the words "Malt Extract," or "Extract of Malt."

Send for Pamphlet giving comparative analyses by 100 of the best Analytical Chemists in this country and Europe.

We will be happy to supply any regular practitioner with eight ounces each of any three Maltine compounds that may be selected from our list, providing he will agree to pay express charges on same.

COLDEN'S
ORIGINAL LABEL:
"Colden's Liebig's Liquid Extract of Beef and Tonic Invigorator."
LIQUID
BEEF TONIC.

AN INVALUABLE AID IN THE TREATMENT OF
ALL CASES OF DEBILITY.

Established 15 Years. Endorsed by Scores of Physicians.

Essentially Different from all other Beef Tonics.

Beware of Imitations.

COLDEN'S LIQUID BEEF TONIC consists of the Extract of Beef (by Baron Liebig's process), spirit rendered non-injurious to the most delicate stomach by extraction of Fusel Oil, soluble Citrate of Iron, 1 inchona, Gentian and simple aromatics. An official analysis of this preparation by the eminent chemist ARTHUR HILL HASSALL, M. D., F. R. S., and an endorsement by SIR ERASMUS WILSON, F. R. S., is printed on the label of each bottle.

Its Range of Action Embraces all Cases of Debility.

By the urgent request of several eminent members of the medical profession, I have added to each wineglassful of this preparation two grains of SOLUBLE CITRATE OF IRON, and which is designated on the label as "No. 1," while the same preparation, without Iron, is designated on the label as "No. 2."

It acts directly on the sentient gastric nerves, stimulating the follicles to secretion and gives to weakened individuals that first pre-requisite to an improvement, an appetite.

I will, upon application, send a sample bottle of Colden's Liquid Beef Tonic to any physician in regular standing. Please ask your Dispensing Druggist (if he has not already a supply) to order it. In prescribing this preparation physicians should be particular to mention "COLDEN'S" viz: "EXT. CARNIS. FL. COMP. (COLDEN)." It is put up in pint bottles and can be had of Wholesale and Retail Druggists generally throughout the United States.

INTOXICATION BY RADIATION.

Several years ago, as a ferry boat was crossing the Elizabeth River from Portsmouth to Norfolk, a child fell overboard. One of the passengers, an artillery officer belonging to the garrison at Fort Monroe, jumped into the stream and rescued the little one, which was restored to its affrighted mother uninjured, with the exception of a ducking. It was late in the afternoon, and the generous rescuer was able to take passage at once on the Baltimore steamboat for Fort Monroe, on the opposite shore of Hampton Roads, as well as to dry himself in the engine room, while crossing. He was observed to be in a state of marked exhilaration, which increased throughout the passage, so that when he landed at the Old Point wharf, the bystanders were impressed with the opinion that he was considerably under the influence of strong liquor. His friends knew better, though they were greatly puzzled to account for his condition. As a matter of fact, the officer had long been, and continued throughout his life, a total abstainer from liquor in every shape, and what seemed to be

drunkenness on this occasion was in reality merely a singular manifestation of intense excitement. The case was strange, but not wholly without precedent. The subjoined paragraph from the last number of the *Popular Science Monthly* gives several illustrations of men falling into a seeming state of intoxication without having partaken of intoxicating drink. These instances, however, differ from the one related above, in the circumstance that the persons they refer to derived their excitement from proximity to convivial associates, while the artillery officer had come into contact with nothing except water, and that salt, and in excessive quantity.

"A prominent military man who had drunk moderately during the war and had abstained from that time on, while attending a dinner with his old comrades, where most of them were intoxicated, suddenly became hilarious, made a foolish speech, and settled back in his chair in a drunken state, and was finally taken home quite stupid. He had not drunk any spirits and had only used coffee and water, and yet he had all the symptoms of the others, only his was intoxication from contagion. The favoring soil had been prepared long ago in the army. Another case was that of a man who had been an inebriate years ago, but had reformed. He was recently elected to office, and gave a dinner to some friends. Among them was a physician who has been greatly interested in these studies. He sent me a long report, the substance of which was this: On the occasion referred to, many of the company became partially intoxicated, and the host, who drank nothing but water, became hilarious, and finally stupid with them. He was put to bed with every sign of intoxication, but recovered, and next morning had only a confused notion of these events. The third case occurred four years ago. A reformed man, of twelve years' sobriety, went on a military excursion with a drinking company, and, although he drank nothing but lemonade, became as much intoxicated as the others. This event was the subject of much comment and loss to him, socially and otherwise, although he protested, and others confirmed his statements, that he did not take any spirits at this time."

HARMFUL BEER.

In Germany it is a serious offence, and seriously punishable, for a brewer to offer his lager beer to the public until several months have elapsed after its brewing. Unfortunately, there is no such law in this country, and accordingly many brewers have greatly curtailed the time of keeping, and constantly seek for expedients and processes for cutting it down still more, so eager is the market, so uncritical the consumer. Indeed, the American beer drinker has little regard for his liver and kidneys, or he would have stoutly protested long ago. He takes his beer unsuspectingly and without inquiry, till a time comes when, the liver being affected, or the kidneys, or both, nature protests, and the beverage once so pleasing to his lips is like to so much acid. A chem-

ist, recently investigating this matter, says that brewers are using materials other than malted barley, such as corn and oats, etc., mixed with barley and hops, by which they accelerate its manufacture, making a sweetish, pleasing, heady beverage, but alcoholic, and people using this kind of beer in large daily quantities, with the idea that it is innocuous, has brought on a marked increase of renal complaints. This statement was shown to a medical inspector of the Board of Health of this city. He could not say if these particular ingredients were used, but the general charge, he said, was undoubtedly true, neither colored as to the intent of the brewers nor exaggerated as to the effect on the health of the consumer. The Health Department, he said, had not sufficient force to look into this matter just now, so full were its hands with the routine of inspection. If it can be shown the beer is injurious to health, the makers can be held and punished.

THE CIGARETTE CURSE.

An instructive paper was read before the San Francisco Medical Society a few weeks ago by Dr. George F. Shiels, on the uses and effects of tobacco. The habit is discussed exhaustively and yet with a remarkable absence of prejudice and much of the bitter antagonism that it encounters at the hands of a certain class of would-be social reformers is shown to be the outcome of misconception if not of infatuated ignorance. Dr. Shiels recognizes the tendency of writers with strongly preconceived ideas to allow themselves to be biased, and to attribute to tobacco effects that it rarely, if ever, produces. He declares that there is not sufficient evidence for stating that it is capable of causing such diseases as apoplexy, liver disease, or mania, though in connection with that last mentioned, it is possible to conceive that the prolonged excessive use of tobacco might in time be the cause of such change in the nerve cells, which might lead to mental derangement. Still, from its extreme rarity, we may practically exclude it from our consideration. Moreover, regarding the effect of tobacco on morals and religion, there is no evidence to show that, when used in moderation, it has any influence. To state that it leads to the demoralization of armies or nations, or that it is a factor in the production of crime, or of alcoholic intemperance, is to state that which is not founded on fact. This is all true enough, doubtless, in regard to the use of tobacco by adults, but when we turn our attention to the abomination of cigarette smoking and inhalation among the youth, the pale pasty, dwarfed appearance of hundreds of boys one sees in the streets of New York with pipe, cigar or cigarette in mouth, are enough in themselves to show that it is radically harmful to them. Were more proof wanting of this, the books we read and the reports of the cause of rejection of youthful candidates for the navy and training schools of the United States would supply it. Ten out of twenty candidates for cadetship at West Point were recently rejected on account of tobacco heart brought on by cigarette smoking. Unless

30 Shaves

for 2 Cents.

Send a two cent stamp to Colgate & Co. 55 John St., New York, who will mail you a sample of this superior soap sufficient to last a month,

some means are availed of for checking this disgusting and destructive juvenile habit, we run a risk of natural deterioration, physical, moral and intellectual. Our youth will be stunted and imbecile, and grow up to utter worthlessness and inefficiency.

OLEOMARGARINE STATISTICS.

The Internal Revenue authorities at Washington estimate the oleomargarine production for the current fiscal year at about 45,000,000 pounds, in comparison with 34,000,000 pounds last year, and making an aggregate of 100,000,000 pounds from the time the law went into effect, November 1st, 1886. During the eight months of the fiscal year 1887 the average monthly production was believed by the authorities to be on about the same scale as before the enactment of the law; during the fiscal year 1888 there was a decided increase, and thus far this year the increase has been still greater. The comparison of average monthly production during the eight months of 1887, during the year 1888, and during the eight months of the fiscal year 1889 has been as follows: 1887, 2,711,828 pounds; 1888, 2,860,460 pounds; 1889, 3,750,000 pounds. These figures show an increase of more than 1,000,000 pounds in average monthly production. The Government record is conclusive evidence of the steady increase in the amount of oleomargarine manufactured under Governmental supervision, and issued from the factories under brands and stamps. The extent of surreptitious manufacture and of the use of oleo oil as an adulterant of butter is a matter of speculation, but the public records clearly show that oleomargarine as a legitimate article of commerce is growing in popular favor, and that its consumption is steadily increasing.

SORGHUM SUGAR.

Prof. Wiley, chemist of the U. S. Agricultural Department, has completed his record of experiments in the manufacture of sugar from sorghum, conducted at Rio Grande, N. J.; Kinner, La., and Conway Springs, Douglass, and Sterling, Kansas. The work at Rio Grande, N. J., was carried on to determine whether or not sorghum sugar could be successfully manufactured on a small scale. Prof. Wiley says the result of the two years' trial at Rio Grande shows that all conditions combine to render the manufacture of the sugar on a small scale commercially successful. Prof. Wiley finds that Southern and Western Kansas possess the best soil and climate for sorghum raising so far as is now known. The conditions in Texas, Louisiana, Arkansas, Tennessee and North Carolina are probably equally favorable, but this remains to be demonstrated. The

Indian Territory, he thinks, is destined to be the centre of the industry. The hope of establishing a successful sorghum industry in the great maize fields of the country, he concludes, must now be definitely abandoned. The latest reports show that an average of 194 pounds of sugar is made from a ton of cane.

BLACK SNOW.

A phenomenon that has not yet been satisfactorily explained was witnessed on April 2d at Aitken, Minnesota. Shortly before five o'clock in the afternoon, it became so dark that lights were necessary in business houses, and the air was filled with snow that was as black and dirty as though it had been trampled into the earth. Six ounces of snow and one-fourth ounce of dirt and sand were found in the bottom of a dish. The dirt is very fine, something like emery, and contains particles that have a metallic lustre. This dirty snow fell to the depth of half an inch. The atmosphere at the time presented a peculiar greenish tinge. There was a little wind blowing at the time from the northwest, though there seemed to be considerable wind higher in the air. Solid chunks of ice and sand are reported to have been picked up in various places.

THE COMING STATES.

Some idea of the area of the four new States, Montana, Washington, North and South Dakota, may be gained when we state that it is three times as great as the four British islands, more than three times larger than Italy, more than 150,000 square miles in excess of Germany, and is about equal to the area of the following States: Maine, New Hampshire, Vermont, Massachusetts, Rhode Island, Connecticut, New York, New Jersey, Pennsylvania, Delaware, Maryland, Virginia, West Virginia, Ohio, Kentucky and Indiana combined.

PURE FOOD HUMBUGS.

A VIGOROUS ARRAIGNMENT OF THE "CHROME YALLER" ABSURDITIES.

The Philadelphia *Cash Grocer* makes the following very sensible and apparently much-needed suggestion, to wit: "The pure food people should take an interest in oleo and help along the poor man's substitute for creamery butter and relief from the axle grease variety." This is indeed so. While the pure food agitators, especially the Philadelphia set, are crying over the adulteration of the food of the masses and hysterically shouting "Chrome Yaller," and vigorously inveighing against refined lard and oleomargarine as examples of corrupted food, not a word is said against the use of poisonous acids and chemicals and artificial colors used by the axle grease manipulators, who brand and sell their dirty soap fat as "honest butter," meanwhile joining with the Chrome Yaller crowd in damning oleo. Consistency is an attribute apparently wholly unknown to the anti-oleo pure humbug agitators; for if they were really sincere and honest in their purpose they would quickly and vigorously war on axle grease butter, with a likelihood that if it was prosecuted with one-half the energy they expend on fancied food evils they would soon develop a really popular demand for reform and purity of food which would give it a prestige and power that would culminate in an honest law such as the pure food convention at Washington in 1888 finally recommended, in opposition to the intended one-sided anti-oleo law which the Philadelphia gang and their New York sympathizers hoped to procure under a false pure food clamor. If Chrome Yaller and his immediate sympathizers will cease working their selfish and personal schemes, and unselfishly devote themselves to an impar-

tial investigation and publicity of the dangerous evils and dishonest adulterations of the dairy, they will redeem themselves from a popular disbelief as to their real aims and purposes, and, what is more to their purpose, secure a larger share of public esteem and favor. Besides this, we personally can promise them more tangible practical support and backing than they have yet received or ever will receive. And as a parting suggestion we may add that if they do not soon add renovated and manipulated cow grease to their list of food articles requiring State regulation and inspection, their already fading chances for recognition will be but a memory.—*Prod. Ex. Bulletin.*

BREATHING.

THE QUANTITY OF AIR REQUIRED BY THE LUNGS.

The following anatomical and physiological memoranda will be of interest to our readers, and serve a useful purpose as a matter of reference: "In each respiration an adult inhales one pint of air. Man respire sixteen to twenty times a minute, or twenty thousand times a day; a child, twenty-five to thirty-five times a minute. While standing, the adult respiration is twenty-two; while lying, thirteen. The superficial surface of the lungs, *i. e.*, of their alveolar spaces, is two hundred square yards. The amount of air inspired in twenty-four hours is about ten thousand quarts. The amount of oxygen absorbed in twenty-four hours is five hundred litres (744 grams), and the amount of carbonic acid gas expired in the same time, four hundred litres (911.5 grams). Two-thirds of the oxygen absorbed in twenty-four hours is absorbed during the night hours from 6 P. M. to 6 A. M. Three-fifths of the total CO is thrown off in the day time. The pulmonary surface gives off one hundred and fifty grams of water daily in the state of vapor. An adult must have at least three hundred and sixty litres of air an hour. The heart sends through the lungs eight hundred quarts of blood hourly, and five thousand gallons daily. The duration of inspiration is five-twelfths, of expiration seven-twelfths, of the whole respiratory act. During sleep, inspiration occupies ten-twelfths of the respiratory period."

STARVING THE TEETH.

THE PROPER FOOD FOR BUILDING BONES AND TEETH.

Teeth are just as easily starved to death as the stomach. In one way it is a blessing to have been born of poor patients. What food the poor give their children is of the variety that goes to make strong bones and teeth. It is the outside of all the grains, of all cereal foods, that contains the carbonate and phosphate of lime and traces of other earthy salts which nourish the bony tissue and build the frame up. If we do not furnish to the teeth of the young that pabulum they require, they cannot possibly be built up. It is the outside of corn, oats, wheat, barley and the like, or the bran so-called, that we sift away and feed to the swine, that the teeth actually require for their proper nourishment. The wisdom of man has proven his folly, shown in every succeeding generation of teeth, which become more and more fragile and weak. These flouring mills are working destruction upon the teeth of every man, woman and child who partakes of their fine bolted flour. They sift out the carbonates and the phosphates of lime in order that they may provide that fine white flour which is proving a whitened sepulchre to teeth. Oatmeal is one of the best foods for supplying the teeth with nourishment. It makes the dentine, cementum and enamel strong, flint-like, and able to resist all forms of decay. If you have children, never allow any white bread upon your table. Bread made of whole wheat ground, not bolted, so that the bran which contains the minute quantities of lime is present, is the best. To

make a good, wholesome, nourishing bread, take two bowls of wheat meal and one bowl of white or bolted flour, and make by the usual process. Nothing is superior to brown bread for bone and tooth building. This is made out of rye meal and corn meal. Baked beans, too, have a considerable supply of these lime salts, and should be on your tables, hot or cold, at least three times a week. In brushing the teeth, always brush up and down from the gum instead of across. Brush away from the gum, and on the grinding surface of your teeth.

IMPOSSIBLE GOLD.

HOW THE PUBLIC IS GULLED BY NEWSPAPER FICTION.
MONGERS.

In the subjoined very interesting story, which we reprint from the *Mail and Express*, only one thing is wanting—truth, or even probability. Platinum is the hardest metal, and can only be melted by the oxyhydrogen blow-pipe. If any man were able to melt platinum in sufficient quantities to make such an alloy as is here described at a cost so low as to enable him to sell it at the price of gold, and make a profit, he need not resort to fraud. A handsome fortune awaits that man; but the writer of the paragraph quoted could improve his finances by a few stories of the Rider Haggard stamp:

A few days since, a prominent manufacturer of gold rings, Mr. Julius Wodiska, went to the office of a refiner on John Street to see about the refining of some "sweeps" from his factory. The refiner handed to him a small ingot that looked like gold and asked him: "What is that?" Mr. Wodiska took up the acid bottle from the table beside him and "touched" the yellow surface. The fluid took no effect. Then he rubbed the ingot on the stone kept for testing purposes until a good mark was obtained and put the acid on that. "Twelve carat gold," he replied decidedly as the result of his test. "There is not a grain of gold in the whole ingot," responded the refiner. Mr. Wodiska sat down promptly on the nearest stool and breathed so hard that he got red in the face. He could not believe it. Again he made his tests, this time filing into the ingot for the purpose. The acid made the report as before to his experienced eye, "twelve carat gold!" Then the refiner explained. The ingot had been sent to him, for test, by one of his customers, who had been deluded into buying it, and had grown uneasy when thinking how cheaply he had got it from an unknown man, whose anxiety to effect a private sale of it gave at least a questionable color to his right of possession. The refiner had tried it sufficiently to make sure that it was not gold, and approximately to get at a knowledge of what were its component metals, but had not yet made a sufficiently close quantitative analysis to determine their proportions. He affirmed that it was a mixture of platinum, aluminum, copper and silver. It would seem that very great difficulties must have been encountered in making such a combination, because of the widely different melting points of those metals, but he was sure that those were the constituents of the mass. A piece of the alloy that he had put through the rollers showed that it worked quite as well as gold and was as susceptible of high polish.

Since then the keeper of a small jewelry store on Avenue A has become the unhappy possessor of another ingot of the new alloy. He also bought from a man who had evident preferences for strictly private and quick sales, even if he did not get full gold value, and who volunteered no confidences as to how he obtained the ingot. It looked to the storekeeper like quite a pretty and profitable transaction, until he took his prize to an assayer. How many more victims have been caught already by the modest metallurgist who has invented this seductive material there is no knowing, but they are no doubt numerous. In each of the cases discovered the ingots have been small, such as

would be within the means of the keepers of little shops, and so find ready sale, especially when the seller conveyed the impression that he was a thief and was therefore willing to dispose of the chunk at less than its value. Of course, in a vast majority of instances, the victims would suffer their losses in silence, when they learned how they had been swindled, rather than avow that they had bought what they must have supposed to be stolen goods. The pawnbrokers have yet to be heard from. Doubtless they will bleed as freely on the solid twelve-carat gold ingots as they did at one time on the yellow diamonds dipped in aniline ink, before that trick was discovered. The thing is bound to make big trouble in the tents of Israel if that modest but talented metallurgist is at all industrious. Inspector Byrnes has lying upon the table in his office a big yellow bar of metal that once did duty as a "gold brick," and was the basis of the biggest and most famous swindle of its kind ever perpetrated in this country. It had a real gold corner, that was cut off by the intending purchaser, and that assayed so well that he paid several thousand dollars for the mass, only to learn that he had assayed all there was of it that possessed any value. That was considered a pretty clever trick at the time when it was played, but the new device of having a whole bar of solid twelve-carat (bogus) gold discounts it. And the pawnbrokers and people who buy gold cheap on speculation are not the only ones whom it behooves to take a lively interest in the new metal. Those fields will soon be worked out, but the ability to make the alloy will remain, and the next demonstration of it will be in "solid gold jewelry," turned out by unprincipled manufacturers and sold at cheap prices to the public. There will be no lack of excuses to explain most favorably its surprising cheapness; and who, of ordinary jewelry buyers, can tell that the stuff is not gold when it is so perfect an imitation as to "deceive even the very elect," as one might say?

CORRESPONDENCE.

THE CURE FOR SQUEAKY SHOES.

Editors AMERICAN ANALYST: Squeaky shoes are easily remedied. Have your shoemaker put some powdered soapstone between the outer and inner soles and the squeak will cease.

ONE WHO HAS TRIED IT.

Editors AMERICAN ANALYST: The remedy for squeaky shoes, of which you speak in a recent issue, is to bore two small holes, one inch apart and one-sixteenth of an inch in depth, in the center of the sole of each shoe. Then fill each hole with a drop or two of sweet oil, and let it soak well into the shoe before using. If the shoe still squeaks, repeat the remedy; a squeaky shoe always succumbs to the second dose of sweet oil.

ENVY.

Editors AMERICAN ANALYST: It is the friction of soles that causes all the shoe squeaking in this world, just as it is the friction of souls that causes almost all other sort of squeaking. If the shoemaker will take the trouble to put a little pulverized soapstone between the inner and the out soles of the shoes before they are put together, it will eventually prevent squeaking. I suppose dust of any sort would answer, but soapstone powder is perhaps the best. Publish this to the world, and on your own theory hasten the millennium.

SYMPATHY.

Editors AMERICAN ANALYST: In response to your editorial entitled, "Squeaky Shoes," and in answer to your inquiry, "Cannot some one suggest a method of suppressing the squeaky shoes that are peculiar to this season of the year?" I boldly answer "Yes." You state that "the man who will discover and announce an absolute cure for squeaky shoes will be greater than he

who invents a new religion." I desire to "announce" an "absolute cure," and confidently expect the greatness you so assuredly predict. Squeaky shoes are caused by the vacuum between the insole and the outsole. Treading on the sole of a shoe forces the air out of the vacuum, which produces the sound we call squeak. The proof of this is that a so-called "turned shoe," having no insole, forms no vacuum, therefore does not squeak. A piece of muslin or other similar material, gummed on both sides, which will adhere to the inner and outer sole, thus filling the vacuum, will of necessity prevent squeaking. This applies to shoes in process of making. Now, as to those which are already made—three or four pegs or brads driven in the outsole, between the shank and the toe, will close the vacuum and prevent the squeak.

B. G. O.

POWDERED ROSIN.—Powdered rosin, according to H. Hager, is liable to spontaneous combustion, owing to oxidation by the air, and it should be kept in tightly closed tin boxes.

FRUSTRATED.—St. Peter—"Well, did you go down to earth, take possession of that Infidel named Ingersoll, and walk him into church as I told you?"

Helpful Church.—"Yes, I found him in New York, and I walked him into the Church of St. Thomas; but he had on a suit of ready-made clothes, and the usher kicked him out."

SIMPLE TEMPERING PROCESS.—Some recent trials show that very thin blades, as flat springs and cutlery blades, can be effectively hardened and tempered by heating them and thrusting them into a mass of mineral wax, crude paraffine. The needles of sewing-machines and small drills have also been so treated successfully.

STEEL TIES.—Preparations are now being made to place a section of "Standard" steel ties on the Manhattan Elevated Railway in this city. The application of the "standard" steel tie to the Elevated road, it is expected, will reduce the noise in a very noticeable degree, and that the track will be much more reliable and smoother to ride over; and it is claimed, also, that a very great saving will be shown in favor of the steel tie.

SOAPSTONE COVERING.—Soapstone is largely employed to protect iron from rust, a so-called Chinese soapstone being preferred as a covering substance. In China this soapstone is also used for the protection of buildings made of sandstone that crumble under the influence of the weather. A thin layer of soapstone, in the form of a paint, has also proved an excellent protective covering for obelisks, statues, etc. Soapstone also possesses the property of having a remarkably fine grain, adapting it admirably for use as a coating for ships' bottoms, etc. Ground soapstone is one of the finest of substances, and nothing else will attach itself so quickly and firmly to the fibres of iron and steel. Soapstone is lighter as a covering substance, and, mixed with color to form paint, will cover a larger surface than zinc white, white lead or iron oxide.

SEAWEED PRODUCTS.—Formerly iodine, bromine, magnesia and potash salts were the chief products of seaweed, which was also used, when more or less decomposed, as manure on land adjoining the seacoast (it yields upward of two per cent. of ammonia). Some varieties were collected as articles of food in Scotland, Ireland and Norway, etc. (the species of the genus *Ulva*), and the large species of laminaria, especially *L. saccharina*, can be made to yield mannite. Of late years seaweed has been made into charcoal and into a material for whip-handles, and still more recent the curious substance algin has been produced from it, and is already in use as a stratum for photographic films and for other purposes. From the substance algin, just mentioned, an acid called alginic acid, has been produced, and, by acting upon the latter with nitric acid, a new light-colored dye, which is insoluble in water, but dissolves in alkalies, yielding a brown solution, has quite recently been discovered. The ammoniacal solution of this new product dyes cotton a fine Bismarck brown, which is not removed by soap, and is said to be not only equal to aniline dyes of the same description, but to excel many of them. A curious feature of this new product is that, contrary to what is observed with aniline dyes, it will dye cotton but not wool, and that its acid solutions will not act as dyes at all.

WATER DRINKING.

THE RELATIONS OF WATER TO THE BODILY ECONOMY.

Dr. J. Harvey Dew read a short paper before the Medical Society of the County of New York, January 28, 1889, relating to the importance of water from a physiological standpoint. He would deal with water as an element necessary to the exercise of certain functions, and in the chemistry of animal life. Both laity and profession showed a sad neglect of certain facts about water, the results of which inattention he saw every day.

The chief of these facts were:

1. The body consisted mainly of water, the latter forming in health from two-thirds to three-quarters of its bulk.
2. Water constituted nearly the total volume of the circulating fluids of the body, the blood, lymph, and digestive secretions.
3. It was the vehicle for the processes of digestion, absorption, and transportation of food.
4. It formed a large part of the ultimate tissues, and must be present in every process of assimilation.
5. It served as a vehicle for the circulation of waste matters.
6. Three or four pints (or pounds) of it were needed daily.
7. It could be observed that all thin persons partook scantily of water, whereas all fleshy people drank freely of it.
8. All diseases involved a disturbance of the processes of digestion, absorption, secretion and elimination.
9. A large proportion of the discomforts and troubles of the body arose from a poor performance of the functions depending upon water. It was proper that in health two pints of water should leave the body daily by the kidneys, two by the skin, and one and a half by the lungs, or five and a half total. Water taken at meal time was rapidly absorbed or passed through the pylorus. Lack of water caused constipation, made the secretions tenacious, the circulation defective, and the skin dry, and directly caused dyspepsia. The habit of taking water only in the form of such beverages as tea, coffee and beer, was not a good substitute for the drinking of pure water.—*New York Medical Journal*.

EGG LORE.

SOME BRITISH SUPERSTITIONS ABOUT EGGS.

"To hang an egg laid on Ascension Day in the roof of a house," says Reginald Scott, in 1584, "preserveth the same from all hurts." Probably this was written with an eye to the "hurts" arising from witchcraft, in connection with which eggs were supposed to possess certain mysterious powers. In North Germany, if you have a desire to see the ladies of the broomstick on May Day, their festival, you must take an egg laid on Maundy Thursday and stand where four roads meet; or else you must go to church on Good Friday, but come out before the blessing. It was formerly quite an article of domestic belief that the shells must be broken after eating eggs, lest the witches should sail out to sea in them; or, as Sir Thomas Browne declared, lest they "should draw or prick their names therein, and venificiously mischief" the person who had partaken of the egg. North Germans, ignoring this side of the question, say, "Break the shells or you will get the ague," and Netherlanders advise you to secure yourselves against the attacks of this disagreeable visitor by eating on Easter Day a couple of eggs which were laid on Good Friday. Scotch fishers, who may be reckoned among the most superstitious of folks, believe that contrary winds and much vexation of spirit will result of

having eggs on board with them, while in the West of England it is considered very unlucky to bring birds' eggs into the house, although they may be hung up with impunity outside. Mr. Gregor, in his "Folklore of the Northeast of Scotland," gives us some curious particulars concerning chickens and the best methods of securing a satisfactory brood. The hen, it seems, should be set on an odd number of eggs, or the chances are that most, if not all, will be added—a mournful prospect for the hen wife; also, they must be placed under the mother bird after sunset, or the chickens will be blind. If the woman who performs this office carries the eggs wrapped up in her chemise, the result will be hen birds; if she wears a man's hat, cocks. Furthermore, it is well for her to repeat a sort of charm, "A' in thegeethir. A' oot thegeethir." There are many farmers' wives, even in the present day, who would never dream of allowing eggs to be brought into the house or taken out after dark, this being deemed extremely unlucky. Outhbert Bede mentions the case of a farmer's wife in Rutland who received a sitting of duck's eggs from a neighbor at nine o'clock at night. "I cannot imagine how she could have been so foolish," said the good woman, much distressed; and her visitor, upon inquiry, was told that ducks' eggs brought into a house after sunset would never be hatched. A Lincolnshire superstition declares that if eggs are carried over running water they will be useless for setting purposes; while in Aberdeen there is an idea prevalent among the country folks that should it thunder a short time before chickens are hatched they will die in the shell. The same wiseacres may be credited with the notion that the year the farmer's gudewife presents him with an addition to his family is a bad season for the poultry yard. "Bairns and chuckens," say they, "dinna thrive in ae year," the probable explanation being that the gudewife, taken up with the care of her bairn, has less time to attend to the rearing of the chuckens. Besides the divination practiced with the white of an egg, which certainly appears of a vague and unsatisfactory character, another species of fortune telling with eggs is in vogue in Northumberland on the eve of St. Agnes. A maiden desirous of knowing what her future lord is like is enjoined to boil an egg, after having spent the whole day fasting and in silence, then to extract the yolk, fill the cavity with salt and eat the whole, including the shell. This highly unpalatable supper finished, the heroic maid must walk backward, uttering the invocation to the saint:

Sweet St. Agnes, work thy fast,
If ever I be to marry man
Or man to marry me,
I hope him this night to see.

If all necessary rites and ceremonies have been duly performed, the girl may confidently count upon seeing her future husband in her dreams—dreams which we should presume, as our Yankee friends say, would bear a strong resemblance to nightmare.—*Queen*.

ACROPHOBIA.

THE NERVOUS APPREHENSION OF HIGH PLACES.

Among the many curious psychical experiments that are now attracting the attention of scientific minds, the one to which the term "acrophobia" has been applied, has several points of interest. In referring to the term and phenomena, *Science* for January, 1889, defines it as an exaggerated condition of fear. Dr. Verga has recently described the phenomena in his own case: Though by nature not at all timid, all his courage leaves him when above ground. He complains of palpitations in mounting a step-ladder, for instance; finds it extremely unpleasant to ride on the top of a coach or even look out of a first-story window. This idiosyncrasy forbids him the use of an elevator, and the mere thought of those who have cast themselves down from high places causes tingling all over his person. His acrophobia even goes so far that the thought of the earth spinning

through space is enough to cause discomfort. Persons on a bridge high above the water, or on a cliff, or high up in a tower, are frequently overtaken by not only exaggerated fear, but by abnormal fear producing at times dizziness and even faintness. Another class of individuals are seized with an intense and at times uncontrollable desire to jump down from any height which they may have reached. A greater or less degree of this fear seems quite common, and perfectly compatible with normal mentality.

WEATHER WISDOM.

THE INDICATIONS WHICH FORETELL FROST.

For the benefit of farmers, General Greely, Chief of the U. S. Signal Service, gives the following simple and definite method by which in clear, cool weather, near the period of early or late frosts, a person may determine with considerable accuracy if frosts will occur the following night: "The approach of local frost can be foretold with very considerable accuracy from the readings of properly exposed dry and wet thermometers. A safe and simple rule to follow when the temperature is at 50 degrees, or below, is to multiply the difference between readings of the thermometers by 2.5, and when the sum thus obtained is subtracted from the reading of the dry thermometer, it leaves the approximate degrees to which the temperature of the air will fall the coming night, unless change of wind to a moister quarter or increase of cloudiness interferes. The value and importance of observations of this kind have not been sufficiently impressed upon farmers cultivating crops of a kind susceptible to frost and capable of protection." It may be stated in this connection, that the "wet thermometer" mentioned above is an instrument, the bulb of which is kept moist by its contact with a bit of lamp-wick fed from a small reservoir of water.

FRAUDULENT LEGISLATION.

THE LOCAL INSPECTION BILLS BASED ON FALSE PRETENSES.

The proceedings at Albany have exposed thoroughly the insincerity and pretense of the movement to exclude Western beef from Eastern markets. The bill having this object in view is one of the most outrageous that ever secured prominence. Its manifest unconstitutionality deprives it of a seriously dangerous character, for it could only remain in force long enough to permit a test case to be taken to court. The pretense that the protection of public health demands the enactment of such a law is unsupported by evidence and has no foundation in fact. The idea that the interests of this State can be promoted by such legislation, or can afford to face the consequences of establishing such a precedent, can scarcely be entertained by rational men. The reports from Albany show that the bill has attained a surprising degree of strength, but it cannot be supposed that the Legislature will adopt a measure so pernicious and so utterly devoid of merit or justification.—*N. Y. Commercial Bulletin*, April 8.

OYSTERS AS FOOD.

THEIR NUTRITIVE VALUE COMPARED WITH MILK AND MEAT.

Speaking roughly, a quart of oysters contains, on the average, about the same quantity of active nutritive substance as a quart of milk, or a pound of very lean beef, or a pound and a half of fresh codfish, or two-thirds of a pound of bread. But while the weight of

actual nutriment in the different quantities of food material named is very nearly the same, the quality is widely different. That of the very lean meat or codfish consists mostly of what are called, in chemical language, protein compounds, or "flesh formers"—the substances which make blood, muscle, tendon, bone, brain, and other nitrogenous tissues. That of the bread contains but little of these, and consists chiefly of starch, with a little fat and other compounds, which serve the body as fuel, and supply it with heat and muscular power. The nutritive substance of oysters contains considerable of both the flesh-forming and the more especially heat and force-giving ingredients. Oysters come nearer to milk than almost any other common food; their values for supplying the body with material to build up its parts, repair its wastes, and furnish it with heat and energy would be pretty nearly the same.

DOMESTIC DIETETICS.

SPECIALLY PREPARED, FROM PRACTICAL TESTS, FOR THE
LADY READERS OF THE "AMERICAN ANALYST."

SEASONABLE FOOD.

April.

MEATS.—Beef, lamb, mutton, ham, kidneys, liver, sausage, veal.

GAME AND POULTRY.—Brant pigeon, chicken, duck, turkey, goose, snipe.

FISH.—Anchovy, bass, cod, snipe, eels, carp, catfish, flounder, halibut, herring, lobster, mackerel, mussels, oysters, perch, rock-fish, salmon, smelt, whitefish, trout, sturgeon.

VEGETABLES.—Artichokes, beans, carrots, celery, garlic, lettuce, onions, parsley, parsnips, potatoes, shallots, spinach, turnips, water cress, radish, rhubarb, sea kale.

PRACTICAL RECIPES.

ITALIAN SOUP.—Cut the meat from a knuckle of veal; break up the bones and make a broth of them; cut half a pound of ham in slices, and lay them at the bottom of a stewpan, upon them the meat from the knuckle of veal, with the slices of four carrots, four turnips, a dozen peppercorns, two blades of mace, a large onion, and a head of celery; cover down close; stew till the gravy is drawn out, and the roots are quite tender; then pour over them the broth made from the bones of the knuckle until they are covered; add six spoonfuls of rice, stew four hours, work the soup through a sieve, and add vermicelli before serving.

LOBSTER SOUP.—Chop a lobster very fine, leaving out the fat and coral, after which mix with a teacupful of cracker crumbs, and a piece of butter the size of an egg. Boil three pints of milk and pour on the cracker, then add the lobster and boil.

STEWED LOBSTER.—Chop the lobster into good sized pieces; add to it butter, pepper and salt and a little water; stew for a few moments; thicken a very little with flour, and serve very hot.

BUNS.—Twelve ounces of sugar, eleven ounces of butter, one pint of milk, one-half pint of yeast, one nutmeg, three eggs, one teaspoonful saleratus; make up soft over night.

TEA CAKE.—One pint of flour, three eggs, two table-spoonfuls of butter, two tablespoonfuls of sugar, one cupful of milk, two teaspoonfuls of Horsford's baking powder. Bake in cups.

POTTED SALMON.—Cut a handsome piece from the middle of the salmon; remove the scales, and wipe it with a clean cloth; rub into it some common salt thoroughly; beat up some mace, cloves and whole pepper,

and season the salmon with it; place it in a pan with a few bay leaves; cover it with butter, and bake it until thoroughly done; remove it from the gravy, letting it drain thoroughly; then place it in the pots. Clarify sufficient butter to cover all the pots after the salmon has been put into them. Put it to cool.

TOMATO SAUCE.—Cut ten tomatoes into quarters, and put them into a saucepan with four onions sliced, a little parsley, thyme, one clove and a quarter of a pound of butter; set the saucepan on the fire, stirring occasionally, for three-quarters of an hour; strain the sauce through a horse-hair sieve, and serve with the directed articles.

ALDEN'S CYCLOPEDIA.

Alden's *Manifold Cyclopædia* continues to make its welcome appearance about once a month, and, as it gradually extends its progress along the alphabet, its usefulness for purposes of reference becomes steadily more apparent. It is a novel and very grateful experience to handle a work of encyclopedic scope reduced to such convenient compass. The eleventh volume carries us from Debt to Dominie. The 640 pages are packed with information of just the kind which the vast majority of reading people desire to obtain. Like its predecessors, it is truly *manifold* in its character. In a single volume it gives an unabridged dictionary, and a cyclopædia of information which is ample for practical use, is fully reliable, and is brought down to the present year. Among the articles treated at some length we notice that Debt, with its various sub-heads, has over 7 pages; while kindred topics, as Debtor and Creditor, occupy over 6 pages more. Delaware has about 5 pages; Delirium Tremens, 4 pages; Democracy, nearly 7 pages; Denmark, about 10 pages; Dentistry, about 6 pages; Descent of Man, 6 pages; Development, 11 pages; Diet, 8 pages; Digestion, 23 pages; Diphtheria, 5 pages. There are also a large number of really helpful illustrations. The form of the book is most convenient; the paper, printing and binding are all very good. This is emphatically *the Cyclopædia* for the people, and the extremely low price brings it within the reach of all.

HOLLOW INGOTS.—In Sweden hollow steel ingots are being made by casting steel in molds hung on trunnions, allowing the sides to chill to the required thickness and pouring out the still liquid in the centre. These hollow ingots go to England, where they are drawn out cold to tubing.

PACIFIC MAIL.—Great Britain joins the Canadian Government in a subsidy of \$1,250,000 per annum for fortnightly mail service to China and Japan from Victoria, B. C. Australia and New Zealand will subsidize the service to extend it to Auckland and Australia.

SACCHARINE IN GERMANY.—Secretary of State Von Maltzahn-Goltz has announced that it has been determined to place a tariff on the manufacture of saccharine throughout the German Empire, which will be virtually prohibitory, should it be found that the article is being used for the sophistication of sugars.

AMERICAN SILVER.—The silver circulation of the United States was just about doubled during the last four years. It was \$152,000,000 four years ago, and is now \$304,000,000. The present outstanding circulation includes \$57,500,000 in standard dollars and \$246,500,000 in silver certificates. The total money circulation at the beginning of this month was \$1,404,200,000, being an expansion of \$33,000,000 during the preceding twelve months.

A LARGE DIAMOND.—The "Julius Pam" diamond, which is valued at from £15,000 to £20,000, has arrived in London from Kimberley. It weighs 241½ carats, or fully 90 carats more than that other beauty, the Porter-Rhodes diamond, and was found in the New Jagersfontein United Mine, of which Mr. Julius Pam is principal owner. It is longish in shape, and of exquisite color—a pure blue white. The only larger diamond in existence is the Imperial, but it is said to be inferior in quality to the "Julius Pam."

HONEY CIGARS.—A unique process for flavoring cigars has lately been brought to light in Germany. They are stored for a longer or shorter time, usually a few weeks, in a hive tenanted by bees, and when removed are found to have acquired a most delicious floral bouquet.

MINISTERIAL RISK.—"I'm very glad to have been of any comfort to your poor husband, my good woman. But what made you send for me, instead of your own minister?" "Well, sir, it's 'typhus' my poor husband's got, and we dinna think it just reet for our ain minister to run the risk!"—*Punch*.

FAITH CURE.—A London doctor who despaired of being able to cure a woman suffering from an affection of the face and jaw finally wrote her that he was at the end of his resources, and added that *tempus edax rerum* (time which finishes up all matters) was the sole remedy. His patient, who was seemingly ignorant of Latin, got an obliging apothecary to furnish her with this specific, at the moderate price of 7s. 6d. After drinking several bottles of it she met her physician in London, and astonished him by her gratitude for the invaluable medicine he had recommended to her. The *Congregationalist* relates this story, and suggests that perhaps it was "a strange case of faith cure."

RUBBER SHOE MACHINE.—An ingenious machine has been perfected in Boston to cut rubber soles for shoes in rubber factories. Heretofore these soles have all been cut out by hand and by a pattern. This new invention takes rubber soling in sheets on a glass bed, and by a simple process, with a series of cog-wheels, the sharp knife is in a second's time passed around the form and cuts the sole clean. The different sized pattern can be adjusted in less than twenty seconds, and the machine will cut rights and lefts without changing the gear in the least.

SQUANDERING OF NATURAL GAS.—The *American Manufacturer* prints an article calling attention to the waste of natural gas which is going on in those districts where it has been discovered in abundance and devoted to practical ends. The article gives figures gathered from a certain number of factories in Pittsburgh, and the tables show that from 25 to 35 per cent. of the whole amount of natural gas consumed in these establishments is wasted, either through the use of defective apparatus or the carelessness and indifference of operatives. It cannot be said that there are reliable indications showing that there will be any general failure of the gas supply in the near future, but the dictates of ordinary prudence are all on the side of a consumption which is adequate to the carrying on of business, and not on the side of squandering valuable fuel merely because it is cheap and the supply seemingly inexhaustible.

GALVANIZING WROUGHT IRON.—The *American Machinist* gives the following method for galvanizing wrought iron: The wrought iron is first immersed in a cleansing bath of equal parts of sulphuric or muriatic acid and water used warm. It is then scrubbed with emery or sand, to clean it thoroughly and detach all scales, if any are left; after which it is immersed in a preparing bath of equal parts of saturated solutions of chloride of zinc and chloride of ammonia, from which bath it is directly transferred to the fluid metallic bath, consisting of twenty chemical equivalents of zinc to one of mercury; or, by weight, 640 pounds of zinc to 106 of mercury, to which are added from five to six ounces of sodium. As soon as the iron has attained the temperature of this hot fluid bath, which is only 680 deg. Fahr., it may be removed, and will then be found thoroughly coated with zinc. Care must be taken not to leave the iron too long immersed in this bath, as its affinity for iron is such that it may become dissolved.

NEW WOOL SPINNER.—A crudely constructed wool-spinning machine was exhibited in a model builder's shop in New York last week which has attracted considerable attention from persons interested in the wool industry. The inventor claims that he has solved the problem of continuous ring spinning by positive draft or attenuation. Hundreds of thousands of dollars have been expended by capitalists in experiments and in manufacturing machines in the Eastern States which have proved failures. The principle of the new invention lies in the use of three rollers, two of which rotate first in one direction and then in the other, and yet at all times draw the half-spun wool from the feed-roll. The rollers pass forward and backward, and the twist in the thread is not interfered with. The principle, the inventor claims, is a new one in mechanics. Wool is spun on the machine daily. The inventor claims that his machine will revolutionize wool spinning. He is George W. Shoemaker, of Scranton, Pa.

FINE THREAD.—A Dresden manufacturer has produced thread from the common nettle so fine that sixty miles of it weighs only two and one-half pounds.

HEAT OF GAS.—Fifteen cubic feet of gas will give as much heat as one pound of bituminous coal. Ten cubic feet of air is required for the perfect combustion of one cubic foot of gas.

OIL IS FUEL.—The experience at the Los Angeles, Cal., lighting station with crude oil instead of coal under the boilers, but corroborates what was long since proved. Oil gives an intenser and, above all, a more even heat than coal, not to speak of its convenience.

REPAIRING PIPE.—An ingenious means of repairing a break in a steam pipe consists in binding the break with wood strips, laid close together, and well served around with stout cord or rope, endwise separation being prevented by more rope crossing the break diagonally, and tied so as to draw the broken parts together; on the wood and the cord getting wet with steam, the joints become even tighter than before, as the wood swells and the cords tighten.

TOUGHENING PAPER.—A plan for rendering paper tough as wood or leather has been recently introduced on the Continent; it consists in mixing chloride of zinc with the pulp in the process of manufacture. It has been found that the greater the degree of concentration of the zinc solution the greater will be the toughness of the paper. It can be used for making boxes, combs, for roofing, and even for making boats.

HYDROPHOBIA.

There is one theme of popular interest that, like Banquo's ghost, "will not down," and that is, hydrophobia. The newspapers are never so crowded, even during presidential campaigns, but that they have ample space for stories about hydrophobia and madstones. The subject has a hideous fascination for most persons. And that the interest is in the subject itself, not in any particular theory about, or treatment of it, is demonstrated by the fact that people read with equal eagerness the scientific articles affirming that there is no such thing as hydrophobia, and the accounts of horrible

deaths attributed to it; the circumstantial reports of wonderful cures by madstones, and the contemptuous denials by learned physicians that there is any madstone or ever was any that was a whit more efficacious than a brick; the glorifications of Pasteur's treatment by inoculation for rabies, and the demonstrations that it has killed many and cured none. It seems strange that this interest should exist when, even if the terrible malady is real, and not merely imaginary, there is hardly one chance in a million that any given person will be affected by it. Other dangers, infinitely greater, swarm about us, yet we think nothing of them until they actually assail us. Tens of thousands die annually from diseases caused by impure blood, for each case of imagined hydrophobia, even including under the latter head those in which possible patients are supposably saved by mythical madstones, and yet the much greater danger is generally thought little of until it actually threatens life. There is hardly a disease that dangerously assails a vital organ which is not either caused by an impure condition of the blood or aggravated thereby to a probably fatal termination, if allowed to run its course. And the insidious, hardly observable progress of such maladies, in their earlier stages, until they have taken possession of the entire system, is a characteristic that enhances the peril. The bite of a dog, whether the beast is mad or not, is an incident of sufficiently unusual and forcible character to command immediate and earnest attention. But who thinks anything of danger if his bowels are constipated? "They will be all right to-morrow, no doubt." If they are not, any purgative medicine will do well enough to give them a start. There is the first serious blunder. Nine persons out of ten are indifferent whether the purgative they employ has any cathartic effects or not, if, indeed, they even know that there is any difference between a simple purgative and a cathartic. The result is that they find themselves compelled to habitually resort to purgatives to maintain a merely mechanical action of the bowels, with inevitably bad consequences, while the real seat of their trouble, the liver, is steadily

becoming in worse and worse condition, clogged with impurities, loaded with bile, torpid and inflamed. The kidneys, in an effort to do the liver's work, are overtaxed, and soon become seriously affected. By this time, the blood, laden with effete matter, is carrying the germs of disease and death to all parts of the body; the digestive, assimilative, nervous and respiratory organs are all gradually involved in the complex and comprehensive scheme of ruin, and at length the sufferer recognizes that he is "very sick, indeed."

"An ounce of prevention," said the wise Ben. Franklin, "is worth a pound of cure." When the sluggish bowels demand attention—and the demand should not be neglected until it becomes imperative—see that they are freed, and the liver at the same time stimulated to healthful action by a few doses of Ayer's Cathartic Pills. Then (for, brief as the trouble may have been, it has not failed to already set up a destructive action in the purificatory organs) resort to a light course of Ayer's Sarsaparilla, which is the most potent alternative medicine known, and thereby restore your health by expelling the seeds of disease from the blood and strengthening the vitality.

BUSINESS NOTES.

HORSFORD'S ACID PHOSPHATE IN GENERAL DEBILITY.

Dr. E. W. Hill, Glens Falls, N. Y., says: "I have used it in cases of nervous and general debility, and always with success. I consider it an excellent remedy for atonic dyspepsia, or any low state of the system."

ARMOUR'S MEAT EXTRACTS.

The merits of Armour's Extracts of Beef met with a gratifying acknowledgement at the Pure Food Exhibition, held at Philadelphia during the present month. Although there were several competitors (including the imported Liebig), Armour's Extract was declared the finest, and secured the highest and only award.

LOOK OUT for Imitations and Substitutes OF *Horsford's* ACID PHOSPHATE.

A variety of imitations and substitutes of this standard preparation have appeared under the name "Acid Phosphate," or a similar title, all of which differ materially from the genuine article.

Be sure the name "**HORSFORD'S**" is on the label. No other genuine.

At all druggists, and 224 William St., New York

LACTOPEPTINE.

The most important remedial agent ever presented to the Profession for Dyspepsia, Vomiting in Pregnancy, Cholera Infantum, Constipation, and all Diseases arising from imperfect nutrition.

Lactopeptine precisely represents in composition the natural digestive juices of the Stomach, Pancreas and Salivary Glands, and will, therefore, readily dissolve all foods necessary to the recuperation of the human organism.

CAUTION

We regret that we are compelled to caution the profession in prescribing Lactopeptine, but very careful investigation has proven to us clearly the necessity of it. Substitution of cheap and worthless compounds are being made in many cases where Lactopeptine is prescribed.

Lactopeptine is always UNIFORM, and its effects are SPECIFIC, and no one has ever been able to imitate its digestive value. If you do not obtain positive results when you prescribe Lactopeptine, you can be sure that some substitution has been made, and in such cases it may be necessary for the physician to prescribe Lactopeptine in the original ounce package to insure certainty of obtaining the genuine article. We can confidently make this assertion, knowing the scrupulous uniformity in digestive value of every ounce of Lactopeptine.

Lactopeptine has always been kept strictly in the hands of the Medical Profession, never having been admitted in any publications but Medical Journals. It is prescribed by the most intelligent and educated physicians in all parts of the world, and there are but few physicians who have ever used Lactopeptine that will not agree with the late Prof. L. P. Vandell, when he says: "Lactopeptine is one of the certainties in medicine, and in this respect ranks with Quinine."

In the various forms of Dyspepsia, in vomiting in Pregnancy, and in Mal-nutrition of children, there is no known remedy so positive in results.

A BUSINESS BENEFIT.

ADVANTAGES TO ADVERTISERS OFFERED
BY THE AMERICAN ANALYST.

It has not the limitations of a daily paper. No one reads yesterday's paper. A monthly lives at least a month, while a semi-monthly is fresh twice a month, and its audience is not limited by geographical lines, but the circulation is all over the United States and Canada.

It contains matters of interest to everyone, especially the ladies of the household, and is, therefore, sure of a careful perusal. Our audiences are intelligent and of the better classes, who have money to spend, and any well worded advertisement in our columns, giving real information, will receive a careful perusal.

Our rates are as low as our circulation affords. Large circulation and original matter cost money, and those advertisers who desire to realize these benefits must expect to pay reasonably for them.

Advertisements in our columns are permanent. Most of our subscribers bind their numbers.

Our advertisements are set up in an attractive form, sure to call the attention of the reader.

Anything that our readers want, or for which a demand is to be created, not wholly of a local nature, will pay to advertise with us.

We take only advertisements from legitimate houses of really meritorious goods, and give them all the editorial assistance they deserve; consequently our readers knowing this, have confidence in advertisements contained in our columns.

The fact that we have the best and largest houses in every branch of trade advertising with us, and that they always renew as their seasons arrive, proves beyond a doubt that they have found the **AMERICAN ANALYST** a good advertising medium. Why should not you?

MALTED MILK
THE ONLY FOOD
For Infants and Invalids

THAT CONTAINS ALL THE ELEMENTS OF NUTRITION, WITHOUT
A SINGLE ADDITION.

MALTED MILK does not have to be cooked.
MALTED MILK needs no addition of milk, only to be stirred up with water, which can be done without the slightest fuss or trouble.
MALTED MILK will not spoil in hot weather.
MALTED MILK is always ready for immediate use night or day, when traveling or at home.
MALTED MILK does away with the danger of using sour or impure milk.
MALTED MILK is free from starch and cane sugar. All foods that have to be cooked contain starch.
Ask your physician his opinion of **MALTED MILK**, he knows all about it.

Price, . . . 50 Cts. | Large Size, . \$1.00

RACINE, WISCONSIN, U. S. A.

OUR MISSION.

WHAT THE AMERICAN ANALYST IS DOING.

FIGHTING ADULTERATION.

The steadily growing favor which the AMERICAN ANALYST is constantly receiving at the hands of both the reading and the business public is the best evidence that could be afforded of the useful field of effort it occupies. It was the pioneer journal in this country to take up the fight against adulteration, and stands to-day, by public acknowledgment, the only competent exponent of the principles involved in that momentous struggle. To this end the realm of sophistication and fraud has been thoroughly explored, and its corruptions, as far as practicable, exposed to the public view. Charlatans, adulterators, and handlers of poisonous food have been summarily and uncompromisingly dealt with. Humbugs seeking to enrich themselves, through the sale of high-sounding specifics for human ailments, have been subjected to the crucial test of thorough chemical analysis of their goods, and where the latter, as too frequently occurred, proved to be utter frauds in name, composition, and pretended effects upon the system, the real facts have been placed before our readers in order to save the public from further unconscious imposition. The veil of chemical mystery in which tricksters of this kind ostentatiously envelop their processes of manufacture, protects them as yet from the criminal laws to which other confidence operators are held amenable, and the only method for counteracting their nefarious schemes is through public exposure by the newspaper press. In exposing this species of fraud, the AMERICAN ANALYST has conferred a benefit upon the community, to which the latter is giving grateful and substantial recognition.

SANITARY AND FOOD REFORMS.

In addition to the foregoing, the AMERICAN ANALYST is in constant co-operation with the Boards of Health of this and other cities, in efforts to secure sanitary and food reforms through organized methods, and while it is nobody's mouthpiece, it is conceded to be the only pop-

ular medium through which those bodies can bring their purposes and action intelligently before the general public. Reaching as it does all classes—manufacturers, merchants, physicians, chemists and private families all over the land—its influence is exerted over a vast radius, producing results as visibly marked as they are widespread.

DOMESTIC DIETETICS

Is a department of special interest to ladies. It is very different and far superior to the ordinary cookbook, in that it tells the housewife suggestively what to buy, what foods are in season, as well as how to prepare the many varieties of dishes, all in a practical way, easily followed. Other matters of great interest to housewives are also discussed.

PRACTICAL DISCUSSIONS.

Numerous other interests are also faithfully represented in our columns, such as articles relating to common experiences of society, the question of hygiene, and an infinite variety of practical subjects. In short, the AMERICAN ANALYST also keeps abreast in giving the fullest information on all matters directly or indirectly in the line of its proper field.

SCIENTIFIC INVESTIGATIONS.

The business transacted in the office of the AMERICAN ANALYST does not by any means all come to the surface in the pages of the paper. Minute analysis of chemical compounds, careful assays of minerals, examinations of questionable oils or doubtful condiments, and the many subtle operations incident to laboratory work are constantly required of us by correspondents far and near, and the results in many cases are not publicly recorded. In this manner, the influence of the paper encompasses a vast radius, from every point of which we receive constant expressions of approval, verbally, and in more substantial shape.

ITS VALUE TO ADVERTISERS.

No person can scrutinize the advertising pages of this journal without being impressed with the uniform high character of the numerous houses who find our columns the most desirable—because the most effective—medium for advancing their interests throughout the country in the several directions to which they respectively pertain. The steady growth of our subscription lists, extending to every State in the Union, and in fact all over the world, affords another gratifying evidence of the approval given to our endeavors to sustain genuine manufactures, and to expose spurious, fraudulent, and harmful knavery.

SUBSCRIPTION \$1 PER YEAR.

Considering the amount of practical information regularly embodied in its contents, together with the fact that the subscription price for an entire year is only one dollar we believe the day is approaching when the AMERICAN ANALYST will be regularly welcomed in every intelligent household in the land. Address,

ANALYST PUBLISHING Co.,
19 Park Place, N. Y.

FROSTED GLASS—A good imitation of frosted glass may be produced by applying to the glass a saturated solution of alum in water. It may be colored by the addition of aniline dyes. The coloring is not very permanent, however.

DRIED POTATOES.—In the *Voenna Sanitarnoie Delo* Dr. Jakov M. Shmulevitch emphatically draws attention to dried potato as an important food article, possessing some very valuable advantages in comparison with the vegetable in a fresh state. The advantages claimed for the article are these: (1) While fresh potatoes easily rot, blacken and sprout, dried potatoes, when kept duly protected from moisture, remain in the best condition for a very long time; and (2) being by far lighter and less bulky than fresh potatoes, are by far more convenient for preservation and transportation, which point has a great practical importance, especially in time of war. To be fit for culinary use the article requires a preliminary maceration in water for ten or twelve hours.

A NEW USE FOR LIQUID PEPTONOIDS.

Successfully used in Dissolving the False Membrane in Diphtheria.

A Physician writes: "In an experience of over thirty years I have never used anything to equal your LIQUID PEPTONOIDS as a local application with a spray. It will dissolve the membrane and destroy the diphtheretic odor in less than twenty-four hours. I use the LIQUID PEPTONOIDS full strength, as a spray, two or three times a day, in bad cases."

Used successfully by another physician in two desperate cases:—"I was induced to try LIQUID PEPTONOIDS in two very desperate cases of DIPHTHERIA. I think I never saw throats more heavily coated with exudate than were these, and I think I never saw it more rapidly disappear than in these cases, by frequent spraying with your LIQUID PEPTONOIDS."

LIQUID PEPTONOIDS can be taken by patients unable to ingest food in any other form. In *dyspepsia* and *loss of appetite* its effects are positive, its digestive properties assisting in the digestion of food taken and its peptogenic properties quickly stimulating the natural digestive secretions of the stomach.

PANCROBILIN.

Prepared (in both Liquid and Pill form) from Extract of Pancreas and Bile.

This preparation is designed expressly to increase the digestion and absorption of fats.

We believe that the fat-digesting properties of pancreatine and bile are inseparable, and that without their union in the intestinal tract but little, if any, fat would be digested and absorbed.

PANCROBILIN will be found of great service in *Phthisis* and other wasting diseases, *Nervous Prostration*, *Constipation*, *Inanition*, *Malnutrition*, *Intestinal Indigestion* and wherever there is a failure to assimilate fats.

If the skin is first wet with LIQUID PANCROBILIN, the inunction of oils will be greatly facilitated.

LIQUID PANCROBILIN is put up in pound bottles. PILL PANCROBILIN is put up in bottles holding 100 pills. The coating of the pills will resist acid digestion, when given as directed, but will be quickly dissolved in the alkaline secretions of the duodenum.

PHOSPHO-CAFFEIN COMP.

(Granular Effervescent.)

Formula for each dessertspoonful:—

Caffein.
Acidi Phosphorici aa, grains, ss.
Antipyrin.
Ext. Apii. Grav. dulc. (Celery), aa grains, j.
Sodium Bromide, grains, v.

The satisfactory results produced by PHOSPHO-CAFFEIN COMP. in *Headaches*, *Neuralgia*, *Insomnia*, *Neurasthenia* and general *Nervous Irritability*, are not due to the effect of any one ingredient, but to the happy effect of the combination. A thorough series of comparative tests have demonstrated the superiority of the above formula over any other in the market.

REED & CARNRICK, New York.

THE FAMILY CYCLOPÆDIA OF USEFUL KNOWLEDGE.

This is unquestionably one of the most interesting, entertaining and instructive books ever published. It is a universal educator for every member of the family circle, filled with useful information from beginning to end, and this information is given in such an attractive and pleasing way that the book is quite as entertaining as it is instructive. It treats of hundreds of subjects of which no man, woman or child who seeks to be well informed can afford to be ignorant, yet of which the masses of people are entirely unlearned. It contains the cream or substance of a dozen ordinary volumes, and is one of the most valuable and useful books a family can have in the house. No living man is so well informed that he may not learn from it. It is a book for the masses, for old and young, rich and poor, and will be read with pleasure and profit by all. It will likewise be found of great value as a work of reference. The book is profusely and elegantly illustrated, and is conveniently divided into departments, as follows: **Biography, History, Natural History, Travels, Manners and Customs, Etc.; The World Illustrated, Useful Arts and Manufactures, Trees, Plants, Fruits, Etc.; Great Inventions, Mining, Wonders of the Sea, Familiar Science, Law for the Masses, Statistical and Miscellaneous.** All the above subjects are fully and ably treated in this valuable book. It is a vast storehouse of useful and entertaining knowledge—unquestionably one of the best and most valuable books ever published in any land or language. No cyclopædia ever heretofore published at twice the cost is to be compared with this book in point of artistic make-up, beauty, and excellence of illustration, and quality of contents. As a holiday or birthday present for any one, nothing more appropriate or acceptable could possibly be selected. **THE FAMILY CYCLOPÆDIA OF USEFUL KNOWLEDGE** is a large and handsome book of 544 pages, 12mo, printed upon fine paper and elegantly bound in cloth, embellished with artistic designs in black and gold. It contains **Two Hundred and Seventy-three Beautiful Illustrations**, the original cost of which was over \$5,000. The book will be sent by mail, post-paid, to any person sending a **New Subscription with One Dollar**. It is as large and handsomely gotten up as books usually sold at \$1.50 and \$2.00, and in the quality of its contents is worth a dozen ordinary volumes.

Tabasco Pepper Sauce

OR LIQUID PEPPER.

Is simply the Pulp of the Ripe Pepper Extracted by Pressure.

The seed of this Pepper was obtained from Central America, and by careful cultivation in Louisiana for many years has been so improved in strength, flavor and aroma, as to have become a new variety of Red Pepper, superior to all others. The pulp is so handled as to retain all the flavor, strength, aroma and color of the ripe fruit, and to keep unimpaired in any climate. It excites the appetite, promotes digestion, and is pronounced, by connoisseurs, to be the finest condiment in the world. For medicinal purposes it recommends itself by its purity, strength and diffusible form.

Manufactured by E. McILHENNY,
NEW IBERIA, LA.

For Sale by all Wholesale Grocers.

NATRONA BI-CARBONATE OF SODA.

ABSOLUTELY PURE.)

The nature of the raw material from which NATRONA BI-CARBONATE OF SODA is made—viz., kryolith, a mineral containing *pure sodium*—insures a purity and uniformity of product which cannot be obtained from any other known material. In making Bi-CARB. SODA from any other raw material, the use of sulphuric acid is a necessity, but none is used in any part of the process of making NATRONA BI-CARB.; hence its entire freedom from the slightest trace of arsenic, which is always present in ordinary soda. Its absolute purity and entire freedom from all traces of *sulphate of soda*, common salt and other impurities, render NATRONA BI-CARB. NEARLY TASTELESS, and being bolted through the finest bolting-cloth, insures the finest stage of division.

To these indisputable facts the attention of CONSUMERS of soda is specially called. They are IMPORTANT, and should influence both those who use and those who sell soda, to buy and sell NONE BUT THE BEST.

The NATRONA BI-CARB. Soda is kept in stock by almost every wholesale druggist and grocer throughout the United States, of whom it may be ordered.

Natrona Bi-Carb. Soda is unequalled by any other brand of English or American Manufacture.

PRICE BAKING POWDER CO.
NEW YORK. CHICAGO. ST. LOUIS.

COLDEN'S LIQUID BEEF TONIC.

AN INVALUABLE AID IN THE TREATMENT OF
ALL CASES OF DEBILITY.

Established 15 Years. Endorsed by Scores of Physicians.
Essentially Different from all other Beef Tonics.
Beware of Imitations.

COLDEN'S LIQUID BEEF TONIC consists of the Extract of Beef (by Baron Liebig's process), spirit rendered non-injurious to the most delicate stomach by extraction of Fusel Oil, soluble Citrate of Iron, Cinchona, Gentian and simple aromatics. An official analysis of this preparation by the eminent chemist ARTHUR HILL HASSALL, M. D., F. R. S., and an endorsement by SIR ERASMUS WILSON, F. R. S., is printed on the label of each bottle.

Its Range of Action Embraces all Cases of Debility.

By the urgent request of several eminent members of the medical profession, I have added to each wineglassful of this preparation two grains of SOLUBLE CITRATE OF IRON, which is designated on the label as "No. 1," while the same preparation, without Iron, is designated on the label as "No. 2." It acts directly on the sentient gastric nerves, stimulating the follicles to secretion and gives to weakened individuals that first pre-requisite to an improvement, an appetite.

As I will, upon application, send a sample bottle of Colden's Liquid Beef Tonic to any physician in regular standing. Please ask your Dispensing Druggist (if he has not already a supply) to order it. In prescribing this preparation physicians should be particular to mention "COLDEN'S" viz: "EXT. CARNIS. FL. COMP. (COLDEN)." It is put up in pint bottles and can be had of Wholesale and Retail Druggists generally throughout the United States.

CONGRESS OF APPLIED MECHANICS.

There will be held this summer in Paris at the Conservatoire des Arts et Métiers, an International Congress of Applied Mechanics, under the patronage of a Committee of Honor, comprising savants and engineers of renown both from France and from other countries, who will give the work of the Congress the benefit of their influence, and the weight of their authority. The President of the Committee on Organization is Monsieur Phillips, ex-Inspector General of Mines. The five members appointed from the United States are, in the order of their mention on the official bulletin, Messrs. Robert Grimshaw, President, Polytechnic Section American Institute, N. Y.; R. H. Thurston, Director, Sibley College of Cornell University, Ithaca; Professor Egleson, Columbia College School of Mines, N. Y.; and the Presidents of the American Societies of Civil and of Mechanical Engineers. At this Congress, among the

important subjects submitted for discussion are the unification of the horse-power; the choice of materials in machine construction, transmission to a distance, and distribution of work, by other means than electricity, (water, air, steam, cables, etc.); automatic cut-off engines with several successive cylinders; thermo-motors other than the steam engine. Other topics, treated by papers, will be improvements in steam engines since 1878; progress among associations of owners of steam appliances; and improvements in apparatus for the generation of steam, more particularly sectional boilers.

SUICIDAL LEGISLATION.

The Minnesota Legislature, on April 12th, passed the Meat Inspection Bill providing that all meats exposed for sale in the State must be taken from animals inspected alive within the State twenty-four hours, or less, before slaughtering. The real purpose of the measure was to exclude Chicago and Kansas City dressed beef from sale in Minnesota, but a thin disguise of its intention on fictitious grounds of sanitary precautions against the marketing of diseased meat was imparted to it in order to invest it with some attributes of constitutionality. The result was promptly seen in the advance of twenty-five per cent. in the price of beef in all the important markets of Minnesota within three days after the passage of the bill. The consumer in the few States that adopt similar restrictive laws, will probably have occasion to inquire into the motives that actuated his Assemblyman or State Senator in legislating him into increased expenses before the arrival of the next election day. The Minneapolis *Commercial Bulletin* is outspoken in its deprecation of the unwise action of the Minnesota lawmakers. It concedes the desirability of stimulating, by all proper methods, the live stock and meat industries of that State, but it "cannot welcome or endorse this legislation. The free commercial relations and obligations of this commonwealth to the other members of the Federal Union are of the most sacred character, and should, at even considerable loss to us, be preserved inviolate. It is clearly possible that the precedent established by this legislation may react upon us with disastrous force. It is probable that it may induce a feeling of alienation from which grave harm to some of our interests may at some time come. The State of Minnesota has allowed itself, in several directions during the past few years, to seek its own advancement in ways that have proved not only ineffective, but in the end harmful to itself. Our railway legislation has been bad both for the railroads and ourselves; our lien law, at length declared unconstitutional, worked long enough to alienate foreign confidence and capital from us and make us a 'horrible example' to other States; our proposed usury law, fortunately now killed in the Senate, was but another effort of our shortsighted selfishness; our single tax coquetry, happily stopped, was but another symptom of the evil at work in our present inconsiderate public ambition." But the effect of this system of class legislation is likely to extend over a wider and more harmful scope than our

Minneapolis contemporary calls attention to. The truthless pretence set up by the advocates of these measure that the Western dressed beef is liable to be diseased, may, if not peremptorily checked, deprive us of our extensive and increasing British export trade in dressed and canned beef in the same manner that France and Germany have been lost to us as markets for our hog products. Great Britain is almost the only market for our large surplus of beef cattle, and already an apprehension has arisen there of our live cattle injuring their native herds, so that legislation compels the slaughter of all imported beef cattle at the port at which they are landed. Our dressed and canned beef, on the other hand, are regarded more favorably and are freely and welcome admitted. It will not be difficult, however, for insane legislation, such as the Eastern beef raisers and retail killers are so strenuously urging, with the support of a subsidized or careless press, and the occasional connivance of an unthinking minority in the cattle growing regions of the West, to cast such a cloud of suspicion upon our dressed meat product as will evoke some Parliamentary enactment for its exclusion from Great Britain. If we persist in denouncing and slandering our own products it is only reasonable to expect that foreign purchasers will some day take us at our word and refuse to longer buy of us. The consequence of such a step would be disastrous and far-reaching.

BRIBING THE INSPECTORS.

The announcement was recently made at a public meeting that the meat inspectors are not discharging their duties in the manner they should. It was further stated that a member of the Central Body not long ago discovered an alleged butcher who was displaying meat which was wholly unfit for human food, and when the member said that he would complain to the meat inspector, the alleged butcher replied: "Oh, that's all right; I'm solid with the inspector," or words to that effect.

The above is from the *Butchers' Advocate*, of this city, appearing in its issue of April 17th. It would be interesting to the consumers and householders of New York to know to what extent the constituents of the *Advocate* carry on this contraband traffic in meat "wholly unfit for human food." That the amount of poisonous food thus foisted upon our citizens is of considerable magnitude is shown by the fact that the authorities have found it necessary to impose a check upon it by the appointment of a corps of inspectors, who are supposed to prevent its sale. The butchers, however, are too shrewd to submit to such restrictions; and, according to the *Advocate*, they overcome the inspection by bribing the inspectors—a proceeding modelled on the methods of Jacob Sharp, with which some of our New York butchers are but too familiar. It would be a smart thing now for the Legislature to adopt the *Advocate's* insane advice to increase the functions of these notoriously purchaseable officials by excluding from our markets all beef except such as is slaughtered in this city, and inspected before slaughter. The public would

ROCK CANDY and ROCK CANDY SYRUPS.

For use at the Soda Fountain and in all Pharmaceutical Preparations requiring chemically pure syrup. Warranted to keep in any climate. Order of Wholesale Druggists, Grocers, Confectioners, or of

DRYDEN & PALMER,
19 Hudson St., New York.

soon be constrained to renounce the use of beef absolutely if it were obliged to depend upon the honesty of the *Advocate's* constituents. The greatest safeguard we have against these combinations of knavish butchers and bribe-taking inspectors is in the use of the Western dressed beef, which is so carefully managed that not an ounce of it is ever offered for sale in unfit condition. To what a fever of ungrammatical frenzy the *Advocate* would be subjected if the poisonous swindle in which its friends have been detected had been associated with the handlers of dressed beef! This "local inspection" business is a hollow sham as it exists, and it would be the height of absurdity to extend its scope to cover the whole supply of every city in the State.

DAIRY ADULTERATIONS.

The Secretary of the Home and Foreign Produce Exchange of London, recently notified the Secretary of the Chicago Produce Exchange that American dairy products are in danger of being excluded from the English markets, under act of Parliament on account of adulteration. The London Exchange Secretary says as it is of the utmost importance to the future of the trade that American cheese and dairy products continue above suspicion, the matter calls for prompt action. The Secretary of the Chicago Exchange has forwarded copies of this letter, together with other facts, on the prevalence of dairy adulterations, to the Legislatures of the various States, and efforts will be made to secure the passage of bills in all Western and Northwestern States for the prevention of fraud in the manufacture and sale of adulterated dairy products.

A GOOD WORD FOR TOBACCO.

The effect of the habitual use of tobacco on the health is the subject of an interesting and significant paper by Dr. F. H. Bosunth, published in the *Medical Record* of this city. The writer calls attention to the fact that the Anglo Saxon races have been using tobacco for smoking and chewing purposes during the past four centuries. They contracted the habit from a race which, as far as history and tradition teach us, were remarkable for their vigor of body and mind as well, and, as far as we know, were an unusually long-lived people. In the time that we have been using the weed there is no evidence to show that the race has in any way deteriorated, but, on the contrary, it is abundantly shown that the average duration of life has increased nearly 50 per cent. There is no evidence to show that in this time the race has been more subject to disease, but rather that they are less so. There is no evidence to show that the race has lost anything in its intellectual activity, but, on the contrary, it has been a time of most marvel-

ous fecundity in all that is great in literature. Dr. Bosunth, while not advocating the use of tobacco, is opposed to the wholesale denunciation of "the weed" maintained by some extremists, his experience showing that as a general thing it is innocuous, and in cases where its use is at all baneful the sufferer is himself conscious of the fact, and controls the remedy. Briefly, the object of the essay is not a plea for the use of tobacco, but simply to suggest whether we had not best abandon the idea that it is a drug whose use is pernicious in every way to body, mind and morals, and rather to take the view that it is one of God's good gifts to man.

THE CARRION TRAFFIC.

The Board of Health is making a great mistake when it refuses to make public the names of men who are caught selling diseased and unwholesome meat. The mere excuse that it will injure the business of these men is not sufficient, and is only placing a premium on their dishonesty. If the carrion had not been seized it would have been sold, and any man who will expose it once for sale will do it again.

The above confession quoted from the organ of the anti-dressed beef faction of this city affords startling evidences of what the New York public might expect if the machinations of that unscrupulous element should prevail, to the exclusion of the better imported article. The "diseased and unwholesome meat" in the New York market is exclusively that which has been subjected to only "local inspection," and the poisoners who sell it to the unwary and confiding public are from the ranks of the men who have been bellowing so loudly in opposition to the carefully-inspected and refrigerated dressed beef from the West. The excellence of the latter prevents competition, but if its sale should be prohibited by law, the knaves would have full swing. They should be made to swing after another fashion.

EMOTIONAL JOURNALISM.

Whenever the editors of the *AMERICAN ANALYST* demean themselves as gentlemen should, we will be ready to discuss, in a spirit of inquiry, the questions on which we differ; but we do not intend to waste the space of *The Record* in replying to blackguardism and drivels. If we were to reply to a recent editorial of that paper in the same vein in which it was written, we would say: The editors of the *AMERICAN ANALYST*, a bob-veal sheet emitted in New York and committed to the task of boosting the manufacturer of a fraudulently labelled compound, are as insolent as they are illogical. One of these unique specimens of metropolitan brass writes M. D. after his name; both of them have earned the right to use A S S.

The above sweet effusion is from the *Record*, of Allegheny, Pa., of April 13th. It reads like an extract from that other famous specimen of rustic journalism, the *Arizona Kicker*. We are lost in abysmal wonder as to what the *Record* could achieve in the line of blackguardism if it should ever change its mind and give vent to its evident native genius for scurrility.

CHEMISTRY'S TRIUMPHS.

THE ARTIFICIAL PRODUCTION OF SUGAR, COFFEE AND COCAINE.

The problem of producing cane sugar synthetically, through still far removed from the point when it can be used practically, has been brought another step nearer solution by the continued researches of Emil Fischer, in conjunction with Julius Tafel. In a recent paper, published in the *Berichte* (1889, 97), they give the results of their researches, the most remarkable of which is that they have succeeded, for the first time, in producing a sugar which can be fermented by yeast, like the natural sugars. The only difference from the latter is this, that the artificial sugar is optically inactive, but the discoverers hope to obtain optically active sugars by

means of fermentation. The new sugar has, provisionally, been called *acrose*. The starting point is glycerine, from which, by way of its decomposition product, *acrolein*, two new kinds of sugar: $C_6H_{12}O_6$ had already some time ago been prepared by the authors, by means of treatment with baryta or alkalis. One of these sugars had been designated *alpha-acrosazon*. It has now been found that this latter may be partly converted, by means of hydrochloric acid, into a new substance, resembling glucoson, which the authors term *alpha-acrosan*. When this is treated in a dilute aqueous solution, with zinc dust and acetic acid, it is completely reduced inside of one hour. The mixture is then treated with hydrosulphuric acid, the precipitate filtered off, and the filtrate evaporated in a vacuum. The residue is dissolved in absolute alcohol, the solution filtered, and the filtrate, after being highly concentrated, mixed with much ether. This precipitates the new sugar, *acrose*, in colorless flakes, which soon change to a syrup, and has the greatest resemblance to natural sugars, having a sweet taste, reducing Fehling's solution, and responding to other tests characteristic of sugars. Merck some time ago announced that he had succeeded in producing true salts of caffeine with citric, cinnamic, and hydriodic acids, which did not decompose or split up when coming in contact with water. It will be remembered that Prof. J. U. Lloyd (see *New Rem.*, 1881, 38) succeeded in preparing crystallized caffeine citrate, but this salt did not bear solution in water without decomposition. In what manner Merck succeeded in producing a permanent salt is not stated. But the citrate, as now available, is stated to be soluble in 30 parts of water at 42° C. Alfred Einhorn has succeeded not only in making cocaine, the alkaloid of coca leaves, artificially from benzoyl-ecgonine, by introducing into it the methyl group, but he has also found that a whole series of other "cocaines" may be obtained by causing other groups to enter instead of the methyl group. In a recent paper (*Ber. d. deutsch. chem. Ges.*) he announces and describes three such compounds, one of which is the lower homologue of true cocaine, while the others are metameric or higher homologues. Two of these could not be obtained in a crystalline form, but only in form of oil. The third, however, as well as the salts of all three, are crystallizable. Whether any of these new "cocaines" possess special therapeutic properties has not yet been ascertained, or at least not been announced. It is not improbable that some of them will be found serviceable.

A RETORT COURTEOUS.

WESTERN DRESSED BEEF DESIRABLE FOR ITS QUALITY AND CHEAPNESS.

The following article from the *Merchants' Mail* of Albany, of April 12th, gives a candid explanation of the reasons which actuate the honest portion of the New York press in opposing the "local inspection" imposition:

The *Butchers' Advocate* of New York goes into a fit because the *Merchants' Mail* and the *AMERICAN ANALYST* see fit to defend Western dressed beef. We are of the opinion that the two papers mentioned above are abundantly able to take care of themselves against such rantings as the *Butchers' Advocate* sets forth from week to week. We do not pretend to speak for the butchers of New York city and Brooklyn and never have. We do pretend to know something about the butchers up this way, and know just what we are talking about when we say that, when one butcher can be found who sells home dressed beef ninety will be found who sell Chicago dressed beef. These are cold, hard facts, and the *Butchers' Advocate* or any other paper or persons can't deny them and do it truthfully. The *B. A.* will put that in its pipe and smoke. A few more facts, however, may not be amiss for the *B. A.*, and here they are: Before we had dressed meat the price of home dressed beef was whatever the ring saw fit to make it. No need of going further than West Albany to verify the above

statement, and every butcher in Albany, Troy and vicinity knows it. An accident, blockade or delay of any kind would result in the ring putting up the price of meat. The consumer was never consulted in such cases. It wasn't for the interest of the ring to consult anyone outside of their own circle. The butcher could pay the price demanded or let it alone. Do we have such scenes now as were daily enacted at West Albany some years ago? By no means. Why? Western dressed beef made its appearance and it acted as a lever in keeping the price of home dressed beef down, and at the same time affording the butcher better profits and the consumer better meat at a lower price than he ever had before. These are facts. Who is anxious for the passage of this bill outside of some of the large wholesalers and butchers of New York city and Brooklyn? No one, unless it is an isolated case here and there. Pass the bill, and what would be the result? Why, the price of beef would take such a jump as would astound even the members of the Legislature themselves. New York State cannot raise one-twentieth of the beef that is being daily consumed. To carry out the spirit of this bill cattle would have to be transported here on the hoof. That means an advance in the price, because it is cheaper to transport dressed beef than the live stock. New York State not being able to supply her own demand asks, or rather the advocates of this bill ask, that live stock shall be brought here which, as shown above, must increase the price. We believe the consumer has rights in this matter that the Legislature is bound to respect. The tendency to-day is towards the formation of Trusts, and especially in food articles, and the poorer classes are the ones who are forced to stand it. We believe, and there are many eminent persons who are of the same opinion, that there is more danger of the cattle becoming diseased in transit than when they are killed in the West and the meat sent on as at present. It has always seemed to us one of the most humane things that ever occurred when Western dressed beef made its appearance. The suffering caused by the treatment that cattle formerly received while in transit was a disgrace to human beings. At the present time the counties of New York, Kings, Queens, Westchester and Richmond are quarantined on account of the existence of pleuropneumonia, and yet, in the face of this, some desire to keep out of our market a better article than our own. "It is the greatest kind of a Trust," the advocates of this bill exclaim. Well, we will acknowledge that Western dressed beef is a trust. We will favor any Trust that keeps the price of an article down, and this is what Western dressed beef does. Its opponents, however, want a Trust that puts the price up. Between the two Trusts we prefer the Chicago dressed beef one for the reasons enumerated above."

EASTER EGGS.

HOW TO COLOR AND DECORATE THEM.

The custom of giving eggs as presents about Easter time is ancient and wide-spread, but its true origin is lost in obscurity. In England it has been revived of late years, and the shops at Easter are full of prettily-dyed ornamental eggs of all descriptions and of various prices, many of the more expensive ones containing valuable gifts. A basket or dish of freshly-boiled and colored real eggs placed on the breakfast table on Easter morning is, however, preferable to imitation eggs, whilst the preparation of them will give pleasure and occupation to the younger members of the family. There are many ways of coloring the eggs; logwood-chips, if used in small quantities, will cause the eggs to assume a port wine color, whilst if more chips are added the eggs will be black. It is impossible to say the exact quantity of chips required, depending on the quantity of water used, but it can easily be ascertained when the liquid is sufficiently dark by taking up a little

in a spoon before putting in the egg. For brown eggs, boil them in strong coffee; for yellow eggs, in onion peelings. Cochineal will make eggs any shade, from a deep crimson to a lovely pink, according to the quantity used. Another way of coloring eggs is to wrap the eggs up in pieces of silk of different shades; place them carefully in a saucepan containing plenty of warm water in which has been dissolved a lump of common washing soda, and boil for an hour. Then remove the silk covering, and allow the eggs to cool gradually. When sufficiently cool to hold in the hand, rub each one over with a little butter or pure lard, which gives to them a nice bright look. Be careful not to crack the shells when boiling the eggs, or the color will boil through into the egg, thus spoiling it and making it unfit to eat. Eggs may be made to assume a sort of marble appearance by boiling them in a piece of tartan silk, or in several pieces of colored silk sewn together, and tightly wrapped round the eggs. Bought dyes, such as Judson's, may be used as well for coloring the eggs, but are not so effective and bright, nor so amusing to use. A pretty effect may be obtained by daubing the eggs here and there with grease before boiling them, or dipping them into the boiling dye. Wherever the grease is, the dye does not take, and therefore they come out spotted or striped, or with other devices, as the case may be, or the name of the intended recipient of the egg may be written on it in the same manner, when it will appear afterward quite distinct. In dyeing eggs, care should be taken to use only one spoon, and that an old one; an old saucepan should also be used, and will answer the purpose perfectly if previously thoroughly cleaned. Some of the prettiest eggs are coated with gold and silver; this is not difficult to do. Boil the eggs for an hour in plain water only; then, when quite cold, rub them all over with painters' size. Procure some gold or silver dust, such as bookbinders use; put it in a saucer or plate; roll the eggs gently one at a time till the egg is entirely covered. Or the egg may be first colored, and a name, a date, or any other device be put on in the same manner with the size and the dust. Gold and silver leaf can be used if preferred instead of the dust, but is more troublesome to manage.

NATURE'S FORCES.

TRANSFORMATIONS OF THE SEVERAL FORMS OF ENERGY.

As far as we know at present, the simplest forms of matter—the elements—are distinct entities, and incapable of being transformed into one another. They unite among themselves to form all the innumerable substances of which the universe is made up, but in themselves are unchangeable and indestructible. A piece of iron, for instance, can never be changed into a piece of copper, or a grain of hydrogen gas into oxygen. Neither can we destroy or annihilate a single atom of these elements. There is just exactly as much hydrogen, oxygen, iron, copper, etc., in the universe as there has been in all the past ages, and exactly the same amount will continue to exist to all eternity, although their combinations with themselves and other elements may be altered an infinite number of times. Until some future investigator, in following certain clues at present but dimly perceived by us, discovers that the elements are but modifications of one primal form of matter, we must continue to believe that they are unchangeable. When, however, we turn to the different forms of force, or energy, by which, with matter, the universe reveals itself to our senses, we find a very different state of affairs. Heat, light, electricity, chemical action, magnetism, force, or work, are all readily changed from one to the other with the greatest ease. Let us take, for instance, an electric station, and follow the transformations of energy there produced. In the first place, we find chemical action taking place in the furnace connected with the steam boiler and engine. Carbon is being oxidized, or burnt, and this chemical energy is

transformed into the heat energy of the fire; the heat energy is changed to force, or work energy, in the boiler and engine; the work energy turns the dynamo machine, and is changed, first into magnetic energy, and then into electric energy. The electric energy passes out through the wires, and is changed into light energy, by the arc and incandescent lamps; or, if it enters an electric motor, it again goes through the changes of magnetism and work, and is finally dissipated as the heat of friction. If the current is employed in an electro-plating bath, it is converted into chemical energy once more, and the circle of transformations is complete. Nearly all the different forms of energy of which we make use in our daily life originate in the chemical action of the combustion of wood or coal. This we transform into heat, to warm our dwellings; into light, to illuminate our cities and buildings, and into work, to turn our machinery and produce all the various manufactured articles which add so much to our comfort. The power exerted by men and animals is transformed from the chemical energy of the oxidation of the food in their bodies, while the power of wind and water comes more directly from the sun—that great central reservoir of energy, from which even the energy stored up in coal first had its source. Our homes are lighted by the sun at night just as truly as by day, only in the former case the light energy comes to us indirectly, by way of the coal fields, where it has been lying stored up for millions of years, awaiting the pick and shovel of the miner. It is also true that all these transformations of energy take place according to mathematical laws. A pound of coal, or pure carbon, will, when oxidized or burnt, always produce exactly so many units of heat. From this heat just so much power or work can be obtained, and no more; this power will produce an invariable number of units of electricity or magnetism, and the electricity, when transformed into chemical action, will decompose a definite weight of a chemical compound. Every pound of coal, every ounce of food, represents a certain amount of energy, and by no possibility can a greater amount be obtained from it. It is the legitimate field of the inventor to endeavor to utilize all this energy in the form in which it is desired, and prevent the enormous waste by its transformation into undesired forms, which at present occurs even with our best and most economical machinery. Any attempt to do more is as sure to end in failure as would an attempt to prove that two and two added together make five. The final transformation of all energy is, as far as we know, into heat. Every pound of coal we burn, whatever forms of energy it may pass through, is finally converted into heat, and contributes, in an infinitesimal degree, to raising the temperature of the whole universe. We are unable with our present knowledge, to follow it any farther, and can only look forward to the final exhaustion of the solar reservoir, and the cessation of all light, heat, and other forms of energy, as well as life itself. We can see nothing in the future ages but a cold, dark, lifeless universe. There may, however, be some undiscovered law by which the wasted heat energy may be gathered up and again concentrated into centres like our sun, to pass once more through the same cycle of changes; but, as yet, such a law is only a matter of speculation, and belongs rather to the province of the metaphysician than to that of the scientist. While we know but little of the past, we know still less of what changes the future may bring in the condition of the universe.—*Popular Science News.*

TO BRONZE PIPES.—A convenient preparation for re-bronzing gas fixtures is made by mixing bronze powder with any transparent varnish—say, amber, gum damar or copal. Do not mix more than you are going to use at once, because most bronze powders act as powerful dryers, and what you have left of the mixture soon becomes hard and useless. It is best to put little of the varnish in a small, flat saucer and some of the loose powder next to it, and mix with the brush while you are using it, as a painter mixes colors on his palette.

BOSTON BEEF.

THE SUPPLY MOSTLY DERIVED FROM CHICAGO.

"I should say," said a Boston dealer to a Boston *Journal* reporter, "that fully 90 per cent. of all the beef used in Boston is brought from the West. Seventeen years ago Boston took the lead in adopting the refrigerator car system for the receiving of shipments of dressed beef, and the city does the largest business in this line at present." It is learned that Boston receives about 100 car-loads of dressed beef weekly, not speaking of an average of 140 carloads for exportation. The refrigerator car wrought remarkable results in this line of business. Most of the dressed beef comes through Chicago, which is the great distributing point for the West, but a considerable and increasing proportion is now coming direct from Omaha and Kansas City. The fact that a Boston firm has recently established at Minneapolis a branch house for the shipment of beef to the latter from Omaha indicates the confidence which it has in the trade.

CHEAP AND POOR.

ADULTERATION SUSTAINED BY THE DEMAND FOR CHEAP ARTICLES.

Those who mix, adulterate and manufacture imitations of staple food products have reduced the matter to a science, and to such an extent has the adulteration of food products been carried on that it is becoming more and more difficult for grocers and general storekeepers to obtain goods that they can guarantee to be absolutely pure. Many of these products are not unhealthful, there is nothing in them of an injurious character, but they are simply not what they purport to be. Authorities in the East have been carefully investigating the matter, and their report shows that after examining 623 samples of food products, 303 were found to be adulterated and 320 were pure or up to the legal requirements. Figuring this out, one can see that over 48 per cent. of these goods were adulterated and only a trifle over 51 per cent. were pure. The following is a list of the articles examined and the per cent. of adulteration, which we take from a recent article in the *New York Commercial Bulletin*, a reliable authority:

ARTICLES.	Total.	Pure or Standard.	Adult'd or not Standard.

It is said that pure lard is becoming very scarce in the market. Most of the lard sold is a compound of beef fat, cotton-seed oil and hog fat. Coffees are extensively adulterated; ground peas, chicory, wheat, rye and beans being used. All of the samples tested as mentioned above were sold as pure, only eight out of twenty-four

passed favorable inspection. The worst adulteration was found in ground pepper, mustard, cinnamon, ginger and cloves. Much of the pepper was composed of a mixture of buckwheat hulls, cocoanut shells and cayenne for flavoring. Ginger was composed of corn meal, turmeric and cayenne. The dexterity and ingenuity with which the spicemen produce these articles was found to be surprising. Baking powders were also found to be badly adulterated. It would, therefore, seem to the *Criterion* that about the only protection from imposition the reputable dealer can have is to deal only with well-known and reliable houses and to beware of all goods offered at suspiciously low prices. Whenever goods are put upon the market at a price below the actual cost of the raw material, it shows conclusively that something must be wrong with them or that there is a reason for it; that reason generally is that the goods are largely composed of foreign substances which are introduced into them to give them bulk and desirable color and flavor.—*Grocer's Criterion*.

MICRO-ORGANISMS.

DO THEY POSSESS THE POWER OF VOLUNTARY CO-OPERATION.

There exists organisms which lead a life of habitual isolation, but which understand how to unite for the purpose of attacking prey at the desired time, thus profiting by the superiority which numbers give. The *Bodo caudatus* is a voracious Flagellate possessed of extraordinary audacity; it combines into troops to attack animacula one hundred times as large as itself, as the Colpods, for instance, which are veritable giants when placed alongside the *Bodos*. Like a horse attacked by a pack of wolves, the Colpod is soon rendered powerless, twenty, thirty, forty *Bodos* throw themselves upon him, eviscerate and devour him completely. All these facts are of primary importance and interest, but it is plain that their interpretation presents difficulties. It may be asked whether the *Bodos* combine designedly in groups of ten or twenty, understanding that they are more powerful when united than when divided. But it is more probable that voluntary combinations for purposes of attack do not take place among these organisms; that would be to grant them a high mental capacity. We may more readily admit that the meeting of a number of *Bodos* happens by chance. When one of them begins an attack upon a Colpod, the other animacula lurking in the vicinity, dash into the combat to profit by a favorable opportunity.—*Binet's Psychic Life of Micro-Organisms*.

AMERICAN LARD.

CORRECTION OF THE MISAPPREHENSIONS REGARDING ITS FOREIGN USE.

Judging from the character of the items going the rounds of the press regarding American lard in foreign countries, one would be led to believe that every foreigner to a man stood ready to kick our product into the ocean as a result of his suspicion that it contained cotton-seed oil. Recent misinterpreted dispatches from Canada, Mexico and France have furnished ground for the coloring which was given to the news. While it is true that the subject of American lard has been taken up by the officials in the countries mentioned, its adulteration formed only a minor part, if any, of the needs that suggested its exclusion. Protection to certain industries in the countries that have brought up the subject will be found to be the real reason for their desire to exclude our product. The packers of Canada feel the need of protection, and they are trying to get it, but they are strongly opposed in some sections, and it is very doubtful if they can secure aid from the government unless adulteration furnishes them grounds for argument. A story has been going the rounds of the press to the effect that the Mexican government pro-

posed to exclude American lard. The only excuse for the origin of this myth was the fact that an official chemist of the Mexican government analyzed a number of samples of American lard and published the result. There has been no action taken by the government on the subject, nor is there likely to be any at an early date. On May 1, the French government will impose a duty on lard containing cotton-seed oil, not because the compound is considered unwholesome, but for the simple reason that it comes in direct competition with olive oil. The *New England Grocer*, speaking of the American lard trade with foreign countries, says that the fact remains, however, that this year the exports here exceeded those of last year by 34,749,562 pounds. This large increase is somewhat of a surprise, considering the attempts abroad to prejudice the consumers against American lard. The increase in this season's exports is greatest in the United Kingdom, which has so far taken in round numbers 20,000,000 pounds more than last season, while the Continental ports have taken about 15,000,000 pounds more.—*Chicago Grocer*.

FRUIT OR MEAT.

A PHYSICIAN TESTIFIES IN BEHALF OF VEGETABLE DIET.

The food which is most enjoyed is the food we call bread and fruit. In all my long medical career, extending over forty years, I have rarely known an instance in which a child has not preferred fruit to animal food. I have many times been called upon to treat children for stomachic disorders, induced by pressing upon them animal to the exclusion of fruit diet, and have seen the best results occur from the practice of reverting to the use of fruit in the dietary. I say it without the least prejudice, as a lesson learned from simple experience, that the most natural diet for the young, after the natural milk diet, is fruit and whole meal bread, with milk and water for drink. The desire for this same mode of sustenance is often continued into after years, as if the resort to flesh were a forced and artificial feeding which required long and persistent habit to establish its permanency as a part of the system of every-day life. How strongly this preference taste for fruit over animal food prevails is shown by the simple fact of the retention of these foods in the mouth. Fruit is retained to be tasted and relished. Animal food, to use a common phrase, is "bolted." There is a natural desire to retain the delicious fruit for full mastication; there is no such desire, except in the trained gourmand, for the retention of animal substance. One further fact which I have observed—and that too often to discard it, as a fact of great moment—is that when a person of mature years has, for a time, given up voluntarily the use of animal food in favor of vegetable, the sense of repugnance to animal food is soon so markedly developed that a return to it is overcome with the utmost difficulty. Neither is this a mere fancy or fad peculiar to sensitive men or over sentimental women. I have been surprised to see it manifested in men who were the very reverse of sentimental, and who were, in fact, quite ashamed to admit themselves guilty of any such weakness. I have heard those who, gone over from a mixed diet of animal and vegetable food to a pure vegetable diet, speak of feeling low under the new system, and declare that they must needs give it up in consequence; but I have found even these (without exception) declare that they infinitely preferred the simpler, purer, and, as it seemed to them, more natural, food plucked from the prime source of food—untainted by its passage through another animal body.—*Richardson in Longman's Magazine*.

ELECTRICITY FOR SNAKES.—A report comes by way of Germany, that a novel use of electricity has been made in India, for the prevention of the intrusion of snakes into dwellings. Before all the doors and around the house two wires are laid, connected with an induction apparatus. Should a snake attempt to crawl over the wires, he receives a shock of electricity, which either kills or frightens him into hasty retreat.

TIME MEASUREMENT.

WHY THE HOURS AND MINUTES ARE DIVIDED INTO SIXTIETHS.

Why is our hour divided into sixty minutes, each minute into sixty seconds, etc.? Simply and solely because in Babylon there existed, by the side of the decimal system of notation, another system, the sexagesimal, which counted by sixties. Why that number should have been chosen is clear enough, and it speaks well for the practical sense of those ancient Babylonian merchants. There is no number which has so many divisors as 60. The Babylonians divided the sun's daily journey into 24 parasangs, or 720 stadia. Each parasang or hour was subdivided into 60 minutes. A parasang is about a German mile, and Babylonian astronomers compared the progress made by the sun during one hour, at the time of the equinox to the progress made by a good walker during the same time, both accomplishing one parasang. The whole course of the sun during the 14 equinoctial hours was fixed at 24 parasangs, or 720 stadia, or 360 degrees. The system was handed on to the Greeks, and Hipparchus, the great Greek philosopher, who lived about 150 B. C., introduced the Babylonian hour into Europe. Ptolemy, who wrote about 150 A. D., and whose name still lives in that of Ptolemaic system of astronomy, gave still wider currency to the Babylonian way of reckoning time. It was carried along on the quiet stream of traditional knowledge through the Middle Ages, and, strange to say, it sailed down safely over the Niagara of the French Revolution. For the French, when revolutionizing weights, measures, coins and dates, and subjecting all to the decimal system of reckoning, were induced by some unexplained motive to respect our clocks and watches, and allowed our dials to remain sexagesimal—that is, Babylonian—each hour consisting of sixty minutes. Here we see the wonderful coherence of the world, and how what we call knowledge is the result of an unbroken tradition of a teaching descending from father to son.

BANANA CULTURE.

A FRUIT THAT "SEEDS" IN ONLY ONE SPOT ON THE EARTH.

The banana and the plantain have always formed one of the staple foods of tropical countries. Improved communication and an ever increasing demand for the banana gave, some fourteen years ago, a great impetus to its cultivation. The sugar-planter of the West Indies was gradually but surely being ruined by beet and bounty-fed sugars. The banana was with him a tree to be hated. In Jamaica every negro had a few planted in the small clearing round his hut, and a bunch of the fruit would feed him and his family for a week. When so provided, he saw no need to go out to work in the cane fields. At first the banana-walks were made anywhere on the estate; generally on an abandoned cane-field, which cost less to clean, but experience has taught the planter that certain sites suit the tree best. The best place for a banana-walk is a valley or hill-side having a western prospect. The large leaves attract the dew, and in the early mornings a patch of bananas looks as if it were encrusted with diamonds. These drops of dew are soon evaporated by the morning sun, but if the trees are shaded the plant absorbs most of the moisture. The ground for the intended patch is thoroughly cleaned and "stubbed." Then "suckers" must be obtained, as the banana is only known to seed in one small spot on the earth, the Andaman Islands. These "suckers" sprout from the root of the banana-tree when it is one year old. They are torn from the parent tree and may be shipped long distances, being hardy and long-lived. About 400 or 500 trees are planted to the acre, and now the chief care is to see that the weeds, and especially the creeping ones, are

kept down; otherwise they will soon choke the young plant. The banana tree bears fruit in its first year. The bunch hangs down on a stem which springs from the tree just under its frond of leaves. This stem extends beyond the fruit, ending in a purple cone, under which is a small insignificant bunch of flowers. The early morning visit to a banana-walk exposes one to the equivalent of a thorough rain drenching. As each bunch becomes full, but while still green, the tree is chopped down with one or two blows from a "machete," great care being taken that the fruit is not bruised. The bunch is then carried on the head of a negro to the dray that carries it down to the port. The bunches are packed between layers of "trash," and on being unloaded from the drays are sorted into "nines," "eights," etc., that is to say, into "hand bunches" of those numbers. A "hand" of bananas is one of the small portions that go to make up a bunch. Bananas are paid for with ready money on the beach, according to the number of "hands" and the time of year. In January, February and March they cost from 12 to 18 cents a bunch; in April, May and June from 48 to 72 cents. In a good year a bunch of bananas cost 4 cents to land at the beach, all expenses included. The planter has the risks, however. A hurricane will in an hour destroy every tree, and for that year the cultivation is, of course, a dead loss. In Jamaica and Honduras at least the thefts by the negroes form a large item. Landed in New York the bunches bring from 50 cents to \$2, according to the time of year and the size of the bunch. As soon as the banana begins to give a good shade the space between the trees are planted with cocoa, a tree that must have shelter from the sun. Almond trees and the flamboyant are also planted to give the shade for the cocoa when the bananas have ceased to bear profitably; that is, in three or four years.

CRUSHING A COUNTERFEIT.

AN ATTEMPTED CHICAGO SWINDLE NIPPED IN THE BUD.

Quite a stir was produced in legal circles in Chicago on April 13th by the quick, sharp work of a legal representative of John Duncan's Sons, of New York, who are the agents for the United States of Lea & Perrins' Worcestershire sauce, in suddenly checkmating a very bold attempt to flood the market with a counterfeit sauce under a close imitation of their labels. Detectives had been busily at work for some time in tracing the originators of this latest scheme to defraud the public, and finally traced it to the Chicago agent of a newly-formed syndicate of wholesale fraud and forgery. This triumvirate consisted of the Chicago representative, Lewis P. Wells; a man from Denver, Col., named Aaron C. Decker; and a Philadelphian named Edwin T. French. With a few thousand dollars to invest in anything that looked like a profitable scheme, they hit upon the, to them, novel idea of imitating Lea & Perrins' Worcestershire sauce. Having consulted a lawyer they believed that, so long as they refrained from actually counterfeiting the labels and only made a close imitation, especially if they used a name very closely resembling Lea & Perrins, they could flood the market and realize a handsome profit. But as all such schemes, though ever so cunningly devised, fail for the want of some connecting link, this met a similar fate. Shrewd detectives found that Lewis P. Wells and Lee Perrins, whose name was to furnish the pretence to similarity, were one and the same person, and upon boldly charging him with the attempted fraud he weakened and confessed the crime. Upon his affidavit to that effect and that of John P. and David Duncan, Counsellors Kraus, Mayer and Stein at once obtained an injunction from Judge Blodgett, of the U. S. Circuit Court, forever forbidding the manufacture of this imitation, and the beautifully-executed drawings for the fraudulent label was seized at the Adams Express office and given up to be destroyed. This drawing is a wonderful work of the design-

er's art. Though in every respect different in design from the genuine label, it is so similar to it that it would readily deceive any one but those fully conversant with the genuine labels. In other words, it is not a counterfeit in any sense nor a *fac-simile*, but a very close and deceptive imitation. At first sight it appears to be the same, but when closely compared with the genuine the manner in which it was sought to deceive the eye becomes more apparent. Messrs. Lea & Perrins can be congratulated at this narrow escape from another great fraud upon their trade-mark. This is the third or fourth instance where such counterfeits and imitations have been thwarted in Chicago. The history of the various attempts to imitate this sauce, its bottles, labels and wrappers, make interesting reading. Originated over fifty years ago in England, and imported into this country nearly that length of time, it has from the very first seemed to be the goal of all the counterfeiters. In every case, however, they were followed up, arrested, or prosecuted to the full extent of the law. At various times, as the laws affecting trade-marks and proprietary rights were changed and modified, the courts had to be applied to for a fresh construction of these laws, so that the expenses incurred by the proprietors in simply defending their rights became enormous, but having bravely done so the attempts to counterfeit have almost entirely ceased, and the fraud is almost wholly confined now to close imitations which avoid, as far as possible, any approach to counterfeiting, but endeavor, necessarily in a small way, to reap the benefit of the enormous advertising the article has had by putting upon the market spurious goods of somewhat similar appearance, so as to deceive the unsuspecting buyer. As any article to enjoy the public favor as long as this sauce had must be well made, of good ingredients, it is, of course, costly, and the profit lies only in the enormous quantities sold. An imitator naturally uses inferior ingredients, and thus enhances his profits, but cannot duplicate his orders, and thus loses what little trade he can establish. It may be said that though these imitations have been attempted by those who have been in the employ of the original manufacturers, and were supposed to be somewhat familiar with the real formula, not one of these has ever succeeded in making an imitation which could not be instantly detected. So, also, analyses have been made and published by some of the best chemists in England and the United States, yet no one has ever been able to put the sauce together in a way which would for an instant deceive a judge. Now, it has been asserted, and with good reason, that even if Messrs. Lea & Perrins should furnish the name and amount of each ingredient contained in the sauce, unless they also gave the manufacturing directions it could not be successfully made. In this country there have been plates made that were counterfeits of the original labels, but in every instance they have been quickly detected, and the perpetrators of the fraud tried and convicted wherever they were found and arrested. In several instances, however, they had got so far as to spend their time and money, and were compelled to escape the process of law; leaving everything behind them to be seized and destroyed; in other cases, there were only partial imitations made, and these also were soon found out and stopped. The most numerous frauds, however, were those where the old genuine bottles were bought up and refilled, but a late judicial opinion that such refilling of an inferior imitation in a bottle bearing a genuine label, was practically a fraudulent use of a trade-mark, and misusing a guaranty signature, has also put an end to this nefarious procedure. In this latest case, the fraud consisted in carefully avoiding to counterfeit any of the labels or signatures, but by making a very close copy, both in wording and general appearance, and using a similar name for the guaranty signature, to mislead the purchaser into the belief that he was buying the genuine article. This attempt having been stopped by an injunction, and the original drawing for the label, which had never been put in the form of a plate, having been seized and delivered up for destruction to the

American agents of Lea & Perrins, it would seem as if the wholesome lesson thus taught evil-doers should enable Messrs. Lea & Perrins, and their American agents, John Duncans, Sons, to enjoy in peace the fruits of their fifty years labor.

DOMESTIC DIETETICS.

SPECIALLY PREPARED, FROM PRACTICAL TESTS, FOR THE LADY READERS OF THE "AMERICAN ANALYST."

SEASONABLE FOOD.

April.

MEATS.—Beef, lamb, mutton, ham, kidneys, liver, sausage, veal.

GAME AND POULTRY.—Brant, pigeon, chicken, duck, turkey, goose, snipe.

FISH.—Anchovy, bass, cod, snipe, eels, carp, catfish, flounder, halibut, herring, lobster, mackerel, mussels, oysters, perch, rock-fish, salmon, smelt, whitefish, trout, sturgeon.

VEGETABLES.—Artichokes, beans, carrots, celery, garlic, lettuce, onions, parsley, parsnips, potatoes, shallots, spinach, turnips, water cress, radish, rhubarb, sea kale.

PRACTICAL RECIPES.

BAKED FISH.—Make a sauce of a bunch of parsley, one and a half pints of milk, a lump of butter the size of an egg, the yolk of two eggs, a little nutmeg, salt and pepper; boil till thick, and then put with it some cold boiled fish; put in a greased baking dish, sprinkle with crumbs, and bake.

TO USE UP COLD VEAL.—Cut the meat from the bones and chop into small bits. Put the bones in a stew-pan, with a little warm water to make a gravy. After stewing a short time, take the bones out, put in the chopped meat, and a bit of finely-chopped lemon peel. Thicken with flour, season, and serve on toast.

MEAT CROQUETTES.—Take cold meat of any kind, chop it fine, with a hard boiled egg, a little onion, a little savoy, parsley, catsup, pepper and salt, and the white of a raw egg. Make into small rolls, dip into raw egg and bread crumbs, and fry.

CREAM SALAD DRESSING.—One teacup cream, yolks of four eggs, butter the size of an egg, one-quarter cup vinegar, one teaspoonful salt, one teaspoonful mustard, cayenne pepper. Beat the eggs for fifteen minutes, stir into it the pepper, salt and mustard, add the cream and strain. Melt the butter and vinegar together, and when cool, add to the cream, and cook till it is a little thicker than custard.

ROLLS.—One pint milk, one tablespoonful lard, two tablespoonfuls butter, one teacupful yeast, two teaspoonfuls sugar if liked, a little salt. Put shortening in milk, and scald. When the milk is cold, make the dough; when perfectly light, cut it down with a knife, and let it rise again. Repeat this several times; then make into rolls and put in the pan, and let them get very light before baking.

CHARLOTTE DE RUSSE.—One pint milk, one coffee cup sugar beaten together to a stiff froth, one pint milk, one and a half sheets American isinglass. Set the milk into hot water, put in the isinglass, broken up, until dissolved. When quite cold, stir into the cream, flavor with vanilla. Line a dish with sponge cake. Pour in the cream, and set away to cool.

YORKSHIRE TEA CAKES.—One quart of sifted flour, loosely measured, mixed with two heaping teaspoonfuls Horsford's Baking Powder. Rub into it one ounce of butter, and then add one egg, well beaten, and mix the whole with enough sweet milk to make a thick batter. Bake immediately in small tins or gem pans. Have the tins or pans hot before filling.

GLUTEN ROLLS.—The following is the recipe for the celebrated Clifton Springs Sanitarium gluten rolls: Three cups Farwell & Rhine's health flour; two teaspoonfuls of Horsford's Baking Powder; half a teaspoonful of salt; one and a half pints milk. Mix with spoon to a light dough, and bake in a battered iron roll-tin in a hot oven for twenty-five minutes.

TRUSTS.

AN EXPLANATION OF THE MODERN SYSTEM OF CORPORATE COMBINATION.

All our readers are now familiar with the name and reputation of "trusts." All understand that they are in some way great monopolies, which control the production and prices of one and another article of commerce. All have heard that they have brought new dangers to the commercial world, and that legislatures and courts of justice are being used to control or to cripple them. But just what a "trust" is, or how it works, is not quite clear to most people. The *Commercial Bulletin*, of Boston, has lately taken the trouble to summarize and to illustrate the characteristic qualities of this pretentious and threatening commercial usurper. Our contemporary begins with the preliminaries to the organization. The first movement is the incorporation of all the companies and firms which intend to form the trust. Certificates of stock being issued to the members of the new corporations in proportion to their several interests in the old partnerships, officers being elected, each of these corporations select one of its members to be its representative in the trust. These "representatives" then constitute the "trust." Let us suppose that all the new corporations interested had been dairy firms, and that it is proposed to make a "cheese trust." They give their trust some such name as the National Dairy Company. They organize as a company, with officers, but do not incorporate. Their name stands for nothing, says the *Bulletin*. They are not a person within the meaning of the law. But to them as a company the entire aggregated capital stock of all the cheese-making corporations represented in their body is transferred. Having no personal existence, incapable of suing or being sued, they are, nevertheless, made the owners of the entire capital stock engaged in the various companies. In lieu of this stock, they issue to its former holders certificates representing each one's interest in the aggregated stock. In this way the National Dairy Company becomes the owner of all the capital, plant, material and product of the companies from which it has been made up, and from six competing firms they are created into one monopoly. Then the trust decides what price shall be paid for crude milk, and what price shall be paid for the manufactured cheese. It decides what the output of cheese shall be for the coming year, and it apportions to each of the companies represented its share of the estimated output. It is all one to the individual company whether it produces ten pounds or ten million pounds, since it receives its due proportion of the profits of the trust, whatever may be the contribution of its own works. The effect of the trust is to multiply the powers and to diminish the responsibilities of capital. Individually the six cheese companies would have no particular force in controlling the total amount of cheese to be manufactured, or in fixing the price to it. But consolidated they become a dangerous power. Suppose there is a seventh cheese firm which refused to come into the company. It soon find that the trust has contracted to secure all the available milk. It must go to a great distance for its supply, pay a higher price for it, and a heavy freight bill besides. When its goods are put upon the market, it finds that cheese is selling so low that it must either do a losing business or none at all. In a little while it is forced to quit, or come into the Trust. Many things, concludes our contemporary, are lawful for an individual to do which are a crime when

committed by several individuals acting upon a common understanding. And the reason of this is plain. When one man seeks to effect an end advantageous for himself, but injurious to others, he may act entirely within his rights. But when several persons conspire to do such a thing, they bring to the purpose of injury so great a power as to require restraint. The nature of Trusts lies not entirely in the fact that their aims are hurtful to the public, but that their power is a source of public danger also.

FAITH HUMBLES.—At a recent trial of two apostles of "faith cure" in Sioux City, Iowa, for practicing medicine without a license, the judge instructed the jury to find for the defendant, as it was no crime under the laws for a person to pray for an afflicted neighbor. If those two apostles had seen a man in danger of drowning, and, instead of calling assistance and trying to rescue him, had knelt down on the bank and prayed for his deliverance, we might have stood in awe of their faith, but we would have been tempted to boot their works.

MOTION AT REST.—An exceedingly interesting illustration of the phenomenon of "motion at rest" was recently exhibited before the Royal Institution, London, the demonstration being so complete that small letters placed on a disk, revolving several thousand times a minute, were seen and read with entire distinctness. The accomplishment of this unique result was brought about by means of an electrical arrangement, which caused brilliant sparks to illuminate the print at the exact instant only when the type was vertical. But for the buzzing produced by the great velocity of the disk, the words would have been supposed to be entirely at rest. This application of the electric spark, of course, gives a ready means of observing any and all changes which may take place in either matter or machinery in rapid motion.

A MAGNETIC INDICATOR.—A clock recently patented in France is an imitation of a tambourine, on the parchment head of which is painted a circle of flowers corresponding to the hour figures of ordinary dials. On examination two bees, one large and the other small, are discovered crawling among the flowers. The small bee runs rapidly from one flower to another, completing the circle in an hour, while the large one takes twelve hours to complete the circuit. The parchment surface is unbroken, and the bees simply laid upon it, but two magnets connected with the clock-work inside the tambourine move just under the membrane, and the insects, which are of iron, follow them.

RAILWAY SPEED.—Three hundred miles an hour is the proposed speed for the electric postal railroad of the future. An experimental line has been erected at Laurel, 20 miles from Baltimore, Md. A compromise between the pneumatic tube and the ordinary railroad carries a miniature train of two cars solely for mails and light parcels, without any attendance. The road has three rails, one above the car for carrying the current, and two below which carry the cars. The cars are built of sheet iron and are two feet square and twenty-one feet long. Speed will be regulated and power of brakes applied by electricity solely. If the experiment at Laurel succeeds it is stated that similar roads will be laid between Baltimore and Washington and elsewhere.

PORTABLE ELECTRIC LIGHT.—A useful piece of apparatus has come into use in Germany in the shape of a traveling electric light. The affair is very simple. A dynamo, with an engine to drive it, is mounted on a wagon, something like that of a steam fire engine, containing boiler, fuel box and water tank complete for a night's service. A dozen or so of jointed poles, a corresponding number of arc lamps and a supply of wire complete the equipment, and the whole is readily drawn by a pair of horses to the place where it may be needed. On its arrival the poles are set up where required, and stayed with wires fastened to stakes driven into the ground; the lamps are hung to them and properly connected, and the engine is set in motion. The lamps immediately kindle, giving a light nearly as bright as day over the whole neighborhood as long as it is needed. Any number of lamps, from one to fifty, may be operated from a machine of suitable power, and as they may be suspended anywhere, and are not affected by rain or wind, it would seem that the apparatus might be very useful to contractors and others who have to carry on night work on an extensive scale.

CORK.—In experiments recently made in France on the elasticity of cork, it was found that disks of that substance, when submitted to a pressure of sixty-six tons to the square inch, were compressed to one-fifth their thickness, and recovered their original dimensions in exactly ten minutes after the pressure was removed.

USES OF RARE METALS.—Some rare metals, possessing special qualities, are required for certain work. Thus palladium is used in making some parts of time-pieces, and iridium for the points of gold pens, and the uninitiated have no idea of the value of such scarce products. Vanadium costs, for instance, \$12,000 per pound; zirconium, \$7,900, and lithium, which is the lightest of metals, \$7,700 per pound. Rhodium, which is extremely hard and brittle, and is only fusible at a very high temperature, fetches \$2,500; and iridium, the heaviest substance hitherto discovered, costs \$1,200 per pound. It will therefore be seen that gold and silver are far from being the most precious metals, as far as their market value is concerned.

TAKE HEED.

If you watch a careful and intelligent man in charge of an engine, you will see that the instant a "skreeking" sound reaches his ears he snatches up an oil-can and hastens to find and attend to the journal in need of lubrication. He does not attempt to stop the warning note by heaving more coal into the fire under the boilers, or setting the safety valve to bear higher pressure of steam, or putting a fresh coat of paint on the "cap" over the heated bearing. But, if he did those things, instead of what he does do, he would not demonstrate himself any more unwise than the person is who resorts to the superficial treatment of symptomatic warnings, instead of taking radical measures for the abolition of their cause, or who tries to cure serious physical ailments by the employment of temporary palliatives that at best only deaden the immediate consciousness of illness. The squeak of the dry and binding journal is in itself a small

thing, a mere noise; but it has an important significance. It gives warning of the inception of destructive conditions in the machinery. In like manner, warnings are given by nature of the deterioration of the human physical economy. A pimple is a small thing, but it demonstrates that the blood contains impurities which nature is making an effort to throw off. A headache, or a sense of languor and depression are considered trivial annoyances; but they are, really, serious notifications that our vital organs are weakened and failing. Loss of appetite may be regretted only, as it interferes with our enjoyment of the pleasures of the table; but it is Nature's way of saying: "This machine has been run beyond its capacity, and if it is not cared for will speedily break down altogether." The sensible person, who has the care for himself that an intelligent engineer has for his machine, does not neglect those warnings. He knows that such is the thorough inter-dependency among the organs of his body that no one of them can be effected without injurious secondary effect upon others, and that such effect will re-act inevitably upon the one primarily assailed. One cannot have torpidity of the liver without consequent sluggishness of the bowels and serious affection of the kidneys. And when these organs fail to do their work of secretion and excretion the blood quickly becomes laden with particles of effete matter, the waste of the system, which, being rapidly carried through all its channels, causes deterioration in every part. It is idle to think of arresting this progress by application of curative agencies to one organ only, while the others remain diseased. Their maladies must be treated together, not seriatim. You cannot get your torpid liver to work properly while your kidneys are clogged and inflamed. No medicines that stimulate the kidneys can be efficacious in curing their disorder while the liver is inactive. Purgatives that simply clear out the bowels will do no permanent good. Hence it is absolutely necessary to employ primarily a medicine that is at once a

cathartic, a diuretic, and a purgative. It is not enough to temporarily clear out the overlaid bowels, stimulate the torpid liver, and compel the kidneys to work. They must be strengthened so that they will resume the natural exercise of their respective functions, and the blood must be cleansed of the impurities already lodged in it, else they will quickly vitiate the organs again. This is where such a powerful alterative medicine as Ayer's Compound Sarsaparilla is of inestimable value. The ingredients of which it is composed (Honduras sarsaparilla, yellow dock, mandrake, stillingia, and the iodides of potassium and iron) are the most efficacious for blood-purification known to medical science. Very often a single bottle of Ayer's Sarsaparilla, taken in time, has prevented an expensive and dangerous illness, and there is no doubt that this medicine has saved many valuable lives.

ROCK CANDY.

Rock candy is simply sugar dissolved and boiled to remove all impurities, and then crystallized on strings. It naturally follows that when a very pure sugar is required, rock candy is used. Boiling sugar at a high temperature oxidizes it, and makes it of a dark color, hence when our grandfathers bought rock candy, they expected to be supplied with a brown but clear article. Since modern machinery, skill and experience have been employed in the manufacture of rock candy, the ordinary product has been a pure white, and wherever the dark brown color has been demanded, the manufacturer was compelled to color the white by the addition of caramel which is simply coloring made of burned sugar. It must be remembered that all rock candy syrups made from refined sugar, come from the pans of a yellowish tinge—a decided straw color. In order to make rock candy syrup white, it has to be carefully filtered. It is this filtering which makes it expensive,

LOOK OUT for Imitations and Substitutes OF *Horsford's* ACID PHOSPHATE.

A variety of imitations and substitutes of this standard preparation have appeared under the name "Acid Phosphate," or a similar title, all of which differ materially from the genuine article.

Be sure the name "**HORSFORD'S**" is on the label. No other genuine.

N. D. ARNOLD, TREAS.

Providence, R. I.

Rumford Chemical Works.

owing to necessary labor, material and waste. Having mastered this problem, Dryden & Palmer have the advantage of being able to offer absolutely pure rock candy syrup at the lowest price consistent with honest goods. Purchasers should beware of an alleged rock candy syrup, which is white and thick, because it is a low grade of sugar only dissolved in water, of which the market is full, and which can be sold at an enormous profit to the unscrupulous manufacturer. In making rock candy, or, as it is called in Europe, candy sugar, the finest grade of refined sugar is boiled, filtered, and then allowed to crystallize on strings. In this process, which is carried on only till about two-thirds of the syrup is crystallized, the other third being allowed to remain as rock candy syrup, for which there is a large demand, and by being thus left uncrystallized, saves re-dissolving the sugar. Of the two-thirds crystallized about one-half crystallizes in strings, the remainder in lumps. There being but little demand for these, they are generally ground up and re-dissolved for syrup. Previous to the year 1876, there was no regular manufacture of rock candy, or rock candy syrup for the market, only a very little being made by confectioners, for local use. In that year, Dryden & Palmer started the business in Baltimore, and found the demand so large for an honestly made article, that now only thirteen years after starting, the want of room, raw material, manufacturing and shipping facilities, have compelled them to remove to a large and commodious building covering a large block of ground on North Third Street and Wythe Avenue, Brooklyn. The AMERICAN ANALYST has already referred to this removal in a previous issue. In their new quarters, with entirely new and improved machinery, most of which is patented, this firm can largely increase their output, and be able to supply promptly all orders. They confine their business strictly to the manufacture of rock candy and rock candy syrup. The demand for this syrup has vastly increased

within the last decade, as it is well known to be much better in every way than simple syrup or that made from simply dissolving ordinary refined sugar. Buying in large quantities they can buy cheaper and furnish a rock candy syrup strictly pure, colorless, and warranted to keep, at nearly the same price which it would cost to make a simple syrup. They have suffered considerable from the unfair competition of one or two makers who boil common sugar and sell uncrystallizable syrup for pure rock candy syrup. Dryden & Palmer do not make any sherbets or imitation maple sugar, hence cannot supply any but the best grade of rock candy syrup. Their sales are constantly increasing. Rock candy syrup is used largely by liquor and wine men, champagne makers, pharmaceutical manufacturers, druggists, soda water syrup makers, bottlers, and also for table use. Another extensive use is that for making the celebrated *Sun* receipt for all pneumonic diseases, colds, coughs, bronchitis and consumption, which directs two ounces of rock candy to be dissolved in a pint of good copper distilled rye whiskey, a wine glassful of which is to be taken three times a day. Every one who has tried it knows the difficulty of dissolving rock candy in whiskey, and as it is necessary to have pure whiskey, it would be well not to buy the whiskey already prepared, the quality of which is not known, but to buy the best whiskey and add three ounces of rock candy syrup to the pint. Then you are sure of what you have.

BUSINESS NOTES.

CHOLERA INFANTUM.

It frequently happens that a baby, sick with diarrhoea or cholera infantum, or much reduced by digestive disturbance, cannot retain milk on its stomach, it seeming

to act as an irritant, and no hope of relief can be entertained until it is excluded from the diet. In such cases, Mellin's Food should be used with water alone, or with barley water. It may, and frequently should, be given cold; and if the vomiting be severe, a teaspoonful only should be given at one time, repeating at intervals of ten minutes. When the vomiting has been arrested the child can be allowed to feed from the bottle. After a couple of days have elapsed without any vomiting, milk in small amounts, gradually increased as the child can bear it, may be added to the diet, but with caution at first.—Doliber-Goodale Co., Boston, Mass.

HORSFORD'S ACID PHOSPHATE

In Sick Headache. Dr. W. W. GRAY, Cave Spring, Ga., says: "I have given it in several cases of habitual sick headache with perfect success."

"The Ideal Lustre"

Is a Peculiar BRILLIANCY of the TEETH, combined with a Ruddy Healthfulness of the Gums, by which you can at once detect the user of the

IDEAL FELT Tooth Polisher.

This Lustre can be obtained in no other way; and if you care for the Appearance, Smoothness and Preservation of your Teeth you will not delay its use.

AT ALL DRUGGISTS.

Its Economy. Holder (imperishable) 35 cents. Polishers only need be renewed. 18 (boxed) 25 cents. Dealers or mail.

A BUSINESS BENEFIT.

ADVANTAGES TO ADVERTISERS OFFERED BY THE AMERICAN ANALYST.

It has not the limitations of a daily paper. No one reads yesterday's paper. A monthly lives at least a month, while a semi-monthly is fresh twice a month, and its audience is not limited by geographical lines, but the circulation is all over the United States and Canada.

It contains matters of interest to everyone, especially the ladies of the household, and is, therefore, sure of a careful perusal. Our audiences are intelligent and of the better classes, who have money to spend, and any well worded advertisement in our columns, giving real information, will receive a careful perusal.

Our rates are as low as our circulation affords. Large circulation and original matter cost money, and those advertisers who desire to realize these benefits must expect to pay reasonably for them.

Advertisements in our columns are permanent. Most of our subscribers bind their numbers.

Our advertisements are set up in an attractive form, sure to call the attention of the reader.

Anything that our readers want, or for which a demand is to be created, not wholly of a local nature, will pay to advertise with us.

We take only advertisements from legitimate houses of really meritorious goods, and give them all the editorial assistance they deserve; consequently our readers knowing this, have confidence in advertisements contained in our columns.

♦ The fact that we have the best and largest houses in every branch of trade advertising with us, and that they always renew as their seasons arrive, proves beyond a doubt that they have found the AMERICAN ANALYST a good advertising medium. Why should not you?

If you Value
**Clean Homes
and Clean Clothes**

If you have any feeling for the poor souls who make them so, lighten their tasks by supplying them with

Pyle's Pearline Washing Compound.

You will have better results, happier servants—they will have more time for rest or other work. Your clothes will not be rubbed to pieces. You will not be under any increased expense, and you will have taught your help to use their heads in the right direction, rather than their muscle in the wrong. Give Pearline a fair trial *without soap* or any other preparation. Millions are using it. Beware of imitations and peddlers.

Sold everywhere. Pearline is manufactured only by JAMES PYLE, New York.

MALTINE

MALTINE is far superior in nutritive and diastatic value to any Malt Extract manufactured in the World. There is no re-constructive that excels Maltine in Phthisis and many wasting Diseases.

MALTINE in its different forms is the only malt preparation we now employ, being so palatable, digestible, and easily assimilated. Of its efficiency in appropriate cases there is no more doubt in our minds than there is of the curative power of Quinine, Cod Liver Oil, the Bromides, and the Iodides.

It deserves to stand in the front rank of constructives, and the constructives by their preventive, corrective, and curative power are probably the most widely useful therapeutical agents that we possess.

PROF. L. P. YANDELL.

MALTINE is a valuable food, a food of priceless value at times of emergency. In fact, in very grave gastric cases it is a food which may be often resorted to when at one's wits end what to do.

J. MILNER FOTHERGILL.

Out of 14 trade samples of Malt Extract examined by Messrs. Dunstan & Dimmock, only three possessed the power of acting on starch. These brands were MALTINE, Gorbun, Stacey & Co.'s Extract, and Keppeler's Malt Extract. WILLIAM ROBERTS, M.D., F.R.S.

I have subjected "Maltine" and all other leading "Extracts of Malt" to an exact quantitative comparison of their diastatic activity.

The results demonstrate conclusively the far greater diastatic value of Maltine, and enable me to state, without any qualification whatever, that it far exceeds in diastatic power any of the six preparations of Malt which I have examined.

R. H. CRITTENDEN.

Professor of Physiological Chemistry in Yale College.

At the International Health Exhibition held in London, England, the only gold medal and the highest award of merit were given to Maltine by a Jury composed of the best chemists in Europe, and recent analyses made by the most reliable authorities in Europe and America prove conclusively that Maltine—in nutritive and diastatic value—is superior to all other malt preparations now in the market.

NOTE.—Physicians will observe that Maltine, as now prepared, is not so viscid as formerly made, being of a more fluid consistency; and, while retaining the nutritive and diastatic value which has given it precedence over all other Extracts of Malt, it is rendered entirely agreeable to the taste of the most fastidious, and is more easily administered. As now prepared, we positively guarantee that Maltine will not ferment or coagulate in any climate or at any season of the year.

COMPLETE LIST OF MALTINE PREPARATIONS.

MALTINE (Plain).	MALTINE with Phosphates, Iron
MALTINE with Alteratives.	Quinine, and Strychnia.
MALTINE with Cod Liver Oil.	MALTINE Ferrated.
MALTINE with Hypophosphites.	MALTO-YERBINE.
MALTINE with Peptones.	MALTO-VIBURNIN.
MALTINE with Pepsin and Pancreatine.	MALTINE with Cascara-Sagrada.

Physicians may obtain Maltine from all druggists in every part of the world. In cases where the physician intends to prescribe Maltine, the word "Maltine" should be written, and not simply the words "Malt Extract," or "Extract of Malt."

Send for Pamphlet giving comparative analyses by 100 of the best Analytical Chemists in this country and Europe.

We will be happy to supply any regular practitioner with eight ounces each of any three Maltine compounds that may be selected from our list, providing he will agree to pay express charges on same.

COLDEN'S

ORIGINAL LABEL:
"Colden's Liebig's Liquid Extract of
Beef and Tonic Invigorator."

LIQUID

BEEF TONIC.

AN INVALUABLE AID IN THE TREATMENT OF
ALL CASES OF DEBILITY.

Established 15 Years. Endorsed by Scores of Physicians.
Essentially Different from all other Beef Tonics.
Beware of Imitations.

COLDEN'S LIQUID BEEF TONIC consists of the Extract of Beef (by Baron Liebig's process), spirit rendered non-injurious to the most delicate stomach by extraction of Fusel Oil, soluble Citrate of Iron, (inchona, Gentian and simple aromatics. An official analysis of this preparation by the eminent chemist ARTHUR HILL HASSALL, M. D., F. R. S., and an endorsement by SIR ERASMUS WILSON, F. R. S., is printed on the label of each bottle.

Its Range of Action Embraces all Cases of Debility.

By the urgent request of several eminent members of the medical profession, I have added to each wineglassful of this preparation two grains of SOLUBLE CITRATE OF IRON, and which is designated on the label as "No. 1," while the same preparation, without Iron, is designated on the label as "No. 2."

It acts directly on the sentient gastric nerves, stimulating the follicles to secretion and gives to weakened individuals that first pre-requisite to an improvement, an appetite.

I will, upon application, send a sample bottle of Colden's Liquid Beef Tonic to any physician in regular standing. Please ask your Dispensing Druggist (if he has not already a supply) to order it. In prescribing this preparation physicians should be particular to mention "COLDEN'S" viz: "EXT. CARNIS. FL. COMP. (COLDEN)." It is put up in pint bottles and can be had of Wholesale and Retail Druggists generally throughout the United States.

IMPROVING THE DIPLOMA SYSTEM.

The custom of awarding medals and certificates at public Fairs has been carried to such an absurd extreme as renders it probable that the system will be abandoned. At the International Exhibition in Paris, the authorities have not yet decided upon the plan to be adopted as to jury examinations of exhibits, or as to reports and awards; nor indeed is it by any means settled whether there will be any juries, reports, or awards at all. There will be no distribution of medals, the utmost that would be done being the possible giving of diplomas of different shades of merit. The chances appear in favor of a total abandonment of the jury and award system, and in its place the substitution of an official document given to every exhibitor, certifying his presence at the exhibition. The object of such a certificate does not appear very clear. If the decision be taken, to follow the example that has been set in England, and abandon all attempts to pronounce on the respective merits of exhibitors, the present exhibition offers a splendid op-

portunity for a new departure in official recompense. The idea submitted by a member of the British Committee is receiving attention. It is that, awards, in the form of medals or diplomas, should be given to those men whose names are famous in industry and science, and whose works have been so distinguished that the fruits they have borne appear in all parts of the exhibition, though the distinguished workers themselves take no part. The number is limited, and the list would not be difficult to prepare, for the names of such men are familiar to all the world. Pasteur, Chevreuil, Dumas, Gramme, Eiffel, De Lesseps, Bessemer, Wyld, Swan, Armstrong, Edison, Bell, Alvan Clarke, are conspicuous examples of those whose labors have advanced civilization in all its branches. So, too, those societies all over the world, whose mission it has been successfully to promote industry and science, could be appropriately recognized.

THE OBSTRUCTIONISTS FLOODED.

According to the *Produce Exchange Bulletin* of this city, the "local inspection" law in New Mexico has been quickly knocked out. That paper states that in a long opinion given to the meat inspector of Santa Fe County, relative to the new law regulating the sale of meats and providing for the inspection of cattle and hogs prior to slaughtering, which practically prohibits taking into New Mexico dressed beef and pork, the acting solicitor-general of the Territory says that the act is unconstitutional and void so far as it affects shipment into the Territory for purposes of sale and public use of articles of interstate commerce. He holds that dressed beef and pork are commodities of this character, and that the law is an attempt, under the cover of police power, to keep out all foreign dressed or uncured meats. We have not seen any announcement of the foregoing fact elsewhere than in the *Bulletin*, but inasmuch as such an outcome as it records is inevitable, we presume the statement is correct.

THE HIGHEST BUILDING.

That the Yankees "beat all creation" is well established, but their attempt to accomplish that feat in the Washington monument has been so far eclipsed by the progressive Frenchmen in the Eiffel tower at Paris, now about completed, that there is no room left for brag. It stands to-day as the highest structure ever built by man, and with the exception of the Tower of Babel, is probably the highest building ever contemplated. Its total height is 1,178 feet, more than 500 feet in excess of the Washington monument, which was previously the highest building in existence. This remarkable monument originated in the brain of the French engineer Eiffel, and it is intended to be a feature of the Paris Exposition, and also a permanent reminder of it. It is situated on the banks of the Seine, opposite the Trocadero Palace, and is constructed of iron girders. Seve-

ral elevators will carry passengers to the top, the trip occupying five minutes. A spiral staircase also leads to the top, which it will require forty minutes to mount. There will be a restaurant on the first floor, which is on a level with the towers of Notre Dame. An electric light of marvellous power will flame from the summit. It is claimed that a newspaper can be read by its light at a distance of seven miles, and that the light itself can be seen for forty miles.

AMERICAN VINES ON EUROPEAN SOIL.

The alleged resistance offered by American grapevines to the ravages of the phylloxera has recommended those vines to wine-growers of Europe, where the pest has made its presence felt. Much uncertainty has existed among the growers as to the particular variety best adapted to resisting the insect ravages, and some disagreement has also been noted between those who favored grafting American cuttings on French vines and those who proposed to replace the French by the American article entirely by planting the latter in the place of the former. Dr. Geza Von Horvath, of the Hungarian experimental station, who has been studying the subject for seven years past, has published in detail the results of his experiments, recently referred to in *Bradstreet's*. There is but one American variety, and that the *Vitis rotundifolia*, or Scuppernong, that will successfully resist any and all attempts of the pest upon its roots.

MICROBE ENTHUSIASTS.

The discovery of the diphtheria microbe is reported from Paris, with a vague promise of an expedient for inoculation against the disease. Similar identifications of the cholera, yellow fever and many other microbes have not involved the development of preventive measures for the protection of human life. The promise of an effective method of inoculation against diphtheria will probably prove equally illusory. Medical enthusiasts may entertain the pleasing fancy that the time is coming when all the microbes will be known, numbered and provided with symmetrical Latin names, and the human species adequately protected against everything except old age. An ailing and disconsolate world remains incredulous.

CIGARETTE LEGISLATION.

On April 11th the lower house of the Michigan Legislature passed a bill which prohibits the "manufacture, sale, keeping for sale or giving away of any cigarettes or any imitation thereof composed in whole or in part of tobacco, or any substance in the form of the cigarette containing any narcotic elements." That is pretty sweeping. In New York it is only proposed to forbid the sale of cigarettes to boys under sixteen. The Michigan House may mean well, but it is hardly likely that public senti-

30 Shaves

for 2 Cents.

Send a two cent stamp to Colgate & Co. 55 John St., New York, who will mail you a sample of this superior soap sufficient to last a month,

ment will support any such law as that. A sentence of banishment against the cigarette in toto cannot be enforced at the present day. But a great benefit to the American manhood of the future will be effected if its pernicious use by minors can be prevented.

COOKING IN EMERGENCIES.

HOW THE CITIZENS OF PARIS FARED DURING THE SIEGE.

No one knows till stern necessity taps at our doors, and when starvation looks us in the face, what dishes can be made out of things one has never dreamt of before. In a pamphlet called, "The Beleagured Cook; or, the Art of Living in a Besieged Town," there are some very interesting facts of the kind. This work emanated from the pen of one who was through all the horrors and atrocities of the siege of Paris. Hunger all through the siege was one of the deadliest enemies the French had to combat with. He writes that "during the almost general hecatomb of all created animals, we may mention oxen, sheep and pigs which lasted till November * * * the horse was the best and most delicate food; the dog supplied flesh both agreeable and healthy; the cat, and even the rat, adorned our tables; * * * but little did anyone suspect that dromedaries, antelopes, the elephant, and others, which we had for years visited in the Jardin des Plantes, would one day appear on our tables as welcome entrees." After the siege, "the ass must, by the delicacy of its flesh, become the favorite of the rich. Its meat is firm, close-grained, and pleasing. Much more delicate than beef, it can be cooked in exactly the same way." One of the favorite siege soups was "Soupe à l'Ail," made by putting thin slices of bread into a tureen, and adding olive-oil, onions, pepper and salt. Boiling water was poured on this, and a clove of garlic was scraped in for each person. Roast cat was another favorite dish. "The Beleagured Cook" says: "Its flesh is white, fine and delicate. Before it is eaten, however, it wants to be kept forty-eight hours. You can make a ragout of it as you would of hare, and roast it." The cat was cooked in a casserole with dripping, onion, garlic, pepper, salt, sweet herbs, and a wine-glass of wine or gravy, cooked slowly. He also writes: "Horseflesh is very much like beef in appearance and taste, and, well cooked, it is difficult to discover the difference, and, if anything, it is to be preferred to beef." Pot-au-feu de cheval was made by taking the flank skin and neck, and putting it into cold water, cooking it over a slow fire, and removing the scum as it rose; a clove of garlic, a burnt onion, a few cloves and leeks, celery, turnips, cabbage, etc., were

added. This took seven or eight hours' slow cooking. Cheval à la Parisienne was another favorite way of cooking horseflesh. The recipe was to take horses' oil, heat it, and add boiled horse in slices, with salt and pepper to taste. When half cooked, stock and parsley were added, and shallots and vinegar. Horseflesh ragout was made by browning some fat in a frying pan, and adding to it a fillet, the tongue, heart and brains, all cut up small. This was half-dried, then floured, and a glass of wine added, as well as water, herbs, pepper, salt and chopped garlic. When nearly cooked, onions were added. Asses brains were very much esteemed. They were washed in tepid water, and then soaked for an hour in cold water, then put into stock and seasoned with salt, pepper, garlic, thyme, carrots, a bayleaf, and some vinegar, and cooked for forty-five minutes. When cooked they were served with black butter sauce. Our "Beleagured Cook" tells us that dogs were hung forty-eight hours, when it was difficult to tell it from the mutton, and if put into a marinade for a few hours it tasted like kid. A leg of dog, after being hung for four days, was marinated, with a clove of garlic under the knuckle, then roasted before a brisk fire, and well basted with the marinade gravy. Rats' flesh had to be carefully inquired into before cooking, as dangerous germs were often found in their bodies; it was always well spiced before being cooked.

HOT-AIR BATHS.

THE TESTIMONY OF PHYSICIANS AS TO THE VALUE OF THE TURKISH BATH.

Dr. Austin Flint says that, as a remedy for sleeplessness, the Turkish bath is better than bromides, chloral, or opiates. Dr. Lewis Sayre says that when the medical profession arrives at a thorough knowledge of the value of hot-air baths, they will prescribe them more frequently, and medicines less, and be of more service to their patients. Dr. L. W. Thudichum, of London, thinks the Turkish bath the most powerful and certain, and at the same the safest and most agreeable therapeutic agent in existence. He says one can remove as much of the poisonous and effete matter from the body in one hour in a Turkish bath as can be removed by other means in twenty-four hours, and that it is a common experience that persons who have been liable every winter to attacks of catarrh, bronchitis or neuralgia, acquire an almost perfect immunity by the regular use of the bath. Sir Benjamin Brodie, M. D., of London, says it is of great use in dyspeptic and gouty diatheses, and to those who lead inactive or sedentary lives. Professor Erasmus Wilson, says that in the Turkish bath the skin acquires color, freshness, firmness and elasticity; it loses the muddy and faded hues of ill-health, and the parched and wrinkled aspect of infirmity and age, and that it procures for the habitual bather exercise, health and life. Sir John Fife, M. D., of Edinburgh, who was the first to establish a bath in connection with a hospital, at the great Newcastle Infirmary, says that its effects are most remarkable in obviating disorders and palliating diseases of the liver and kidneys, the relief of kidney obstructions often occurring almost immediately after the use of the bath. These quotations show that many of the leading physicians of the world are firm believers in the therapeutic value of this agent. It is roughly estimated that there are seven million pores opening on the surface of the skin. These are the vent holes, or sluice gates, for over twenty-five miles of drainage. To insure health, it is necessary that the greater part of this system of drainage should be in proper working order. If the sluice gates are blocked up, the waste matter must find an outlet in some other quarter, and naturally it permeates the tissues of the body, enters the blood currents and produces diseases of various kinds. The Turkish bath, by opening the pores, by flushing and allowing free egress to this deleterious matter, cleanses the blood from impurities, gives an impetus to the circulation, and

invigorates the entire organism. It is one of the best remedies for relieving a "general cold," and it acts well as a mild febrifuge. Unlike many rules, the Turkish bath works both ways: it will reduce superfluous tissue, and, by its action in restoring the system to a normal condition, it will also increase the bodily weight.

CHEAP JELLY.

THE PURE FRUIT ARTICLE REJECTED FOR CHEAP IMITATIONS.

The Oswego Times tells the following instructive story about the altogether too common nasty imitation jellies: A year or two ago a man in the town of Oswego found himself with a large crop of red currants, and as the price in the market was too low to permit him to sell them at a profit, he manufactured them into "jam" or "jelly," using the best of sugar, and producing a most excellent article which he imagined would sell to families and hotels readily. He found the hotels supplied with a cheap, impure article, manufactured from gluten and acids, and colored to resemble somewhat in color and taste currant jelly, which the landlords told him answered every purpose, as the boarders didn't know the difference, and it could be procured at a much lower rate than he could afford to sell the pure article. The dealers would not purchase the pure article because they sold at retail an article which "answered the purpose," even lower than he could offer his at wholesale. The result was the enterprising man, who thought he could do the people a great kindness by furnishing them with a pure, delicious article of currant jelly at a cost less than they could manufacture it themselves, had a large quantity on hand to send to friends, and to pass around "in case of sickness," etc. But we haven't heard of his manufacturing any more "pure currant jelly" for the market.

POISONOUS CANDLES.—At a children's party in London, last Christmas, a number of the little guests, as well as several of the adults, were seized with curious and inexplicable symptoms, which could not be traced to the indigestion of any particular food or liquid of which they had partaken. Attention was then drawn to the candles on the Christmas tree, many of which were green, and these, when submitted to analysis by the county analyst, proved to contain Scheele's green, the red candles, moreover, being colored with vermilion.

THE SALT OF THE EARTH.—The world's annual production of salt is approximately 7,200,000 tons. Of this the United Kingdom produces 2,200,000 tons, North America 1,000,000 tons, the continent of Europe 3,000,000 tons, and Asia and Africa 1,000,000 tons. The consumption of salt varies from 50 pounds per capita in the United States to 8½ pounds in Switzerland. In England 40 pounds per head is the average. In France it is 30 and in Italy 20 pounds per head.

TO UTILIZE STREAMS.—A new method of utilizing the power of running streams has been devised by M. Tain, a Russian engineer. His apparatus consists of an endless cable carrying a series of canvas cones, which open and shut like an umbrella. The cable passes over a double drum on board a pontoon, and at the other end over a pulley suspended from a buoy. On the lower part of the rope the cones are opened and forced forward by the current of water, thus setting in motion a shaft or drum.

COMPOSITION OF HONEY.—R. Bensemann has analyzed a sample of pure honey taken direct from the bee-hive. It was quite colorless, transparent, and showed no traces of crystallization. Its taste was very sweet, and its odor somewhat aromatic. It gave a rotation of the beam of polarized light to the right (3.74 deg.) It gave to analysis: water, 22.61; Levulose and dextrose, 64.33; saccharose, 12.59; and ash, 0.09; total, 99.62 parts. The presence of saccharose (cane-sugar) in this honey, to the extent of over 12½ per cent., is attributed by the author to the fact that the bees collected in fields near to a sugar refinery, and doubtless many of them visited the latter.

ICE WATER.

SOME POPULAR IDEAS ON THE CHEMISTRY OF FREEZING.

The exceptionally mild winter this season has not been very favorable to the growth and harvesting of the New England ice crop, which, in many localities, is more important than the product of the land in the summer. The seasonable cold of the latter part of the winter, however, caused the "growth" of a fair crop in most localities, and there is no danger of a scarcity next summer of an article which has now become almost a necessity of life during hot weather. The freezing of water is such a common and familiar phenomenon that we do not often stop to think of the remarkable effect which a low temperature produces in changing a liquid into a hard, brittle solid, of a different specific gravity, and which, with the exception of being composed of the same chemical elements, is, practically, a new substance. The true nature of this change, which we call a physical one, we cannot fully understand, and it may not be going too far to question whether the difference between ice and water is altogether independent of the chemical composition, and whether the so-called elementary constituents—hydrogen and oxygen—are not individually modified also. This, however, leads us to the question of the true nature of elements, of which at present we have very little knowledge. Water in freezing passes at once from the liquid to the solid state, without any intermediate condition of softness and plasticity, as is the case with glass, iron, and many other substances. One moment it is water—but, in an instant, a needle-like crystal shoots across the surface, and a portion has been transformed into ice. Water, also, is one of the few substances which is lighter in the solid than the liquid state, and this property is one of the most important principles in Nature, for, if the ice were heavier than water, and sank to the bottom as fast as it formed, in a few years all our lakes, ponds, rivers, and probably the polar oceans themselves, would become solid masses of ice, which the summer's sun would be unable to melt. If we cool water from the boiling-point (212 deg. Fahr.) to the freezing-point (32 deg.), we shall set free, as it were, 180 deg. of heat. Now if we continue the cooling till the water is frozen, we find that the thermometer still indicates the same temperature of 32 deg., but an additional quantity of heat has been set free from the water in the process of changing to ice, and investigators have found that 142 deg. of heat are thus set free; and, conversely, when the ice is melted again, the same amount of heat—which is called latent heat—is absorbed in the process of liquefaction, before the thermometer begins to show any change of temperature. That is to say, in order to transform a pound of ice at 32 deg. into a pound of water at 32 deg., we must use as much heat as would raise a pound of water from 32 deg. to 142 deg., or much more than half-way to the boiling-point. Making a more practical and familiar application of these figures, we find that a pound of ice can reduce the temperature of three pounds of water from 80 deg. to 32 deg., and we thus see how important a matter this latent heat of ice becomes, for, if it were not for this absorption of heat, the pound of ice would only reduce the three pounds of water from 80 deg. to 68 deg. After ice is once formed it follows the same laws of heating and cooling as any other solid. A popular magazine once stated that the lower the temperature at which water was frozen, the colder would be the ice. This is only true in an extremely limited sense. If a piece of ice formed at a temperature below zero, is exposed to a temperature above 32 deg., the temperature of the whole mass rapidly rises to 32 deg., just as a piece of stone or iron would, but at that point liquefaction and the absorption of latent heat begins, and the full cooling power of the ice is exerted. Not until the last particle is melted will the temperature rise above 32 deg., and all ice is equally "cold," whether it is formed at a temperature one or a hundred degrees below the freezing-point. A simple experiment, to show this absorption of latent heat, can be performed by tak-

ing two glasses, one containing water mixed with broken ice, and the other water cooled to 32 deg. by a piece of ice, which is removed before commencing the experiment. A thermometer immersed in each will indicate 32 deg. Set both glasses near the stove, or in a very warm place, wait till the ice in the first glass is nearly melted, and then take the temperature again. In the glass containing water only it will be found to have risen several degrees; in the one containing ice and water it will still remain at 32 deg. Both have received the same amount of heat, but in one case it has been absorbed by the ice in melting and rendered latent, without raising the temperature of the liquid. From the above facts it will be seen that ice alone can never freeze anything brought in contact with it. It will only reduce its temperature to 32 deg., and there the action stops, for, as no more ice can be melted at that temperature, no more heat can be absorbed from the body in contact with it. If we force the ice to melt at a lower temperature, by the addition of chemicals—such as salt, for instance—more heat will be absorbed by it, and any liquid or solid in contact with it will be frozen, as is illustrated every day in the preparation of ice cream. A large number of such "freezing mixtures," as they are called, are known to chemists, some of which—like nitrate of ammonia and water—do not require any ice at all. Ice is a crystalline body, and almost invariably crystallizes in hexagonal, or six-sided, forms. It is claimed that it sometimes forms crystals of the trimetric system, but the observation has not been confirmed. This crystalline structure is not very evident in a mass of ice, unless one observes it when water first commences to freeze, but it is beautifully shown in a snowflake, as well as by the frost-work which forms on window panes in winter. This law of crystallization extends through nearly all inorganic forms of matter, and not the tiniest snowflake falls to the ground, without being shaped by the same mysterious forces which have given a definite structure to the rocks of entire mountain-chains, or even to the solid crust of the earth itself.—*Pop. STALE BREAD.

HOW TO UTILIZE THE WASTE SCRAPS AND CRUMBS.

With a little care on the part of the cook or housekeeper, every scrap of stale bread can be made available. All the crusts and small pieces should be placed in a pan, and dried slowly in a warm oven. When they are perfectly dry, put them into a small bag made of ticking or canvas, and pound them fine with a wooden mallet. Sift them, and put them in glass jars. They will keep for months, and can be used for breading meat, fish, croquettes, etc. Another way of using these dry scraps is to roll them until they break in rather coarse crumbs. They are then nice to eat with a bowl of milk, for instance, or tea. Cut all the crust from a loaf of bread, and then tear the loaf in long, thin pieces. Spread these in a large pan, only one layer deep, and place in a hot oven. When they are crisp and brown, which will be in six or seven minutes if the oven be very hot, send them to the table with thin slices of cheese. This dish is nice just before dessert. Frequently it is served with the coffee. Take a number of slices of dry bread. Dip them quickly one by one in a bowl of cold water. Place them in a large dripping-pan, having only one layer at a time. Then set the pan in a hot oven. In ten minutes the bread will be brown and crisp. Place on a warm plate, and cover with a warm napkin. Serve at once with a little broiled smoked salmon, or any other smoked fish. This dish is a good one for lunch or supper. Put a loaf of stale bread in a deep pan, and after covering it with another pan, set it in a moderately-hot oven for twenty minutes. At the end of that time, take it from the pan and set it on end to cool. This bread will cut like a fresh loaf. Cut all the crusts from a loaf of stale bread, and put the loaf in a steamer. Set it over a kettle of boiling

water for twenty minutes, and serve at once with a sauce which has been made in the meantime by the following recipe: Put three cupfuls of boiling water in a stewpan, and place the pan on the stove. Mix three tablespoonfuls of flour with half a cupful of cold water, and stir the mixture into the boiling water. Continue stirring for two minutes. Now add half a nutmeg (grated) the yellow rind of a lemon (grated), and also two cupfuls of sugar. Boil for twelve minutes, then add two tablespoonfuls of butter, and the juice of the lemon. Cut the steamed bread in slices with a sharp knife, and pour a generous supply of sauce on each side as it is served. This is a nice sweet dish for children.

BLOOD ORANGES.

NOT GRAFTED FRUIT, BUT THE RESULT OF CULTIVATION

"There are more blood oranges in the market this Spring than I ever knew before," said a wholesale fruit dealer, "and there seems to be a constant demand for them." What people can see in them that is especially fine I have never been able to discover. To me they are as insipid as grape fruit, and that is a fruit about as utterly insipid as anything can well be. It was formerly the universal belief among lovers of the blood orange, and a great many believe so yet, that the fruit was the result of grafting the orange and the pomegranate, but that is a fable. The blood orange is simply a variety of the common sweet Manilla orange, and it originated a century ago by peculiar cultivation of the ordinary orange by a Spanish fruit gardener of the fertile Philippine Islands. Its novelty of color in pulp gained it great popularity, and not only the fruit but the trees it grew on commanded immense prices in the markets of Europe. The blood orange supply formerly came almost entirely from Manilla, and was for years one of its chief articles of export. Malaga now almost monopolizes the trade. Philadelphians seem to be the greatest lovers of the blood orange in this country, as the dealers of that city are the largest importers of the fruit."

FISH FOR FOOD.

SOME SIMPLE RULES FOR THEIR CHOICE AND SELECTION

The selection of fish is of the first importance, as upon its condition depends its healthfulness as well as its flavor. Leave this as little as possible to the fishmonger, or servant, unless well convinced of the honesty of the one, and the good judgment of the other. To a certain extent, modern facilities for keeping have rendered it possible for us to have a fish which is entirely out of season upon our tables in excellent, if not perfect, condition. This is, however, only for the rich, the poor, and moderately well to do, must content themselves with the luxury of absolute freshness. There are a good many ways of judging of this, which apply to fish in general. Soon after it is caught *rigor mortis* sets in, and the fish becomes firm and flexible; this after a time passes, when it becomes pliable and flabby. You may then be sure that it has passed perfection, even if it has not become spoiled. The gills of a fish fresh caught are red, and the eye round and bright. Reject at once and relentlessly the fish from which the eyes have been removed, as there is no more certain sign of the stale fish, and also of the dishonest tradesman. Lobsters may be judged by the state of the eye, and if the small purse-like appendages spring into place on being lifted the fish is fresh; the tail also will be springy. In selecting, the male lobster is considered better; it may be known by its narrow tail and greater number of claws. The female, however, contains the eggs, which are desirable for sauces. Heavy lobsters are better than those of medium length. This same length is now decreed by law, fortunately for our fast decreasing supply, and "short" lobsters are an illegal article of commerce. A lobster should not be eaten if

over eighteen hours out of the water, and it deteriorates rapidly after the first six. Canned lobsters and shrimps are among the best of all canned goods, but care is needed in selection here also. The condition of the contents may be judged from the appearance of the can; it must be perfectly air tight, if not so, the can will at once proclaim it by bulging at the ends; this shows that gas is being generated within, and this same gas is the result of decomposition; the contents being good, will be known by a level or a little depressed surface. This is true of all canned goods. Lobsters, salmon, shrimps, and so forth which are bottled, are more expensive, but there is less danger than with tinned goods. Oysters and clams, when removed from the shells, may be called fresh, in ordinary winter weather, for the larger part of a week, but they soon lose their best flavor, and for perfection cannot be eaten too soon. Never fail to discard a broken clam before cooking, for you cannot know when the shell was shattered, and the blow will have killed the fish. The food of some fish largely influences its flavor; with fresh water fish, as perch, pickerel and fresh water eels, this is apparent in their somewhat muddy taste, which is thought in its favor by some people. An untempting reputation for voracity is attributed to the lobster, but he does not deserve it; on the contrary, he is a small eater, and shuns impure things as a food, although he is a curious gentleman and investigates everything he finds upon the bottom. The cod is far less particular, and will, indeed, help himself to almost anything, which makes him more desirable when caught off a rocky headland or some way "off shore." The eel, though an untempting fish to many people, is yet a fastidious one, and he is so neat in his table habits as to reject contemptuously the trap, however well baited, which has not been washed and sunned before setting. The blue-fish, though one of the most toothsome when in perfection, which it never is except very near the sea, is not worthy of his title of "scavenger of the ocean."

—Good Housekeeping.

"LIMITED."

THE MEANING OF THE WORD APPLIED TO CORPORATIONS.

Many people are unaware of the significance of the word "limited," following the title of a corporation, and even those who are fully posted in regard to the liability limits of the shareholders in a corporation having that word attached to its name, will find the facts below of interest. The old principle of corporations created by legislative act was that the entire property of every stockholder was liable for the whole debts of the whole company, as the whole property of every member of a general partnership is still liable for the debts of the firm. This system made every shareholder responsible for bad management of which he might not be guilty, and deterred wealthy men from becoming interested in the shares of corporations. To remove this objection the principle of limited was introduced, and in order to notify the public that only the separate property of the corporation was liable for the debts of the corporation the English law requires that the word "limited" shall be used in every case by the company. Most American corporations are constituted on the principle of limited liability, but few, if any, of the States enjoin the companies to append the word limited to their corporate titles. The matter is so generally understood in this country, however, that it is not necessary. The most noteworthy exception to the general rule is the case of the national bank, and even in this instance liability is limited to an amount equal to the par value of the shares. That is, if the national bank fails, each stockholder may not only lose what he has invested, but \$100 more for each share of stock he holds, if so much is necessary to pay the debts of the bank. Until within a few years all the Scottish banks were organized with unlimited liability, and when, eight or ten years ago, a Glasgow

bank failed disastrously, there were cases of men who only owned a share or two, valued before the failure at not much more than \$100 each, who were assessed thousands of pounds sterling to meet the debts of the bank. Since that time the Scottish banks have been allowed to reorganize on a limited liability basis.

REVIEWS OF NEW BOOKS.

A LABORATORY GUIDE IN CHEMICAL ANALYSIS, by David O'Brine, E. M., Professor of Chemistry in the Colorado State Agricultural College. New York: John Wiley & Sons.

This work, of which the present is the second edition is intended, the author informs us, for the use of students who possess some knowledge of chemistry. The object is to present a practical guide in chemistry adapted to the wants of the college or the medical laboratory. It would be impossible to acknowledge the source of all analytical details or methods; they have been used, and in most cases modified by so many different persons that they are now regarded as common property. The labors of many well known chemists have been laid under contribution. Some of the methods are original, and every test presented has been verified. There is a discussion of all that is important in the analysis of water, milk and cheese, blood, urine and poisons. Especial attention is invited to the following subjects: Separation of Bases and Tests; Comparison of Phosphorus, Arsenic and Antimony; The Organic Acids; Classification of the Alkaloids; The Ptomaines; and Stoichiometry.

DIGEST OF LAWS GOVERNING THE ISSUE OF MUNICIPAL BONDS. Chicago and New York: S. A. Kean & Co.

Messrs. S. A. Kean & Co., whose New York office is at 115 Broadway, have recently published a new and revised edition of their "Digest of Laws" governing the issue of Municipal Bonds, which cannot fail to be of interest and value to investors, including savings banks, insurance companies, estates and individuals. It will also be valuable to authorities of states, counties, cities, school districts, etc., who contemplate issuing bonds. This book will be more valuable from the fact that Messrs. S. A. Kean & Co. have had more than twenty-five years experience as bankers and dealers in investment securities.

HAND-BOOK OF MATERIA MEDICA, PHARMACY AND THERAPEUTICS, by Cuthbert Bowen, M. D., B. A. Philadelphia and London: F. A. Davis.

The purpose of this work and, one for which it appears to be admirably adopted, is to furnish candidates for examination in the medical schools of this country a condensed recapitulation of the points on the themes mentioned in its title, with which they must be familiar in order to commend themselves to their examiners. All the drugs recognized by the United States Pharmacopoeia and their official preparations have been treated of in detail, special stress being laid on those points which in the past have proved stumbling-blocks to the candidate in the examination room. The form of a question-and-answer book has been adopted as admittedly the best means of conveying the greatest amount of knowledge in the fewest words. In the majority of instances the original form of the questions as submitted to examiners has been retained. While this is essentially a student's manual, a large amount of matter has been incorporated which, it is thought, will render it a useful reference-book to the young graduate who is just entering on his professional career, particularly the individual whose sphere of work demands a more practical acquaintance with pharmaceutical processes than is required of the ordinary city practitioner. Great care has been taken throughout the book to familiarize the student with the best methods of admin-

istering the various drugs he will be called upon to use, and with this object a large number of standard prescriptions have been selected from the works of the most eminent authorities, which he can either adopt with modifications to suit particular cases, or use as models on which to construct his own formulae.

THERAPEUTIC REFERENCE BOOK. Philadelphia: W. R. Warner & Co.

This is a convenient little reference book for medical practitioners containing in alphabetical arrangement, prescriptions of leading physicians for almost all the common ailments that humanity is subject to. It is not designed to teach those for whose use it is prepared anything they do not, or should not, already know, but as a handy pocket *vade mecum*, for refreshing the memory it will doubtless prove of great utility.

DOMESTIC DIETETICS.

SPECIALLY PREPARED, FROM PRACTICAL TESTS, FOR THE LADY READERS OF THE "AMERICAN ANALYST."

SEASONABLE FOOD.

May.

MEATS.—Beef, lamb, mutton, ham, kidneys, liver, sausage, veal.

GAME AND POULTRY.—Brant, pigeon, chicken, duck, turkey, goose, snipe.

FISH.—Anchovy, bass, catfish, cod, eels, clams, flounder, halibut, herring, lobster, mackerel, mussels, perch, porgie, rock-fish, salmon, shad, shrimp, turtle, trout, sturgeon, whiting, weak-fish.

VEGETABLES.—Artichokes, beans, carrots, garlic, lettuce, onions, parsley, parsnips, potatoes, shallots, spinach, turnips, water cress, radish, rhubarb, sea kale.

PRACTICAL RECIPES.

MRS. CHAPIN'S BUNS.—One quart warm water; one quarter pound butter; half teacup yeast; add enough flour to make soft dough, and set to rise three or four hours. Beat four eggs, half pound sugar, a teacup of currants, and mix with the dough and let rise again for two hours. When very light, make the dough into small buns. Set them close together in tin pans and let them rise, and bake in rather a quick oven. Before baking, brush over the top with milk and molasses.

PUREE OF SPLIT PEAS.—Soak one pint split peas over night; try out two slices of bacon cut into small pieces; in the fat fry a small onion, chopped up fine until it is brown; to this add a pint of hot water or clear soup, and season with a few stalks of celery, a small carrot shredded, salt and whole black peppers, and a few sprigs of parsley; simmer an hour, and turn the contents of the pan into three pints of soup-stock; add split peas. Simmer gently until the peas can be easily mashed between the fingers; taste for seasoning; add more salt and pepper if necessary, and a saltspoonful of brown sugar. Take the saucepan off the range, and pour the soup and rub the pulp through a sieve; return to the fire, and add a teaspoonful of wet flour. Whisk the soup thoroughly, and let it stand on the back of the range to keep hot until wanted. It will be better if made an hour or so before dinner.

COCOANUT CANDY.—Two cupfuls granulated sugar; half cupful of water; boil for six minutes; add one one grated cocoonut; as soon as the sugar is soft, spread on white, greased papers, and when cold, cut in squares. Flavor with vanilla.

LIZZIE'S NEW YEAR'S CAKE.—Four eggs; one cup butter; two cups sugar; two teaspoons caraway seeds; four teaspoons Horsford's baking powder; half cup milk; five cups flour; vanilla. Mix butter and sugar

to a cream; add the well-beaten eggs; add the milk, then three cups of the flour with the baking powder and the vanilla; mix *thoroughly*; add the other two cups of flour; roll out not quite half an inch thick, and bake in a quick oven.

SOFT GINGERBREAD.—One cup sugar; half cup butter; rub together. Add one cup molasses; two eggs; one teaspoonful of soda dissolved in one cup of milk; three cups of flour; one tablespoonful of ginger.

CABBAGE DRESSING.—Three tablespoonfuls of vinegar; one teaspoonful of salt; one teaspoonful of mustard; a piece of butter the size of an egg. Mix all together, and let them just come to a boil. Let them cool off a little, and then thicken with a beaten egg; boil up again; then thicken out with milk or cream, if desired.

BOSTON CREAM PUFFS.—Half pint of water; quarter pound of butter; a little over a quarter of a pound of flour; five eggs. Boil the water and butter together, and stir in the flour while boiling; then cool the mixture; add eggs one at a time, stirring thoroughly, but not beat them; this should be sufficiently thick to not run as it is dropped in the tin to bake; bake them about fifteen minutes until they are a delicate brown; make a small opening on one side, and fill with the following custard: Put one pint of milk over to boil; beat two eggs and one cup of sugar together; add half a cup of flour, and stir all into the boiling milk.

ITALIAN CREAM.—One quart fresh milk, one pint of rich cream, one ounce of isinglass. Boil the milk and isinglass, and make very sweet. Strain and flavor delicately with lemon or vanilla. When cool, add the cream, whipped very light. Stir in quickly, and put away to mold.

"THANK YOU."

THE SIGNIFICANCE OF SINCERE AND SPONTANEOUS COURTESY.

There is nothing we can give that costs so little and counts so much as politeness. Not that surface-dressing that, like whitewash when rubbed off, leaves an object entirely wanting in comeliness, but that genuine courtesy which roots in the heart and is fed by the truest purposes. Some people seem to think they can be independent of courteous manners because they are rich, or occupy honored positions. Some girls and boys are careless in manners, and thoughtless of the feelings of others, because their fathers are rich and bear titles; and I have known little people to be discourteous just because they happened to have a little higher standing in classes at school than some of their fellows. It is a good thing to be rich, to occupy higher positions, and to be at the head of one's class; but there is nothing that will so embellish a person who is thus fortunate as that genuine kindness of heart which thinks of the feelings and wishes of others at all times. One who has the germ of true politeness in his heart can never be boorish, and our aim should be to make the foundation of courtesy solid; then there will be no cracks in its superstructure. With a kind heart the face speaks the words of politeness, and the hands act the courtesy. We want no counterfeits, but the real thing. No "Thanks," that come out like words from a rubber stamp, but the "I thank you" that is each time written with an individuality of its own. The appreciation of a kindness shown in the hearty "I thank you," warms the heart and carries a delightful thrill with it that awakens a harmony that kindles pure emotions, and strengthens one's faith in humanity.

Subscriptions \$1 per year. Now is the time to subscribe.

THE WORLD'S CREMATED.—The total number of bodies cremated in the various countries to the 1st of August, 1888, is as follows: Italy, 998; Gotha, 554; America, 287; Sweden, 39; England, 16; France, 7; Denmark, 1.

CULTIVATING ART.—Mr. Grubs: "Thunderation! Hungry as a bear, and no signs of dinner. What's the matter?"

Little Bennie: "It's the girl's day out and ma hasn't got back from cooking school."

CITRIC ACID IN MILK.—G. T. Haekel has confirmed the existence of citric acid, as calcic citrate, in normal milk. The examination of many samples shows the presence of about 0.1 per cent. citric acid. A good cow yields daily, therefore, as much citric acid as is contained in two or three lemons.

LEPROSY.—Dr. Zambaco, of Constantinople, who has lived for several years among the lepers of the far East, says that he has never met a single instance of contagion, although the malady is certainly hereditary, the children of lepers becoming leprosy at the age of ten, fifteen and twenty years generally.

TO KEEP OFF MOSQUITOES.—Take a small quantity of a 2 per cent. carbolic acid solution, and sprinkle sheets, coverlets, pillow and bolster, on both sides, the edges of bed curtains, and the wall next the bed. The face and neck may also be slightly wetted with the solution. Not a single gnat or mosquito will come near.

PALLADIUM ALLOY.—C. A. Paillard, of Geneva, Switzerland, after fourteen years experiment, has determined that the alloy of palladium is non-magnetizable as used in watches, and is a satisfactory substitute for the metals commonly used. Only the hair-spring and compensation balance are made of this metal, and the cost of the watch is not increased.

COST OF MONARCHS.—Various governments pay their chiefs as follows: The United States \$50,000 a year; Persia \$30,000,000; Russia \$10,000,000; Siam \$10,000,000; Spain \$3,900,000; Italy \$3,000,000; Great Britain \$3,000,000; Morocco \$2,500,000; Japan \$2,300,000; Egypt \$1,575,000; Germany \$1,000,000; Saxony \$700,000; Portugal, Sweden and Brazil each \$600,000; France \$200,000; Hayti \$240,000; Switzerland \$3,000.

THE MORPHINE HABIT.—Erlenmeyer says that children born of women addicted to the morphine habit are practically morphine-eaters from birth. During the first few days of life, unless morphine is given to them, they are very apt to suffer collapse; and this condition may end in death, the child being too weak to withstand the violent symptoms, which are similar to those which follow the sudden withdrawal of the drug in adult opium-eaters.

TWO SIDES TO IT.

THE ROYAL SIDE AND THE TRUTHFUL SIDE.

The usual garbled, interpolated and untruthful quotations from official reports, cooked up lies and stories made out of the whole cloth, falsely credited to respectable journals, and emanating from the fertile brains of the advertising department of the Royal Baking Powder Company, have again made their appearance under the guise of extracts from exchanges, but in reality, as paid for reading notices. A few points need a little light to be thrown on them. The Royal would like to make it appear that the health authorities have advised the public against the use of phosphate baking powder, when exactly the reverse is true. No one who has any regard for the truth or for his reputation, has ever uttered one word of warning against a well-made phosphate baking powder, on the contrary, such as powder as Horsford's, has always been highly commended, and wherever it has become known and used, such inferior powder as the Royal has

never been able to get a foothold. The decision in St. Lawrence County, of which so much capital is made by the Royal, was a decision against some fraudulent maker of a baking powder, selling it under another firm's trade mark, and has been generally supposed to have been a cooked up decision on a case allowed to go by default. The New Jersey State Board of Health has reported adversely to cheap alum baking powders, but never against phosphate powders, as falsely alleged by the Royal. Not a single health board has ever officially endorsed the Royal, as that concern would like to have the public believe. Its claim to use a higher grade of cream of tartar than other manufacturers the AMERICAN ANALYST has repeatedly proven to be absolutely false. By a pooling arrangement, the manufacturers of cream of tartar in this country have agreed to make only one grade of cream of tartar, and while such large concerns as the Price Baking Powder Company and Cleveland Brothers, are using this best grade, they not being the owners of any cream of tartar factory, have no facilities such as the Royal, through its ownership of the New York Tartar Company possesses of using an inferior or half purified cream of tartar. What other manufacturers think on this subject can be readily seen from an extract from one of Dr. Price's advertisements. The Royal has never been able to answer this. "The introduction of alum and ammonia into baking powder, as a cheap adulterant, is one of the greatest evils of the day. Those corrosive substances have a caustic action, and when used in food disorganize the system and ruin the digestive organs. If alum and ammonia were required by the human system, nature would have placed them in the list with other necessities. The caustic chemical ammonia used as a 'cheapener' by adulterators of the public's daily food has its origin in an animal excrement, and yet it is introduced for leavening purposes in baking powders foisted upon the public as 'absolutely pure.' Manufacturers of baking powders have no right to place upon the market anything which has not by careful analysis and constant use been found not only harmless, but positively beneficial."

IODIDE OF POTASSIUM.

Probably there is no drug more frequently used, and with as much benefit, as iodide of potassium, or, as it is popularly and erroneously called, "iodide of potash." The proper Latin name for this salt, as employed in the United States, London and Edinburgh pharmacopœias, is *Potassii Iodidum*, while in the Dublin pharmacopœia it is called *Potassæ Hydriodas*. It is made by boiling together iodine, iron filings and carbonate of potassa in distilled water; then, after filtering, drying the crystals on bibulous paper. The chemical formula is 5 K I. Iodide of potassium crystallizes in small cubical crystals, very soluble in water, less so in alcohol. When exposed to air and sunlight, pure iodide of potassium becomes slightly brown, owing to the liberation of iodine. As we have seen, then, iodide of potassium is composed of iodine, a non-metallic element obtained from the ashes of seaweed and potassium. Let us for a moment see what is the effect of iodine on the system. In overdoses, it produces headache, giddiness, a metallic taste in the mouth, vomiting and purging, abdominal pain and convulsions. Medicinally, it is seldom used alone internally, but when so used it is most frequently in the form of iodized starch, consisting of iodine 5 parts to 95 parts of starch, of which from a teaspoonful to two tablespoonfuls is the dose. It is generally used as an alterative in scrofula, chronic enlargement of the joints, and in goitre. Compound solution of iodine is the German specific for typhoid. In the form of a vapor, iodine is an excellent inhalation in coryza (cold in the head), catarrh, hay asthma and chronic bronchitis. Externally, it is a counter-irritant and resolvent. Potassium, the other active agent in iodide of potassium, in its general effect on the system, hastens the process of oxidation, and lowers the temperature and the pulse.

As is frequently the case when the powers of iodine and potassium are combined, as they are in iodide of potassium, their respective properties are entirely changed, and they become, in this combined form, valuable depuratives for the elimination of morbid products from the system in rheumatism, gout and hepatic torpor, and powerful diuretics and antacids when there is acidity of the urine, and equally serviceable solvents for uric acid calculi. Medical authorities unite in ascribing to iodide of potassium great power as an alterative, promoting the absorption of morbid products, reducing glandular enlargements and inflammatory swellings, and causing the elimination of metallic poisons. Therefore, the administration of iodide of potassium is specially indicated in the following diseases: Sub-acute rheumatism and chronic gout, the intervals between attacks of summer catarrh and hay fever. In tertiary syphilis it is a specific in its various manifestations; in chronic pleurisy and pericarditis, and for the elimination from the system of such metals as lead, silver and mercury. The dose of iodide of potassium is from five grains to one dram. The effects on the system of this salt are very marked, especially on the secretions, into which it readily passes, and which it generally increases. When given in large and continuous doses, it has been found to irritate the mucuous membranes of the air passages; but there is not a single instance where any lasting ill effect has been produced by the use of iodide of potassium. The experiences of physicians all over the world as to the quantities used have been varied, yet the very fact that it is quickly decomposed in the system and passes in the urine probably accounts for the impunity with which it has been given even in maximum doses.

Much of what has been said about iodide of potassium has necessarily been technical and not so readily understood by the layman, but sufficient of this is clear enough to satisfy any fair mind that iodide of potassium in moderate doses is perfectly harmless in the most delicate system and an invaluable agent for good. Those manufacturers of so-called sarsaparillas who have cried out against it have probably been actuated more by a desire to save the expense of adding it to their preparation than by any real philanthropy.

To put a practical peroration to this explanation of the history and properties of iodide of potassium, it may be truthfully said that pure iodide of potassium in the minimum quantities added to such an excellent preparation as DR. AYER'S SARSAPARILLA never does harm, but always exercises a beneficial influence.

THE INFANT FOOD PROBLEM SOLVED.

LACTO-PREPARATA.

A GREAT ADVANCE IN THE SCIENTIFIC PREPARATION OF
A FOOD THAT SHALL BE A PERFECT SUBSTITUTE
FOR MOTHER'S MILK.

During the past twenty-seven years Messrs. Reed & Carnrick have frequently invited the medical profession of this country to visit their laboratory and witness the production of their various preparations, and, in a circular issued about a year ago they offered to pay the expenses of any physician from New York to Goshen and return. Since that time they have had the pleasure of exhibiting to a very large number of practitioners and several chemists of the highest standing, every step in the manufacture of their Food Products. They believe, and with good reason, that theirs is the only house in this country that has thus invited the profession to visit their laboratories, for this or any other purpose. A physician should never be asked to prescribe or recommend a food, or any pharmaceutical product, the composition or process of manufacture of which is kept secret. Messrs. Reed & Carnrick are confident that they are giving the Infant Food Problem more careful study, and are expending more money in the perfection of machinery for this purpose than any other concern, and

they are calling to their aid the best physiological chemists and practitioners in this country and Europe. They believe that their "Soluble Food" is the best food that can ever be artificially produced for a child from eight months to two years of age, and they are also firm in their belief that it is the best food now in the market made for children. They have, however, recognized the fact that nature intended that infants, from birth to the eighth month, should have milk alone; therefore they have studied this problem incessantly for for the past year, and have experimented most carefully with a view to producing a food for infants that should closely resemble human milk in composition and digestibility, and should be made wholly from cow's milk. They have been largely aided in perfecting this new product by Professor Attfield of London and by several eminent physiological chemists in this country. This, their latest preparation, will be presented in the form of a powder, and will, in composition, be almost identical with human milk. It is made wholly from cow's milk, with the exception that a portion of the milk fat is replaced by cocoa butter. This substitution was made by the advice of Professor Attfield after he had practically tested it with a number of infants. Cocoa butter resembles fat milk more closely in composition than any other fat and will keep perfectly. In this new Infant Food product the casein of the milk and also the fat are partially digested, and the remaining portion of undigested casein is left light and flocculent like the casein of human milk. They are confident, and the best physiological chemists agree with them, that this preparation is the nearest approach to human milk that can ever be produced and remain permanent. This new product is not intended to supplant Soluble Food, but is more especially designed for use during the first six months. This product will be placed on the market in May and will be called "Lacto-Preparata." Samples will be sent to any physician upon request.

A PROPHET AT HOME.—M. Pasteur has been the recipient of fifteen orders, only one of which is French.

SAWDUST FUEL.—The electric light station at Bath, Me., is burning sawdust in the furnaces there with satisfactory results.

CARPET BUGS.—Flour of sulphur has proved to be an efficient preventive against the ravages of the carpet bugs or buffalo moths.

TO BRIGHTEN BRASS.—Sweet oil and putty powder, followed by soap and water, are efficient means for brightening brass and copper.

A NEW VINTAGE.—Old soaker (at the club dreamily) "I say, waiter, that's the best wine I've had for ages. Bring another bottle." Waiter—"You've had no wine, sir. What you drank was the Worcestershire sauce?" —*To-Day*.

SULPHUR FUMIGATION.—Fumigation by the burning of sulphur is the most common method employed by boards of health in the disinfection of apartments in which contagious disease has existed, and the clothing worn by the patients during their illness. In an address delivered by the distinguished chemist, Dr. E. R. Squibb, before the Kings County Medical Association, he called attention to the fact that there must always be an abundance of watery vapor in the room to be disinfected; otherwise the sulphurous-acid gas generated by the burning of the sulphur is not an efficient disinfectant. The same is true of chlorine gas when used for disinfecting purposes.

LACTOPEPTINE.

The most important remedial agent ever presented to the Profession for Dyspepsia, Vomiting in Pregnancy, Cholera Infantum, Constipation, and all Diseases arising from imperfect nutrition.

Lactopeptine precisely represents in composition the natural digestive juices of the Stomach, Pancreas and Salivary Glands, and will, therefore, readily dissolve all foods necessary to the recuperation of the human organism.

CAUTION

We regret that we are compelled to caution the profession in prescribing Lactopeptine, but very careful investigation has proven to us clearly the necessity of it. Substitution of cheap and worthless compounds are being made in many cases where Lactopeptine is prescribed.

Lactopeptine is always UNIFORM, and its effects are SPECIFIC, and no one has ever been able to imitate its digestive value. If you do not obtain positive results when you prescribe Lactopeptine, you can be sure that some substitution has been made, and in such cases it may be necessary for the physician to prescribe Lactopeptine in the original ounce package to insure certainty of obtaining the genuine article. We can confidently make this assertion, knowing the scrupulous uniformity in digestive value of every ounce of Lactopeptine.

Lactopeptine has always been kept strictly in the hands of the Medical Profession, never having been admitted in any publications but Medical Journals. It is prescribed by the most intelligent and educated physicians in all parts of the world, and there are but few physicians who have ever used Lactopeptine that will not agree with the late Prof. L. P. Vandell, when he says: "Lactopeptine is one of the certainties in medicine, and in this respect ranks with Quinine."

In the various forms of Dyspepsia, in vomiting in Pregnancy, and in Mal-nutrition of children, there is no known remedy so positive in results.

A BUSINESS BENEFIT.

ADVANTAGES TO ADVERTISERS OFFERED
BY THE AMERICAN ANALYST.

It has not the limitations of a daily paper. No one reads yesterday's paper. A monthly lives at least a month, while a semi-monthly is fresh twice a month, and its audience is not limited by geographical lines, but the circulation is all over the United States and Canada.

It contains matters of interest to everyone, especially the ladies of the household, and is, therefore, sure of a careful perusal. Our audiences are intelligent and of the better classes, who have money to spend, and any well worded advertisement in our columns, giving real information, will receive a careful perusal.

Our rates are as low as our circulation affords. Large circulation and original matter cost money, and those advertisers who desire to realize these benefits must expect to pay reasonably for them.

Advertisements in our columns are permanent. Most of our subscribers bind their numbers.

Our advertisements are set up in an attractive form, sure to call the attention of the reader.

Anything that our readers want, or for which a demand is to be created, not wholly of a local nature, will pay to advertise with us.

We take only advertisements from legitimate houses of really meritorious goods, and give them all the editorial assistance they deserve; consequently our readers knowing this, have confidence in advertisements contained in our columns.

The fact that we have the best and largest houses in every branch of trade advertising with us, and that they always renew as their seasons arrive, proves beyond a doubt that they have found the **AMERICAN ANALYST** a good advertising medium. Why should not you?

OUR MISSION.

WHAT THE AMERICAN ANALYST IS DOING.

FIGHTING ADULTERATION.

The steadily growing favor which the AMERICAN ANALYST is constantly receiving at the hands of both the reading and the business public is the best evidence that could be afforded of the useful field of effort it occupies. It was the pioneer journal in this country to take up the fight against adulteration, and stands to-day, by public acknowledgment, the only competent exponent of the principles involved in that momentous struggle. To this end the realm of sophistication and fraud has been thoroughly explored, and its corruptions, as far as practicable, exposed to the public view. Charlatans, adulterators, and handlers of poisonous food have been summarily and uncompromisingly dealt with. Humbugs seeking to enrich themselves, through the sale of high-sounding specifics for human ailments, have been subjected to the crucial test of thorough chemical analysis of their goods, and where the latter, as too frequently occurred, proved to be utter frauds in name, composition, and pretended effects upon the system, the real facts have been placed before our readers in order to save the public from further unconscious imposition. The veil of chemical mystery in which tricksters of this kind ostentatiously envelop their processes of manufacture, protects them as yet from the criminal laws to which other confidence operators are held amenable, and the only method for counteracting their nefarious schemes is through public exposure by the newspaper press. In exposing this species of fraud, the AMERICAN ANALYST has conferred a benefit upon the community, to which the latter is giving grateful and substantial recognition.

SANITARY AND FOOD REFORMS.

In addition to the foregoing, the AMERICAN ANALYST is in constant co-operation with the Boards of Health of this and other cities, in efforts to secure sanitary and food reforms through organized methods, and while it is nobody's mouthpiece, it is conceded to be the only pop-

ular medium through which those bodies can bring their purposes and action intelligently before the general public. Reaching as it does all classes—manufacturers, merchants, physicians, chemists and private families all over the land—its influence is exerted over a vast radius, producing results as visibly marked as they are widespread.

DOMESTIC DIETETICS

Is a department of special interest to ladies. It is very different and far superior to the ordinary cookbook, in that it tells the housewife suggestively what to buy, what foods are in season, as well as how to prepare the many varieties of dishes, all in a practical way, easily followed. Other matters of great interest to housewives are also discussed.

PRACTICAL DISCUSSIONS.

Numerous other interests are also faithfully represented in our columns, such as articles relating to common experiences of society, the question of hygiene, and an infinite variety of practical subjects. In short, the AMERICAN ANALYST also keeps abreast in giving the fullest information on all matters directly or indirectly in the line of its proper field.

SCIENTIFIC INVESTIGATIONS.

The business transacted in the office of the AMERICAN ANALYST does not by any means all come to the surface in the pages of the paper. Minute analysis of chemical compounds, careful assays of minerals, examinations of questionable oils or doubtful condiments, and the many subtle operations incident to laboratory work are constantly required of us by correspondents far and near, and the results in many cases are not publicly recorded. In this manner, the influence of the paper encompasses a vast radius, from every point of which we receive constant expressions of approval, verbally, and in more substantial shape.

ITS VALUE TO ADVERTISERS.

No person can scrutinize the advertising pages of this journal without being impressed with the uniform high character of the numerous houses who find our columns the most desirable—because the most effective—medium for advancing their interests throughout the country in the several directions to which they respectively pertain. The steady growth of our subscription lists, extending to every State in the Union, and in fact all over the world, affords another gratifying evidence of the approval given to our endeavors to sustain genuine manufactures, and to expose spurious, fraudulent, and harmful knavery.

SUBSCRIPTION \$1 PER YEAR.

Considering the amount of practical information regularly embodied in its contents, together with the fact that the subscription price for an entire year is only one dollar, we believe the day is approaching when the AMERICAN ANALYST will be regularly welcomed in every intelligent household in the land. Address,

ANALYST PUBLISHING Co.,
19 Park Place, N. Y.

TO REMOVE FRUIT STAINS.—Pour boiling water on chloride of lime, in the proportion of 1 gallon to $\frac{1}{4}$ pound; bottle it, cork it well, and in using be careful not to stir it. Lay the stain in this for a moment, then apply white vinegar, and boil the table-linen.

SIMPLE BEE-VEIL.—The fear of being stung deters many from keeping bees who would otherwise gladly engage in it, and really, to some, the sting of the bee is no small matter. This, however, can be avoided by preparing a veil for the face. A cheap and easy way to make a bee-veil, and one as good as any, is as follows: Procure a piece of plain black cotton bobinet, sew it up as a sack, and run a draw-string in the end, which can be tied around the crown of the hat, and put a string in the lower end also, to tie around the neck, or simply tuck it around the neck, which will answer quite as well. Should a bee strike the veil with the intention of stinging, the rim of the hat will hold it at a sufficient distance from the face to render it impossible for it to reach the wearer.

A NEW USE FOR LIQUID PEPTONOIDS.

Successfully used in Dissolving the False Membrane in Diphtheria.

A Physician writes: "In an experience of over thirty years I have never used anything to equal your LIQUID PEPTONOIDS as a local application with a spray. It will dissolve the membrane and destroy the diphtheretic odor in less than twenty-four hours. I use the LIQUID PEPTONOIDS full strength, as a spray, two or three times a day, in bad cases."

Used successfully by another physician in two desperate cases:—"I was induced to try LIQUID PEPTONOIDS in two very desperate cases of DIPHTHERIA. I think I never saw throats more heavily coated with exudate than were these, and I think I never saw it more rapidly disappear than in these cases, by frequent spraying with your LIQUID PEPTONOIDS."

LIQUID PEPTONOIDS can be taken by patients unable to ingest food in any other form. In dyspepsia and loss of appetite its effects are positive, its digestive properties assisting in the digestion of food taken and its peptogenic properties quickly stimulating the natural digestive secretions of the stomach.

PANCROBILIN.

Prepared (in both Liquid and Pill form) from Extract of Pancreas and Bile.

This preparation is designed expressly to increase the digestion and absorption of fats.

We believe that the fat-digesting properties of pancreatine and bile are inseparable, and that without their union in the intestinal tract but little, if any, fat would be digested and absorbed.

PANCROBILIN will be found of great service in Phthisis and other wasting diseases, Nervous Prostration, Constipation, Inanition, Malnutrition, Intestinal Indigestion and wherever there is a failure to assimilate fats.

If the skin is first wet with LIQUID PANCROBILIN, the inunction of oils will be greatly facilitated.

LIQUID PANCROBILIN is put up in pound bottles. PILL PANCROBILIN is put up in bottles holding 100 pills. The coating of the pills will resist acid digestion, when given as directed, but will be quickly dissolved in the alkaline secretions of the duodenum.

PHOSPHO-CAFFEIN COMP.

(Granular Effervescent.)

Formula for each dessertspoonful:—

Caffein.
Acidi Phosphorici $\bar{a}\bar{a}$, grains, ss.
Antipyrin.
Ext. Apii. Grav. dulc. (Celery), $\bar{a}\bar{a}$ grains, j.
Sodium Bromide, grains, v.

The satisfactory results produced by PHOSPHO-CAFFEIN COMP. in Headaches, Neuralgia, Insomnia, Neurasthenia and general Nervous Irritability, are not due to the effect of any one ingredient, but to the happy effect of the combination. A thorough series of comparative tests have demonstrated the superiority of the above formula over any other in the market.

A VALUABLE BOOK FOR NOTHING.

The AMERICAN ANALYST will send to any person who will forward a New Subscription with One Dollar, a copy of

THE FAMILY CYCLOPÆDIA OF USEFUL KNOWLEDGE.

This is unquestionably one of the most interesting, entertaining and instructive books ever published. It is a universal educator for every member of the family circle, filled with useful information from beginning to end, and this information is given in such an attractive and pleasing way that the book is quite as entertaining as it is instructive. It treats of hundreds of subjects of which no man, woman or child who seeks to be well informed can afford to be ignorant, yet of which the masses of people are entirely unlearned. It contains the cream or substance of a dozen ordinary volumes, and is one of the most valuable and useful books a family can have in the house. No living man is so well informed that he may not learn from it. It is a book for the masses, for old and young, rich and poor, and will be read with pleasure and profit by all. It will likewise be found of great value as a work of reference. The book is profusely and elegantly illustrated, and is conveniently divided into departments, as follows: **Biography, History, Natural History, Travels, Manners and Customs, Etc.; The World Illustrated, Useful Arts and Manufactures, Trees, Plants, Fruits, Etc.; Great Inventions, Mining, Wonders of the Sea, Familiar Science, Law for the Masses, Statistical and Miscellaneous.** All the above subjects are fully and ably treated in this valuable book. It is a vast storehouse of useful and entertaining knowledge—unquestionably one of the best and most valuable books ever published in any land or language. No cyclopædia ever heretofore published at twice the cost is to be compared with this book in point of artistic make-up, beauty, and excellence of illustration, and quality of contents. As a holiday or birthday present for any one, nothing more appropriate or acceptable could possibly be selected. THE FAMILY CYCLOPÆDIA OF USEFUL KNOWLEDGE is a large and handsome book of 544 pages, 12mo, printed upon fine paper and elegantly bound in cloth, embellished with artistic designs in black and gold. It contains **Two Hundred and Seventy-three Beautiful Illustrations**, the original cost of which was over \$5,000. The book will be sent by mail, post-paid, to any person sending a **New Subscription with One Dollar**. It is as large and handsomely gotten up as books usually sold at \$1.50 and \$2.00, and in the quality of its contents is worth a dozen ordinary volumes.

OR LIQUID PEPPER.

Is simply the Pulp of the Ripe Pepper Extracted by Pressure.

The seed of this Pepper was obtained from Central America, and by careful cultivation in Louisiana for many years has been so improved in strength, flavor and aroma, as to have become a new variety of Red Pepper, superior to all others. The pulp is so handled as to retain all the flavor, strength, aroma and color of the ripe fruit, and to keep unimpaired in any climate. It excites the appetite, promotes digestion, and is pronounced, by connoisseurs, to be the finest condiment in the world. For medicinal purposes it recommends itself by its purity, strength and diffusible form.

Manufactured by E. McILHENNY,
NEW IBERIA, LA.

For Sale by all Wholesale Grocers.

NATRONA BI-CARBONATE OF SODA.

ABSOLUTELY PURE.)

The nature of the raw material from which NATRONA BI-CARBONATE OF SODA is made—viz., kryolith, a mineral containing *pure sodium*—insures a purity and uniformity of product which cannot be obtained from any other known material. In making Bi-CARB. Soda from any other raw material, the use of sulphuric acid is a necessity, but none is used in any part of the process of making NATRONA BI-CARB.; hence its entire freedom from the slightest trace of arsenic, which is always present in ordinary soda. Its absolute purity and entire freedom from all traces of *sulphate of soda*, common salt and other impurities, render NATRONA BI-CARB. NEARLY TASTELESS, and being bolted through the finest bolting-cloth, insures the finest stage of division.

To these indisputable facts the attention of CONSUMERS of soda is specially called. They are IMPORTANT, and should influence both those who use and those who sell soda, to buy and sell NONE BUT THE BEST.

The NATRONA BI-CARB. Soda is kept in stock by almost every wholesale druggist and grocer throughout the United States, of whom it may be ordered.

Natrona Bi-Carb. Soda is unequalled by any other brand of English or American Manufacture.

ALL are kindly requested to peruse this number thoroughly.

The AMERICAN ANALYST can be had at any news stand in the United States. Any news-dealer will take orders for it, the American News Company being our wholesale agents. All postmasters will receive subscriptions.

Its superior excellence proven in millions of homes for more than a quarter of a century. It is used by the United States Government. Endorsed by the heads of the Great Universities as the Strongest, Purest, and most Healthful. Dr. Price's Cream Baking Powder does not contain Ammonia, Lime or Alum. Sold only in cans. PRICE BAKING POWDER CO. NEW YORK. CHICAGO. ST. LOUIS.

COLDEN'S LIQUID BEEF TONIC.

AN INVALUABLE AID IN THE TREATMENT OF ALL CASES OF DEBILITY.

Established 15 Years. Endorsed by Scores of Physicians. Essentially Different from all other Beef Tonics. Beware of Imitations.

COLDEN'S LIQUID BEEF TONIC consists of the Extract of Beef (by Baron Liebig's process), spirit rendered non-injurious to the most delicate stomach by extraction of Fused Oil, soluble Citrate of Iron, Cinchona, Gentian and simple aromatics. An official analysis of this preparation by the eminent chemist ARTHUR HILL HASSALL, M. D. F. R. S., and an endorsement by SIR ERASMUS WILSON, F. R. S., is printed on the label of each bottle.

Its Range of Action Embraces all Cases of Debility.

By the urgent request of several eminent members of the medical profession, I have added to each wineglassful of this preparation two grains of SOLUBLE CITRATE OF IRON, which is designated on the label as "No. 1," while the same preparation, without Iron, is designated on the label as "No. 2." It acts directly on the sentient gastric nerves, stimulating the follicles to secretion and gives to weakened individuals that first pre-requisite to an improvement, an appetite.

I will, upon application, send a sample bottle of Colden's Liquid Beef Tonic to any physician in regular standing. Please ask your Dispensing Druggist (if he has not already supplied) to order it. In prescribing this preparation physicians should be particular to mention "COLDEN'S" viz: "EXT. CARNIS. FL. COMP. (COLDEN)." It is put up in pint bottles and can be had of Wholesale and Retail Druggists generally throughout the United States.

WHO USES OLEOMARGARINE?

One of the points which the opponents of oleomargarine endeavor to sustain is that the commodity in question is sold principally as a fraudulent substitute for butter. As a matter of fact, it is largely purchased wherever the legal hindrances are not too great by persons of moderate means, who prefer its cheap excellence to the expensive slush they would otherwise be constrained to use under the name of the legitimate article. A correspondent of the *Commercial Bulletin*, writing from Washington, April 22d, sets forth this fact with the irrefutable emphasis of statistical proof. The gist of the communication is summarized by the editor as follows: "Statistics of oleomargarine manufacture recently published in our columns gave rise to the question whether the large and increasing production is disposed of mainly to dealers, who may or may

not sell under truthful representations, or to families and consumers, who must be fully informed as to what they are buying. The statement is made in the trade that dealers rarely buy smaller quantities than fifty-pound tubs, while ten and twenty-pound packages are generally for family use. Through the courtesy of Internal Revenue officials, our Washington correspondent has obtained official information that, of the pound tax collected during the past year on the production of oleomargarine in the Eastern States, more than fifty per cent. has been for stamps covering ten-pound packages, nearly seventy per cent. for packages of less than thirty pounds, and about eighty per cent. for smaller quantities than fifty pounds. These figures indicate that a very large proportion of the production has been sold in the smaller packages specially fitted for family use, and presumably disposed of to consumers who buy it knowingly under stamp and brand. So far as official records throw light on the question, their evidence is against the supposition that the consumption of oleomargarine can be attributed to sales under misrepresentations."

ALUM BAKING POWDERS.

There has been much discussion as to the effect upon the system of the use of alum in baking powders. When these arguments emanate from manufacturers little dependence can be placed upon them, and even when they come from chemists they are not always based upon absolute facts. Now, Professor J. W. Mallett, of the University of Virginia has made some experiments, the results of which are published in the *Chemical News*. We reprint the following summary without comment. Care should be taken by the reader not to confound these condemned alum baking powders, which contain as an ingredient the acid phosphate of calcium, with a genuine phosphate baking powder like Horsford's:

In the examination, twenty-seven samples, representing seventeen brands, were analyzed. Nearly all contained as their acid ingredient a mixture of alum and acid phosphate of calcium ("super-phosphate"). All contained as the alkaline ingredient acid carbonate of sodium ("bicarbonate of soda"). After a most thorough and painstaking inquiry into the whole subject, he reached the following conclusions: 1. The greater part of the alum baking powders in the American market are made with alum, the acid phosphate of calcium, bicarbonate of sodium and starch. 2. These powders, as found in retail trade, give off very different proportions of carbonic acid gas, and therefore require to be used in different proportion with the same quantity of flour, some of the inferior powders in largely increased amount to produce the requisite porosity in bread. 3. In these powders there is generally present an excess of the alkaline ingredient, but this excess varies in amount, and there is sometimes found, on the contrary, an excess of acid material. 4. On moistening with water, these powders, even when containing an excess of alkaline material, yield small quantities of aluminum and calcium in a soluble condition. 5. As a consequence of the common employment of calcium acid phosphate along with alum in the manufacture of baking powders, these, after use in bread making, leave, at any rate, most of their aluminum in the form of phosphate (when alum

alone is used the phosphate is replaced by hydroxide). 6. The temperature to which the interior of bread is exposed in baking does not exceed 212 deg. Fahr. 7. At the temperature of 212 deg. Fahr. neither the "water of combination" of aluminum hydroxide, nor the whole of the associated water of either this or the phosphate, is removed in baking bread containing these substances as residues from baking powder. 8. In doses not very greatly exceeding such quantities as may be derived from bread as commonly used, aluminum hydroxide and phosphate produce, or produced in experiments upon himself, an inhibitory effect upon gastric digestion. 9. This effect is probably a consequence of the fact that a part of the aluminum unites with the acid of the gastric juice, and is taken up into solution, while at the same time the remainder of the aluminum hydroxide or phosphate throws down in insoluble form the organic substance constituting the peptic ferment. 10. Partial precipitation in insoluble form, of some of the organic matter of food, may probably also be brought about by the presence of the aluminum compounds in question. 11. From the general nature of the results obtained, the conclusion may fairly be deduced that not only alum itself, but the residues which its use in baking powder leaves in bread, cannot be viewed as harmless, but must be ranked as objectionable, and should be avoided when the object aimed at is the production of wholesome bread.

AMERICAN LARD.

In view of the general discussion that is going on in the papers relative to the introduction into the market of lard containing cotton-seed oil in its composition, we commend our readers to the article on that subject, quoted in another column, from the *Commercial Bulletin* of this city, of April 22d. The case could not be put plainer or be made more clear. The only possible cause of complaint against the large manufacturers of this compound lard is that they ought to sell their product for what it is, has lost its point, from the fact that for many months past not one of these refiners has put out a single package of compound lard without having the same plainly branded in letters at least two inches long "Compound Lard." The only fraudulent lard we know of now in the market is what is often called Export Lard, and is made of the scraps, trimmings, sweepings, spoiled hams, floor-scrappings and dirt, not to mention other and more disgusting makeweights made by the small butchers, and generally known as city steam lard, which is not a compound of anything as clean and wholesome as cotton-seed oil or suet. As this stuff is sold at \$6.85 as against Western steam lard at \$7.62 per cwt. and compound lard at \$6.87, it may be readily seen why the makers of this vile lard cry out so vehemently against clean and honestly labelled compound lard.

ENGLISH BREWERY SYNDICATES.

The more that is learned about the purchase of American breweries by so-called English syndicates the more interesting the subject becomes. In a recent purchase in a city not far from New York the brewers were in-

ROCK CANDY and ROCK CANDY SYRUPS.

For use at the Soda Fountain and in all Pharmaceutical Preparations requiring chemically pure syrup. Warranted to keep in any climate. Order of Wholesale Druggists, Grocers, Confectioners, or of

DRYDEN & PALMER,
19 Hudson St., New York.

duced to sell because they were offered considerably more than their businesses were worth to them. The plan there seems to be to pay an exorbitant price and then to water the stock as much as it will stand, the original owners agreeing to buy in one-third of the stock on the new capitalization and to remain and run the breweries as before. The rest of the stock is then to be peddled here and in England on the assumption that there is a great public appetite for brewery stock and that the masses will imagine there are certain to be big profits, either regardless of the watering process or in ignorance of the same.

A MEAN CONSTITUENCY.

The *Produce Exchange Bulletin* with its issue of April 27th, passed out of existence. We sincerely regret this circumstance and especially because it seems to be solely due to the want of proper support from those who have been assisted by the publication. With two or three honorable exceptions, the persons engaged in the manufacture of oleomargarine, have not acted in a way best calculated to protect and advance their own interests. They have been penurious and selfish, have allowed one or two liberal firms to pay the expenses, while they have selfishly appropriated the benefits to themselves and have refused in every instance to bear any of the burdens. There can be no doubt that if these men had taken a more public-spirited and liberal position, many of the proscriptive laws which have been passed to the injury of the legitimate manufacture and sale of oleomargarine, never would have been on the statute books, and several of those laws passed under missapprehension, would long ere this have been repealed. All such laws are the results of legislators being left in ignorance of the facts and subjected to the influence of men having only selfish motives. Legislators must be kept informed of the real wants of their constituents if the latter desire intelligent legislation and this can only be done by the plentiful use of type and printers' ink, throwing light upon the scheming designs of the people, who are invoking the aid of legislation to help them accumulate money at the expense of legitimate competitors and uninformed consumers. We know whereof we speak, when we say that for all the prohibitory oleomargarine legislation these sordid men have none but themselves to blame, and that unless they quickly change their course, they will soon be entirely wrecked on the rocks which they have not had the public spirit to remove from their path. Meanwhile we are sorry for the fate of our late contemporary and hope soon again to see its enterprising editor in the ranks of the fraternity, and represent-

ing some more liberal constituency, than that which has just left him to his fate.—*Vale Produce Exchange Bulletin*.

A CHANCE FOR OUR CONSULS.

Mr. James H. Sanders, of Chicago, who some years ago went to Europe on behalf of the United States Government to investigate the action of the English, French and German Governments with respect to the exclusion of American hog products and American cattle from those countries is in Washington for the purpose of inducing the present Administration to use its influence towards having this discriminating legislation revoked. He is supported in this effort by breeders generally and representatives of the agricultural interests of the country, who have appealed to the State Department for assistance. Their idea is that by the appointment of suitable Consuls and the promulgation of proper Consular instructions on the part of the State Department, much can be accomplished in these foreign countries in the direction of removing prejudices against our products. At any rate, it is thought that the Consuls can be useful in investigating grounds of hostility against these classes of importation, and that the result of such investigations may point the way to international negotiations. Mr. Sanders finds Secretary Blaine disposed to give the matter attention, and hopes that the present Administration will be able to accomplish much in the way of removing these restrictions.

WATERED MILK.

THE NEW YORK SUPPLY LARGELY MADE UP OF SKIMMED AND WATERED MILK.

The local officials charged with the inspection of milk say that large quantities of impure milk arrive in this city every day by the various railroads from points throughout the State. They further state that when the periodical inspections are made at railway depots in the early morning, more or less adulterated milk is always found. From this it would appear that much of the adulteration of which New Yorkers complain is accomplished in the country, despite the supposed vigilance of the State Dairy Department. Mr. B. S. Van Valkenburgh, the Assistant State Dairy Commissioner, denies that any considerable number of producers adulterate their milk, and says that most of the adulteration is done by the wholesale and retail dealers of this city. In support of his position Mr. Valkenburgh quotes the following as the result of the inspection of 28,242 cans of milk last year:

Cans.	Cans Adulterated.
1,720 Creamery milk.....	1
12,890 Farmer's milk.....	76
8,861 Peddlers' milk.....	74
3,405 Store milk.....	139
Total number of cans containing adulterated milk.....	290

The test in these inspections was made with the lactometer, which Commissioner Van Valkenburgh admits is not accurate. The adulteration in each instance was by watering, and the 290 offending cans represent nothing but the quantity of milk that was discovered to be adulterated by the addition of water. Although the Commissioner assumes that the other 27,952 contained pure milk, there is no certainty that such was the case, as by the lactometer test skimming and watering and coloring would not be revealed. Mr. Beebe, who is chief of the Sanitary Bureau of the Board of Health, in reply to certain remarks recently made by Commissioner Van Valkenburgh on this subject, denied that most of the adulteration was the work of city handlers. "We have long recognized the fact that

adulterated milk is brought to this city every day," said he. "With the force of inspectors at our command it would be impossible to prevent this evil. The raids that we make now and then at the railroad depots are not with the purpose of locating and prosecuting the parties who are found in possession of bad milk, but simply to get information as to the quantity of impure milk coming in. When Mr. Van Valkenburgh says that most of the adulteration is done in this city, I think he is mistaken. He is right regarding the quantity adulterated with water, but I think that the larger part of the skimming is done before the milk reaches this city. I will not say that it is through any neglect of duty on the part of the State inspectors that skimmed milk is shipped here. They cannot cover every platform in the district and watch every collector, but lots of bad milk arrives here, and it is useless to deny it. As to adulteration with water, I think there is more of that in the city than in the country, but it is inconsiderable now compared with a year ago. What the Health Board needs is more inspectors. The present force is unequal to the task they are called upon to perform. At proof of this is the fact that with all our inspections, arrests of offenders, punishments and fines, it is very difficult to procure good milk in this city. The lactometer is not perfect but it enables us to get through a volume of work which would be impossible without it."

DRINKING WATER.—Professor Angell, of Michigan University, furnishes the following as a test of the purity of water for drinking: "Dissolve about half a teaspoonful of the purest white sugar in a pint bottle completely full of the water to be tested, and tightly stopp'd; expose it to daylight and a temperature up to 70 deg. Fahr. After a day or two examine, holding the bottle against something black, for whitish floating specks, which will betray the presence of organic matter in considerable proportion."

THE WATCH ANATOMIZED.—The average watch is composed of 175 different pieces, comprising upward of 2,400 separate and distinct operations in its manufacture. The balance has 18,000 beats or vibrations per hour, 12,060,080 in thirty days, 157,630,000 in one year. It travels 1 43-100 inch with each vibration, which is equal to 9½ miles in twenty-four hours, 292½ miles in thirty days, or 3,558¾ miles in one year.

OIL PAINTINGS.—A freshly executed painting may have its colors presented in the mellow tones of the old masters by first covering the back with a coating of Fuller's earth, which absorbs all remaining oil, and then, on removing it, covering the back with a coat of linseed oil, which the colors presently imbibe. This is the alleged discovery of a celebrated French painter.

INVISIBLE LACQUER.—"Ardenbrite" is a new invisible lacquer recently introduced into London. It is so strong as to withstand weather, steam, smoke, sea air or sea water; and gold, silver, copper, steel, brass or iron does not tarnish when coated with it. As it is so fine as to be unseen on the most delicate instruments, the new lacquer has an extensive field of application.

WAX FINISH.—One of the most satisfactory wax finishes for wood is made by boiling a quarter of a pound of white wax with one ounce of pearl ash and one quart of water. It is to be stirred while boiling, the stirring being afterward continued until cold. The composition is to be applied with a paint brush, after which the surface is rubbed until dry with velvet plush.

LETTERING IVORY.—A process of lettering bone or ivory, by sinking the letters into the material in a permanent fashion, has recently been introduced. These ivory plates are taking the place of engraved metal plates for signs, checks, badges and so on. Electrical engineers have also adopted the new plates, which can likewise be applied to organs and piano-fortes.

NEW DOOR OPENING.—A door that opens automatically on putting a coin in the slit has recently been brought out. The door is made double, each half being L shaped and hinged at the angle. They are closed and held fast by a lock which unlocks when the coin actuates it and the door opens. It closes again after the person enters.

CORRESPONDENCE.

THE COTTON SEED LARD QUESTION.

NEW YORK, April 24, 1889.

Editors AMERICAN ANALYST: My attention has been called to an article in your issue of the 21st ultimo, headed "Lard vs. Cotton Seed." The article is preceded by an inquiry from a correspondent signing herself "Miranda," in which she asks for information relative to the wholesomeness and also the cheapness of this product. There are several unintentional inaccuracies in your reply thereto, which I should be obliged if you will allow me space to correct. We are not disposed to argue the question regarding our use of the word "lard," in this connection. That is a subject which admits of argument. However, we do take exception to your statement relative to the amount required to produce the results which are obtained by the use of ordinary lard. You say it takes about three pounds to answer the same purpose as two and a half pounds of good hog lard and that it is sold at a higher price. Replying to your first proposition, we beg to state that it has been proved by repeated experiments (and we are ready to repeat the proof to your satisfaction at any time) that it requires something less than four-fifths of this product to do the same work and do it better than hog lard. In this sense alone it is cheaper, and in the matter of the selling price it is also cheaper, since it is retailed at about twelve or thirteen cents per pound, whereas pure hog lard commands a considerably higher price than this. Furthermore, replying to your statement to the effect that "for many foods it cannot be employed, because of the peculiar smell of cotton seed oil, etc.," we would say that, although this product emits a peculiar nutty odor, such odor does not enter in the least into the food prepared with it, and I venture the opinion that if cooks and housekeepers had been using cotton seed lard all their lives, and the attempt to substitute hog lard therefor were but now undertaken, much louder complaint would be made about the smell and taste of hog lard than of cotton seed lard. I must apologize for intruding at this length upon your valuable space, but I felt that this article called for a reply, and I have no doubt that your sense of fair play will induce you to publish it. Very truly yours,

J. W. TAPPIN,
Manager of the Cotton Oil Product Co.

HUMAN FOOD.

AN INQUIRY INTO ITS VITAL CONSTITUENTS.

According to the Lomb prize essay on "Healthy Homes and Foods," the vital elements or constituents of the latter are not numerous, and may all be embraced in the following counts, namely:

- (1) Albumens or proteids.
- (2) Fats of oils.
- (3) Starches or carbohydrates.
- (4) Inorganic or mineral salts.
- (5) Water.

To the albumen or proteid group belong some of the most important food stuffs. They all contain nitrogen, and for this reason the term "nitrogenous constituents" is used sometimes instead of proteids or albumens. The chief proteids are ordinary albumens, as the white of egg, casein of milk, fibrine of meat, gluten of grains and flour, and legumine of peas and beans. The amount of proteid in the different foods is variable; thus, meat contains from 15 to 23 per cent.; milk from 3 to 4; peas and beans from 23 to 27; grains and flours from 8 to 11; bread from 6 to 9; and potatoes and greens from 1

to 4. When we remember that the blood, muscles, and all the vital organs contain proteids as their chief constituents, we can understand the importance of taking food rich in one or more members of this proteid group. The average workman requires in his daily food the equivalent of four or five ounces of pure proteid. The fats or oils, animal and vegetable, when oxidized or consumed, produce more force than will arise from the combustion of an equal weight of any other food stuff. In cold countries the inhabitants instinctively consume large amounts of fat on account of the heat which is generated from it. The workman requires not less than two ounces of fat per day. Fats are best digested when taken in a finely divided state. To the group of starches or carbohydrates belong a number of well-known substances of similar chemical composition, a majority of which pertain to vegetable foods—the most important are starch, sugar, gum and dextrine. Like the fats, they are consumed in giving energy to the body, though a much larger amount of the carbohydrates is required to yield the same result. The daily need of this food stuff by the average workman is between seventeen and eighteen ounces. The cellulose or cell structure of plants is closely allied to the members of this group, and any cellulose that is absorbed or assimilated must first be converted into sugar. Concerning the group of inorganic or mineral salts, it may be observed that the bones of the adult man contain as much as 70 per cent. of mineral matter, the greater part of which is the phosphate of lime. Smaller quantities of the phosphate of magnesium and the carbonate of lime also exist in blood. The muscles, blood and tissues also contain salts of potash and soda, and some iron. One of the most important mineral foods is common salt or chloride of sodium; but the quantity needed for daily consumption, and of the alkalies, such as soda, etc., is inconsiderable, and need not be stated. Water, though commonly regarded as possessing no nutritive qualities, is in reality the most important of all the food elements that sustain and perpetuate life. About 70 per cent. of the adult body is water. It forms the greater part of the vital fluid, in which it serves as the carrier of other substances, some in solution, others held in suspension. Besides the fluids, the solid tissues contain a greater or less proportion of water; the muscles contain as much as 75 per cent. There is also great loss, or rather use, of water by evaporation from the skin, by exhalation from the lungs, and by excretion from the kidneys and bowels. This loss must be made good by the drinking of water, and by taking foods more or less rich in this constituent. Meat contains about 85 per cent.; milk, on an average, 87; bread, 35; and vegetables and fruits, from 70 to 90 of water. The quantity of this fluid needed per day, by a laboring man, it is impossible to estimate, as it varies greatly with circumstances, the temperature of the weather, humidity of the atmosphere, kind of labor, etc., and is taken in many and varying forms in food supplies of every description. To say nothing of the inorganic or mineral salts and water, the cost of which are merely nominal, the average workman requires daily in his food, in round numbers, not less than four ounces of proteins, two ounces of fat, and eighteen ounces of carbohydrates. What combination of foods will furnish these for the least money? This is an important question, but it should always be borne in mind that the foods suggested are healthy ones. A combination which would cost but little, but which would lead to dyspepsia or other ills, might in the end be quite expensive. It has been definitely determined, both by experience and science, that certain varieties of foods are richest in these vital elements, and are therefore most valuable, and such as contain the most of them, at a given price, and, as a matter of course, the cheapest, and will go the farthest toward sustaining life, health and strength. As a practical illustration of the foregoing, we append two of the daily rations from the prize essay, of the many given, with the per cents. of their proteids, fats and carbohydrates, and approximate cost of ration, aside from cooking,

which would be but a slight item if any considerable number were to be cooked for:

FOODS.	PRO- TEIDS. OZ.	FATS. OZ.	CAR- BOHY- DRATES OZ.	COST.—CENTS.
26 oz. bread.....	.82	0.13	14.35	5 at 5c. per loaf.
2 oz. sausage.....	0.57	0.80		1½ at 12c. per lb.
2 oz. oatmeal.....	0.29	0.12	1.90	½ at 4c. "
4 oz. beans.....	0.92	0.08	2.14	1 at 4c. "
1 cz. bacon.....	0.14	0.37		¾ at 12c. "

It will be seen that each of these daily rations contain the requisite amount of the vital elements, and this is true of all the other rations contained in the work.

OUR GRANDMOTHERS' COOKING.

GLEANINGS FROM THE RECIPE BOOKS OF 100 YEARS
AGO.

Old cookery books seem to bring us much nearer to our dead and gone progenitresses, and show us that, though they did not read much, and could do mighty little in the way of spelling, they were simpler, and perhaps sweeter, women than their granddaughters. They could scarcely fail to be so, for the mere exercise of the one art which they practised as an art brought them hour by hour in the most intimate relation with nature and her bounties. In the season when green things flourished hardly a day can have passed without these good ladies themselves going into their gardens to seek the fagot of sweet herbs which was to impart flavor and fragrance to their "ragoos" and savories, or the marigolds which poor Charles Lamb hated so much when they floated on his mess of Charter House pottage, but which Simple Susan's enemy Barbara found so tempting. The greater part of our grandmothers' lives must have been spent in culling simples, expressing juices, gathering fruits, and spying out things to pickle. This was not done haphazard. Was there anything that the women of a hundred years ago did not pickle or preserve? They pickled parsley green to cheat grim winter of some of its terrors; they pickled "nasturtions"—and a very excellent pickle they make. They pickled the large shoots of elder to imitate "the Indian bamboo." "They put out in the middle of May, and the middle shoots are the most tender." They pickled green walnuts "when they will bear a pin to go into them"—which is also done to this day. They were aware that "the clusters of elder-flowers makes (sic) a delicate pickle before it opens," and that to effect this it was only necessary to pour vinegar over them. They also knew that the seeds of elder should be pickled while still green, as a substitute for capers, and that "large cucumbers of the kind called green turley, prepared as mangoes, are excellent, and come sooner into eating." They pickled radish pods, young artichokes, horse-radish, samphire, marigold flowers, and more things than can well be enumerated. Having pickled nearly every green shoot, stalk, pod and seed, they began to do the same by plums, apricots, peaches, currants and grapes. When they set about making jams no fruit escaped them—they even attacked vegetables. When they made cakes it was the same. Parsnips, raspberries, etc., were made into cakes, and red beet-

root, potatoes and oranges into biscuits. Wine-making, too, was then a recognized branch of female industry, and every fruit in turn was chosen as a basis, and some flowers and vegetables—notably cowslips and parsnips—were promoted to the same dignity. There is a very pretty recipe for cowslip mead, made of honey, lemons, seven pecks of cowslip pips, and a handful of sweetbriar. The sweetbriar is a delicious ingredient, but think of picking seven pecks of pips! A recipe is given for making elder-flower wine “from the tree which bears white berries.” We are confidently told that “it drinks very like Frontinac.” Wine of black elderberries is said to be equal to the best Hermitage claret; and another recipe instructs us how to make wine of white elderberries. Or sycamore, birch, walnut, blackberry or balm wines—all these were once made by fair and dainty housewives, and now are made no more. And then there was shrub, wherein to one gallon of new milk, flavored with lemons and Seville oranges, was added two quarts of red wine, two gallons of rum, and one of brandy. Sweet dishes, also, were generally made by the ladies of the family, and there is much play of fancy in the naming of them. In turning over the pages we find directions how to spin gold and silver webs for desert, to spin birds’ nests, to make a Chinese temple or obelisk, a fish-pond with silver and gold fishes, a hen’s nest, with strips of lemon for straw, and eggs filled with flummery, a hen and chickens in jelly, a desert island. “Take a lump of paste and form it into a rock three inches broad at the top, set it in the middle of a deep china dish, and set a cast figure on it with a crown on its head and a knot of sugar candy at its feet,” etc. “If this dish is for a wedding supper, put two figures instead of one,” so the desert island is not so much of a desert after all. Next comes a “rocky island,” and then a “floating island,” with sheep, swans, “or you may put in snakes, or any wild animals of the same sort.” Moonshine is another dish with a pretty name, and there is likewise a recipe for “moon and stars in jelly,” a half moon with seven stars shining out of flummery colored with cochineal and chocolate to imitate the color of the sky. We still have numbers of people among us whose eye for color is as fine as that of the inventor of this; but who now makes moon and stars in jelly? “Solomon’s Temple in flummery” is a yet finer flight of the imagination. A recipe for making an amulet takes our fancy, but loses its attraction when we find it is only Mrs. Raffald’s way of spelling omelet. Who can say how much the construction of some of these quaintly-named and delicately-compounded dishes may have been to our grandmothers? Perhaps it was their poetry, their sphere of art, their one escape from the monotony of their quiet lives.

DAIRY SCIENCE.

THE CHEMISTRY OF MILK, BUTTER AND CHEESE.

Milk, the most important of all dairy products, is in many respects a perfect food, inasmuch as it contains representatives of all the substances which go to make up the animal frame. It is principally composed of water, butter, milk-sugar, casein, and soluble and insoluble inorganic salts. The amount of the principal constituent, water, is very variable, even from legitimate causes, but may be said to average from eighty-five to ninety per cent. Although to the unaided eye milk appears to be a homogeneous white fluid, the microscope shows it to consist of a clear liquid, in which are suspended numerous globules, which make it opaque. These globules consist of milk-fat, or butter, and each one is surrounded by a very thin covering, or membrane. When they are violently agitated, as in churning, these membranes are broken, and the globules of butter cohere together into larger masses. The formation of the butter is, to some extent, dependent on the temperature; and in old times, when the butter resolutely re-

fused to “come,” the trouble was laid to the witches, and a red-hot horseshoe was dropped into the churn, which served the double purpose of frightening away the witches and heating the cream. Cream is the lighter portion of the milk, which rises to the surface upon standing. It contains a large proportion of the fatty matter, and is collected and saved for churning. The buttermilk remaining after churning contains about one-fourth of the fatty matter. Pure butter is principally a mixture of two fats, known as margarin and olein, with smaller quantities of butyryn, caproin and caprin. These fats are all analogous to each other, margarin having the symbol $C_{54}H_{104}O_6$. It is a compound of margaric acid and glycerine, and the margaric acid in turn is probably a mixture of stearic and palmitic acids. These fats are practically identical with those formed in the body of the animal, from which the well-known butter substitute, oleomargarine, is made. The principal chemical difference between the two articles is the lack of the butyryn, caproin, etc., in the artificial product; but, as far as healthfulness is concerned, one is as good as the other. In fact, a good article of oleomargarine is preferable to the poorer grades of butter. Fresh milk, when chemically tested, is found to be slightly alkaline, and this alkali serves to hold in solution a very important substance called casein, which is the basis of cheese. If a little vinegar or other weak acid is added to milk, this substance separates out in the form of curd. The insoluble pellicle which forms on the surface of boiling milk is due to this substance. When milk sours naturally, lactic acid is formed, which neutralizes the alkali, and the casein separates. It also has the peculiar property of being precipitated by the action of rennet, or the mucous membrane of the stomach of the calf. In this case no acid is formed; but the action seems to depend upon the presence of bacteria, or microscopic organisms, in the rennet. If the milk is warmed, it separates more readily; hence when milk that has very slightly soured is added to hot tea or coffee, it “feathers” from the separation of the casein. Chemically, casein resembles albumen, containing less sulphur than that substance. A substance known as legumin, or vegetable casein, is found in peas and beans, which closely resembles that of milk, and is coagulated by rennet in the same way. If, after churning, the casein contained in the buttermilk is not thoroughly removed from the butter, it will induce a fermentation or decomposition, resulting in the production of certain volatile and offensive acids, and the butter becomes rancid. In the manufacture of cheese the casein is coagulated by rennet, pressed into the desired shape and allowed to stand and “ripen.” The ripening process is a fermentation analogous to that produced in rancid butter, and the powerful odor of certain cheeses is due to the same volatile acids. It is only a matter of habit which makes the flavor of cheese agreeable to some persons, while that of rancid butter is repulsive to everyone. Some semi-civilized nations, more consistent than ourselves, will only eat butter when sufficiently “high,” considering the fresh article tasteless and insipid. The different kinds of cheeses are dependent upon the kind of milk used in their preparation, the richer ones being made from milk containing a larger proportion of cream. Stilton cheese is made from a mixture of new milk and cream, Cheddar from new milk alone, Cheshire from milk from which about one-eighth of the cream has been removed, and Dutch cheese from skimmed milk only. The other constituents of milk are of minor importance. Milk-sugar is used, to a limited extent, in medicine; and the inorganic salts, which consist principally of phosphates and chlorides of potash, soda, lime, magnesium and iron, are only valuable as increasing its value as a food. From the earliest times milk and its products have been recognized as the best possible substances for the nourishment of the human body; and the results of modern chemical analysis confirm this belief, and show that they are most perfectly designed to produce health, strength and flesh.

ADULTERATION OF LARD.

COMPOUND LARD SUSTAINED IF SOLD UNDER PROPER REPRESENTATIONS.

The reported action of the French Government adverse to adulterated lard is in accordance with a sentiment to which we cannot afford to remain indifferent. The leading nations of the Old World and the new have declared unmistakably their opposition to the importation into their markets under the name of lard of a compound freely denounced in its own country as an adulteration and a deception. England, France, Germany, Canada and Mexico are in virtual accord on this question, and a verdict to which they all subscribe cannot be attributed to unfriendliness nor a desire to discriminate against a product so important to their people. They have accepted the declaration, persistently made and sustained by committees of our own legislatures and Congress, that our lard trade is largely based on fraud, and they are, one by one, taking steps to protect themselves against deception. It is true that American lard is an important item in the food supply of the world, and that by discriminating against it foreign nations injure their own people; but it is also true that it is an important item of our commerce, and that we cannot afford to invite action by other nations excluding it from their markets. The so-called pure lard movement in this country has resulted in an attack on the integrity of our product that affords ample excuse for restrictive legislation wherever public sentiment insists on fair dealing and honest trade representation, and has supplied the pretext for hostile action wherever the spirit of “protection” or resentment prompts a desire to exclude our lard from a foreign market. In view of the testimony submitted to Congressional committees, we cannot complain of any action yet taken, nor be surprised at more radical measures, if we do not ourselves adopt some means of removing the pretext for prohibitions and restrictions. The case has been made out that of our so-called lard production a very large percentage is not lard in the sense of an unadulterated hog product, but is a compound equally wholesome and nutritious, as well or better adapted to many uses, specially fitted for some branches of the foreign trade, and cheaper than the unadulterated article. The facts in the case have been given as widespread notoriety as has ever been accorded to the merits of any commercial controversy. The so-called refined or compound lard has received its scientific testimonials endorsed by Congressional committees, and its merits and comparative advantages have been as widely and freely advertised as the pure lard movement has exercised its influences. The nations of the world have listened to an unseemly fight between two factions of our lard trade, and have declared their judgment that in the interest of fair dealing our products should be sold for what they are, and that so long as we denounce a large portion of our lard trade as a deception buyers had better protect themselves. In view of the present state of affairs, it seems almost incredible that there should be a difference of opinion as to the advisability of requiring lard and its compounds to be sold under truthful representations as to their character. Deception and misrepresentation can never confer substantial or lasting advantage; but in this case the secret is out, and whatever motive may have existed for concealing the fact of lard adulteration it has been destroyed by the complete exposure. There can be no reason, even on the lowest ground, for refusing to act openly on a state of affairs so generally understood. There should be an acknowledgment of the presence in our own markets and export trade of two distinct articles—a pure and a compound lard—clearly distinguished, plainly designated, and competing for favor on their merits. If the compound lard is recognized and accepted at home, its cheapness appreciated, and its sale conducted openly, it will find as much favor abroad as its merit deserves, and will be as fairly treated. If it is sold under false pretences at home and the inference justified that it fears to forfeit favor by avowing its character, not only will the present contest continue and the crimination of rivals afford pretext for additional restrictions and decrees of exclusion, but the scandal will reflect discredit on other branches of American trade, and exercise influences as injurious and far-reaching in their evil consequences as the attempted deception is demoralizing and dishonest.—*Commercial Bulletin*.

TEMPERATURE OF THE OCEAN.—The bulk of the water of the ocean has a low temperature. It is ice cold at the bottom, even under the equator, but on the surface within the tropics there is relatively a thin film of warm water with a temperature of from 70 deg. to 84 deg. Fahr.

CONDENSED MILK.

WHAT INGREDIENTS ENTER INTO THE VARIOUS BRANDS.

Dr. Walter H. Kent, Chemist of the Brooklyn Department of Health, published, in the *Brooklyn Medical Journal* for March, a very interesting article on the subject of condensed milk. To apprehend the importance of this article, it is necessary to call the attention of the reader to the fact that the public generally supposes that condensed milk is ordinary cow's milk with all that it contained originally, only deprived of a portion of its water, and that, if the quantity of water taken away is replaced, the cow's milk, just as rich and just as suitable for every purpose, is again ready for use. Now, we shall proceed to quote Dr. Kent's article, leaving technical matters and giving his conclusions:

Dr. Koenig makes the statement, that for every 100 parts of albuminous substance in cow's milk there are from 100 to 110 parts of fat, and that this relation must obtain in condensed milk. Or, in other words, the amount of fat must equal or exceed the amount of albuminous substances. It will be remembered that the albuminous substances of cow's milk, or albuminoids, as they are frequently termed, are substances containing uniformly about 15.8 per cent. of nitrogen, and that they are of a sufficiently stable character to withstand the process of the evaporation of the milk without loss. As by the evaporation of milk there is no loss of fat or albuminous substance, and as by the addition of pure sugar neither fat nor albuminous or other nitrogenous substance is added, the ratio of fat to the albuminoids must be the same in condensed as in normal cow's milk,

and on these facts is based the method which Koenig gives. Before accepting the statement, however, that the amount of fat in cow's milk does really equal or exceed the amount of albuminoids, and basing conclusions as to whether a given condensed milk is made from skimmed milk, it may be well to examine the statement as to whether it is really true. This can only be shown from the analysis of normal cow's milk with reference to the amount of fat and albuminoids such milk contains. Fortunately, such analyses have been made so many times by chemists of good repute that little more is necessary than to examine the published results. After giving these results, Dr. Kent proceeds thus: "The rule which Koenig gives is, therefore, good, and with the normal milk of a number of healthy cows taken together it is true that the amount of fat exceeds the amount of albuminoids. If market milk, or condensed milk, or milk condensed and preserved with pure sugar, is found to contain less fat than albuminoids, it may, therefore, be concluded that it is skimmed milk or made from milk deprived of cream to any extent at least proportional to the excess of albuminoids." From the rule which Koenig gives, and which for healthy milk abundant evidence shows to be true, it must be concluded that samples 3 to 19, inclusive, were made from milk the cream of which had been more or less removed. It will be remembered that milk sold in the market must contain at least 3 per cent. of fat; while with several brands of condensed milk, if diluted according to the directions given for making milk, they would contain much less than that amount. The 25 or 30 per cent. of water of the condensed milk is, of course, a remaining portion of the 87 or 88 per cent. which ordinary milk contains:

and I claim many as such—will pardon the presumption on my part of the discussion of a subject that comes more within their province than that of mine. But this conclusion has been forced from observations that reach over a period of many years as a surveyor in the West. I have observed that there were more cases of sickness of this kind during, or immediately after, the season in which there were the greatest number of electric showers or electric disturbances as shown by the surveyor's instruments. I conclude, then, that heat and electricity are the prime causes of "malaria," and that they weaken the stomach and, in a large majority of cases, produce the diseases usually attributed to this cause. I give the thought to the profession, with the hope that it will offend none.—EDWIN WALTERS, in *St. Louis Republic*.

VEGETABLE HYPNOTISM.

THE LAUGHING-PLANT OF ARABIA.

Palgrave, in his work on Central and Eastern Arabia, mentions a plant whose seeds produce effects analogous to those of laughing gas. The plant is a native of Arabia. A dwarf variety is found at Kasum, and another variety found at Oman, which attains a height of from three to four feet, with woody stems, wide spreading branches and light green foliage. The flowers are produced in clusters and are yellow in color. The seed pods contain two or more black seeds of the size of a French bean. Their flavor is a little like that of opium the taste is sweet, and the odor from them produces a sickening sensation and is slightly offensive. These seeds, when pulverized and taken in small doses, operate upon a person in a very peculiar manner. He begins to laugh loudly and boisterously, and then sings, dances and cuts up all kinds of fantastic capers. The effect continues about an hour, and the patient is extremely comical. When the excitement ceases, the exhausted individual falls into a deep sleep, which continues for an hour or more, and when he awakens he is utterly unconscious that any such demonstrations have been made by him.

STRONG FOOD.

HOW SOME CASE-HARDENED PALATES ARE TICKLED AND SOOTHED.

In the Sinclair House restaurant the other morning a guest was waiting for his breakfast at a table next to a *News* reporter's. He poured some Worcestershire sauce into a tumbler, added as much water, and drank it off. Then he dumped half the contents of a full decanter of catsup on his plate and sopped it up with his bread. When the breakfast came, the bread and catsup were all gone, so he ordered a fresh supply of the former, and soaked it in Worcestershire sauce to give it a flavor. "He does it every day," said the waiter; "but he eats a dollar-and-a-half breakfast, so I guess the house does not lose anything. There's a good many cheaper customers that's nearly as bad, though. Ketchup is what they mostly go for, and they go for it so heavy that we never have a bottle on the table, and only bring it when it is asked for. Some are very fond of oil. I've seen a man dump a whole cruet of oil into his plate and soak his bread in it, and eat it. Another one mixes vinegar with his water, and also soaks his bread in it. About the only things they let alone are the salt and red pepper. Mustard and horse-radish they eat by the spoonful, and when cakes are in season they'll take a whole half-pint pitcher of syrup to a ten-cent plate of wheats or flannels. We've got one customer who make as drink for himself out of syrup, water and vinegar, and drinks it before every meal. He says it's good for his

MALARIA.

A PHYSICAL DISTURBANCE ATTRIBUTABLE TO ELECTRICITY AND HEAT.

Another delusion is malaria, so called. The word malaria means bad air. The diseases that are attributed to this cause are frequently common in districts where there is no stagnant water or anything else to taint the atmosphere. It will be remembered that during the autumn of 1881 there was an unusual number of people who were attacked by these diseases in southwestern and west-central Missouri and also eastern Kansas, when there had been no rains of any consequence for

months, and that, too, in districts far removed from decomposing water or any other substance. The cause or causes of these diseases were surely not in the air, consequently should not be attributed to malaria. It is more probable that during the dry, hot weather of summer that the heat that is radiated and the electricity that is generated by the sun have an enervating influence on the system—that from the nerve centres this influence reaches the muscular system, principally through the pneumogastric nerve, and the stomach being the most delicate and intricate of almost any of the involuntary muscles, is the principal sufferer from such enervating influence. Indigestion follows as a symptom, and an increase of bile brings what is called biliousness and malaria. I hope my medical friends—

stomach. I'd like to know what his stomach's lined with." The physicians say that this craving for stimulating condiments and odd compounds is due to diseases of the stomach. Hard drinkers and dyspeptics are guilty of the most extraordinary excesses of this character. Cases are cited of men who make meals off bread and mustard, and the drinking of Worcestershire sauce is by no means uncommon. In Munich, where enormous quantities of beer are consumed, the heaviest drinkers, who absorb quarts a day, are constantly nibbling at raw turnips seasoned with salt and bread smeared with mustard. The wine toppers of France, Spain and Italy, consume vast quantities of oil, often drinking a glass of it between a certain number of stoups of wine, whose intoxicating effects it is supposed to offset. In many Italian drinking shops in this city a bowl of peanut or cotton seed oil is kept on the bar, with a dish heaped with cubes of sour bread made from damaged flour, by way of free lunch.—*News*.

DOMESTIC DIETETICS.

SPECIALLY PREPARED, FROM PRACTICAL TESTS, FOR THE
LADY READERS OF THE "AMERICAN ANALYST."

SEASONABLE FOOD.

May.

MEATS.—Beef, lamb, mutton, ham, kidneys, liver, sausage, veal.

GAME AND POULTRY.—Brant, pigeon, chicken, duck, turkey, goose, snipe,

FISH.—Anchovy, bass, catfish, cod, eels, clams, flounder, halibut, herring, lobster, mackerel, mussels, perch, porgie, rock-fish, salmon, shad, shrimp, turtle, trout, sturgeon, whiting, weak-fish.

VEGETABLES.—Artichokes, beans, carrots, garlic, lettuce, onions, parsley, parsnips, potatoes, shallots, spinach, turnips, water cress, radish, rhubarb, sea kale.

PRACTICAL RECIPES.

VEGETABLE SOUP.—One pint of vegetables, including turnip, carrot, onion and celery; cut into small pieces and boil one hour in water enough to cover. Add one quart of clear stock, a little more salt, boil a few minutes and serve.

POTATO CROQUETTES.—Boil four potatoes in salt and water, peel, and pass through a sieve; add a lump of fresh butter, salt and pepper to taste; roll into croquettes on a wooden slab, and sprinkle with flour; cover with egg and bread crumb, and fry in butter; when a good color, dish up, garnished with fried parsley.

CORN GEMS.—One-half pint finely-bolted corn meal, one-half pint flour, one tablespoonful white sugar, half a teaspoonful of salt and two heaping teaspoonfuls of Horsford's baking powder; mix together thoroughly while dry. Then add two well-beaten eggs and cold sweet milk, or milk and water to make a moderately thin batter; bake in Gem pans or muffin rings.

GEN. WASHINGTON'S BREAKFAST CAKE.—Two pounds flour, one quart milk, one ounce butter, one teacupful thin yeast, three eggs, one teaspoonful salt; warm the milk and butter together, and pour it lukewarm into the flour and add the other ingredients; mix this at night, and put in a pan three inches deep; in the morning bake in a quick oven three-quarters of an hour. This is said to have been a favorite dish of General Washington.

MIXED SALAD.—Cut into small pieces some anchovies, pickled tongue, stoned olives, beets, gherkins, bits of lobster and crushed Boston crackers; mix well; cut up the hearts of some heads of good fresh lettuce, put it in cold water, drain; put it in the salad bowl; add the

mixture; cover all with mayonnaise dressing and serve.

CARAMEL CREAM.—Have on the fire in a pan one pound of maple sugar; let it boil two or three times, sufficient to brown but not burn it. Beat six eggs and one pound of white sugar very light; stir this into two quarts of boiling milk, and stir constantly until it comes to a boil; then pour in the boiling sugar, and mix thoroughly. When perfectly cold, add one quart of cream, sweetened with a cupful of white sugar. Put it in a freezer and freeze the same as ice cream.

ALMOND JUMBLES.—One pound of sugar, one-half pound of butter, one pound of almonds blanched and chopped fine, two eggs, flour enough to mix stiff. Roll thin; moisten the top of each one with the white of egg, and sprinkle with sugar; bake quickly.

CREAM WALNUTS.—White of one egg; stir into it sufficient powdered sugar to make it stiff enough to handle, flavor with vanilla; dip the walnuts into a syrup made of two tablespoonfuls of sugar and one of water, boiled three or four minutes. Mould the cream with your fingers, and place between the two halves of a walnut. Dates or Malaga grapes may be used. To make chocolate cream walnuts, stir two tablespoonfuls of melted chocolate into the cream.

FILTERING DRINKING WATER.

THE INADEQUACY OF THE AVERAGE FILTER TO PURIFY THE LIQUID.

Drinking water may be and very often is the carrier of the germs of disease, and can also be rendered otherwise unwholesome by the admixture of foreign substances, both organic and inorganic. It is also a fact that drinking water supplied to cities is often below the proper standard of purity, and in some instances positively bad. The failure of city corporations to supply water of good, wholesome quality, or at least of the appearance of such, has made it necessary for individuals to resort to means of supplying the deficiency. The expedients adopted for this purpose are mainly boiling, and the various methods of filtration. Domestic filtration is commonly employed to strain out suspended matter, and thus clarify the water. A more important object is the removal of bacteria. The efficiency of the various kinds of filters in the market in removing suspended particles is easily tested, but the determination of the efficacy of different filtering materials in removing micro-organisms, requires skillful manipulation in the biological laboratory. Chemistry failed to furnish the desired proof, and no means was available until the culture process was introduced. The application of this test has led to important discoveries, which have exposed the imperfections of filters usually selected for household use, and stimulated the search for materials better adapted to meet the newly imposed and most essential requirements of the process of filtration. In an elaborate paper on the efficacy of filters, read and discussed before the Section of Public Health of the New York Academy of Medicine, Dr. Charles G. Currier, of this city, has contributed some valuable information to our knowledge of the bacteriology of drinking water. It shows that domestic filtration, as commonly practised, is little else than a process of straining, which clarifies the water and not only fails to remove bacteria but, with old filters, constructed of improper materials, or not properly cleansed and sterilized, will add to the water a larger percentage of bacteria than that contained in the water before filtration. Dr. Currier's conclusions, with which we do not agree in all respects, based upon very elaborate experiments, are, briefly: That boiling for thirty minutes will destroy harmful bacteria; that chemical agents are useless for sterilizing drinking water; that ordinary filters do not remove all bacteria from drinking water; that filters of porous rebaked

porcelain are the best, but to insure permanency of action they should be occasionally sterilized throughout by steaming, or other means. When filtration is necessary, it should be conducted carefully on a large scale through sand-beds upon which there is a fine layer of organic and inorganic matter expressly produced by sedimentation. When domestic filtration is employed, on account of danger of infection, the water should, as a rule, be furthermore boiled.

Water, even after having been exposed to various chances of contamination, is very generally drunk as it is received from lakes or rivers, wells or springs, tanks or hydrants; and, despite the most disinterested warnings, people are not ready enough to believe that clear, sparkling water may at times be the most harmful of beverages; that it can carry with it, and introduce into the systems of a portion at least of those who drink it, the immediate causes of various impairments of health. Polluted water may be agreeable to the taste and have no visible sediment, yet cause many deaths. Such water the unskilled are slow to suspect, and but for the advance in sanitary science and the warnings conveyed by those familiar with hygienic studies, pure supplies of drinking water in cities would be much more of a rarity than they are. At the Hygienic Congress in Vienna, in 1887, M. Brouardel stated that he knew of over sixty epidemics of typhoid fever which had been induced by the drinking of infected water. From typhoid fever thousands of deaths occur every year; and, although scientific physicians are constantly urging these facts, it seems to be necessary that the danger present itself in the form of an epidemic before the people fully realize the immense harm which may result from impure drinking water. The epidemic which ravaged Plymouth, in Pennsylvania, four years ago, attracted great attention at the time, but the history of several similar "visitations" since then would indicate that the full value of this severe lesson has not been properly appreciated. Water may be very highly colored, and yet, if freshly collected near its source, show no very large number of bacteria. Such is the case with the best of the peaty "juniper" water which I have examined in various parts of the Dismal Swamp of Carolina and Virginia. Although having a large proportion of organic matter, this water is reputed eminently wholesome, and an inquiry among a portion of those drinking this exclusively, appears to show an unusual degree of immunity from the manifestations of diseases which might be attributed to the effects of improper drinking water. On the other hand, the turbidity which is common at this season of the year in the streams furnishing the water supply of many of our cities, is almost always accompanied by a large number of bacteria, as in these bottles of water which you see here from the Mississippi and from some of the rivers flowing into the Atlantic. The melting snow and the rain, which wash into the streams an increased amount of organic matter, introduce with it other germs (perhaps pernicious), and bring more nutriment than usual to the micro-organisms already in the water, thus increasing their vitality and numbers. It is believed, like most of the varieties of bacteria found in water, the still larger forms of animal and vegetable life, ordinarily existing in lakes and rivers, are not prejudicial to health. It is through the products of the decomposition of many of these, when their life has ceased, that they may become harmful. Chemistry has long furnished a means of recognizing polluted water, even when it yielded no sediment visible to the unaided eye, and the presence of considerable quantities of chlorides, nitrites, and ammonias, determined by the chemical tests, has shown that many a water had more organic impurity than was permissible, and, when far below the accepted standard in this respect, such a water is very justly condemned. Yet it seems as though enough of the infective element of cholera or typhoid to diffuse an epidemic throughout a community can be added to a drinking water and not be detectable by chemical tests. A perusal of the very complete and instructive paper by Professor J. W. Mallet

(in the report of the National Board of Health for 1882) shows how widely such determinations may vary and how unreliable chemical standards may be. The known disease-producing bacteria, however, do not appear to increase in water in which there is not more organic matter than the proportion that chemists of constant and large experience regard as permissible in waters which they pronounce to be of fair quality, although these harmful bacteria, if once introduced there, may long retain their vitality and remain dangerous. Since, as yet, chemistry, when called upon to aid in solving the question of the purity of a water, can at its best only approximately estimate the amount of organic matter present and its state of oxidation, while it fails to inform us whether infective matter be present or not in a given water, it has been hoped that a sure means of recognizing whether a water be in any degree infected was reached when Koch introduced the bacteriological test. This test, while very definite and conclusive under favorable conditions, has thus far been able to decide absolutely in only a small portion of the cases of disease apparently coming from the use of drinking water. Yet in those cases where the bacteria characteristic of distinct disease have been detected in the suspected water, the isolation, culture, and identification of the disease-producing species furnish a convincing proof of the great value of the method.

To be continued.

LIFE'S RISKS.

HOW THE WORLD IS CLAIMED TO BE FULL OF DEATH-TRAPS.

The worst enemies of the human race are the doctors who try to prolong our miserable existence in a world

that is full of death-traps. One medico tells you not to eat or drink what you relish because you will eat or drink too much. Another says that you must only eat what you fancy, because otherwise you will bolt your food without giving to each morsel the thirty-six mastications which are necessary for digestion. You must wear a respirator over your mouth, a pad on your chest and a swathe of flannel round your loins. If you live in town you will die of fog; if you go to the country you will be poisoned by bad drainage; if you drink water you are tempting the typhoid fiend; milk spells scarlatina, and tea-cake is sudden death. Do you shun these tempestuous pleasures of the senses and take refuge in the recreations of the mind? Do you borrow a novel from the circulating library? That is to import the germs of disease into a healthy household. The volume in your hands may have been perused by a person recovering from an infectious illness!

IMITATION GOODS.

THE PUBLIC TO BLAME FOR DEMANDING IMPOSSIBLE CHEAPNESS.

This is an age of cheap and poor imitations. There is scarcely a valuable commercial commodity that is not imitated with more or less success, and the worthless imitation palmed off upon a public always ready to be humbugged. In clothing, in household furniture, in groceries, provisions and all manner of goods and chattels there is more or less sham and shoddy. It is in fact almost an impossibility to purchase honest goods at reasonable prices. Humbugging the public is getting to be one of the fine arts. Dishonesty is apparently a necessity with many people who cannot keep up their extravagant style of living without acquisition of money

for that purpose by cheating, defrauding and deceiving others. This is the age of veneer; every comfort and pleasure of domestic life is sacrificed for outside show. Many people will undergo many actual privations in order to keep up a stylish equipage or reside in a stone-front mansion on a fashionable street. These are the people who buy cheap and adulterated groceries, who pinch their stomachs, undermine their health and often go without necessary clothing in order to be considered high-toned and "swell." Our principal cities are filling up with a certain class of men who have grown rich rapidly. Very few of these have acquired wealth by straightforward business methods. Some have acquired fortunes by lucky speculations, some by the appreciation of real estate or personal property, but most by trickery, fraud and the exercise of superior greed and cunning. Could the American public know and fully realize what the vile stuff is that it is eating, drinking, wearing and spending its hard-earned money for there would be little short of a revolution. Beware of suspiciously cheap goods, particularly when they are offered by comparatively unknown or irresponsible parties. You can take it for granted that something is wrong when any staple commodity is offered to you for less than the regular market price. You must bear in mind that if the practice of selling sham and shoddy goods is ever suppressed, it must be done by concerted action of the country merchants. The trade will be supplied with spurious articles of every conceivable kind so long as there is a general demand for them.—*Criterion.*

PASTEUR'S SUCCESS.—At a recent lecture in London on the Pasteurian methods Professor Horsley stated that the use of these methods of treatment had reduced the mortality in cases of hydrophobia from 15 per cent. to 1.3 per cent.

BUFFALO LITHIA WATER

In the Uric Acid Diathesis, Bright's Disease, Chronic Inflammation of the Bladder, etc.

JAMES L. CABELL, M. D., A. M., LL. D., Professor of Physiology and Surgery in the Medical Department in the University of Virginia, and President of the National Board of Health.

"The Water of Buffalo Spring No. 2 contains in notable quantities two of the ALKALIES which are accredited as extremely valuable in the treatment of GOUT, LITHIASIS, and Liver Affections. I refer to the CARBONATES of POTASH and LITHIA.

"I have recently read with interest a paper in 'The New York Medical Journal' on the Buffalo Lithia Water in Diseases of the NERVOUS SYSTEM, in which the writer, Dr. Boyland, citing his own observations and those of other eminent physicians, ascribes to this water a special virtue as a direct tonic for the NERVOUS SYSTEM in cases of CEREBRAL exhaustion. I have only had occasion to test its effects in this direction in cases in which the NERVOUS SYMPTOMS may have been due to LITHÆMIC conditions. In these cases the relief following the use of the remedy was very decided."

Dr. WM. A. HAMMOND, of New York, Surgeon-General U. S. Army (retired), Professor of Diseases of the Mind and Nervous System in the University of New York, etc.

"I have for some time made use of the Buffalo Lithia Water in cases of affections of the NERVOUS SYSTEM, complicated with BRIGHT'S DISEASE OF THE KIDNEYS or with a GOUTY DIATHESIS. The results have been eminently satisfactory. Lithia has for many years been a favorite remedy with me in like cases, but the BUFFALO WATER CERTAINLY ACTS BETTER THAN ANY EXTEMPORANEOUS SOLUTION OF THE LITHIA SALTS, and is, moreover, better borne by the stomach. I also often prescribe it in those cases of CEREBRAL HYPERÆMIA resulting from over-mental work—in which the condition called NERVOUS DYSPEPSIA EXISTS—and generally with marked benefit."

Dr. ROBERT BATTEY, of Georgia, SUGGESTOR OF BATTEY'S OPERATION.

"I would state that I have been using the Buffalo Lithia Water, No. 2, in my practice for three years past, in cases of CHRONIC INFLAMMATION of the BLADDER, whether induced by STONE, by enlarged PROSTATE in the aged or by NEGLECTED GONORRHOEA, AND HAVE SECURED EXCELLENT RESULTS, which encourages me to prescribe it for the future."

HUNTER MCGUIRE, M. D., LL. D., late Professor of Surgery, Medical College of Virginia, Richmond.

"BUFFALO LITHIA WATER, Spring No. 2, as an ALKALINE DIURETIC, is invaluable. In URIC ACID GRAVEL, and, indeed, in diseases generally dependent upon a URIC

ACID DIATHESIS, it is a remedy of extraordinary potency. I have prescribed it in cases of RHEUMATIC GOUT, which had resisted the ordinary remedies, with wonderfully good results. I have used it also in my own case, being a great sufferer from this malady, and have derived more benefit from it than from any other remedy."

Dr. WM. B. TOWLES, Professor of Anatomy and Materia Medica in the Medical Department of the University of Virginia.

"BUFFALO LITHIA WATER, No. 2, belongs to the ALKALINE or, perhaps, to the ALKALINE-SALINE Class, for it has proved far more efficacious in many diseased conditions than any of the simple ALKALINE waters.

"I feel no hesitancy whatever in saying that in GOUT, RHEUMATIC GOUT, RHEUMATISM, STONE in the BLADDER, and in all Diseases of URIC ACID DIATHESIS, I know of no remedy at all comparable to it.

"Its effects are marked in causing a disappearance of ALBUMEN from the urine. In a single case of BRIGHT'S DISEASE OF THE KIDNEYS I witnessed decided beneficial results from its use, and from its action in this case I should have great confidence in it as a remedy in certain stages of the disease."

Dr. THOMAS H. BUCKLER, of Paris (formerly of Baltimore), SUGGESTOR OF LITHIA as a Solvent for Uric Acid.

"Nothing I could say would add to the WELL-KNOWN REPUTATION OF THE BUFFALO LITHIA WATER. I HAVE FREQUENTLY USED IT WITH GOOD RESULTS IN URIC ACID DIATHESIS, RHEUMATISM, AND GOUT, and with this object I have ordered it to Europe, from Coleman & Rogers, of Baltimore. Lithia is in no form so valuable as where it exists in the Carbonate (the form in which it is found in the BUFFALO LITHIA WATER), Nature's mode of solution and division in water which has passed through Lepidolite and Spondumine Mineral formation."

Dr. GRAEME M. HAMMOND, of New York, Professor of Diseases of the Mind and Nervous System in the New York Post-Graduate Medical School and Hospital.

"In all cases of BRIGHT'S DISEASE of the KIDNEYS I have found BUFFALO LITHIA WATER of the greatest service in increasing the quantity of urine and in eliminating the ALBUMEN. In certain cases of Melancholia, accompanied by excessive eliminations of URATES and URIC ACID, it is often the only remedy necessary. In GOUT and RHEUMATISM it is highly beneficial, and in many cases of Impotence its restorative qualities have been of undoubted assistance. I have long regarded BUFFALO LITHIA WATER as the most valuable mineral water in use."

Water in cases of one dozen half-gallon bottles, \$5.00 per case at the Springs.

THOMAS F. GOODE, Proprietor, Buffalo Lithia Springs, Virginia.

NOT AT ALL THE CLIMATE.

It is a subject of common remark among European medical practitioners that dyspepsia and kidney complaints are infinitely more common in the United States than in the Old World. The fact used to be attributed to the climate, just as Europeans a little less than fifty years ago attributed to the brilliancy of our atmosphere the great superiority of American daguerreotypes, until our American artists went over there and proved conclusively that the credit belonged wholly to their greater skill. Our climate is no more responsible for the prevalence of those maladies among us than the atmosphere was for the better pictures. If there is any credit due for them, it all belongs to us, ourselves. We live altogether too active and fast a life; wear out too rapidly our brain and nerve tissues; exact too much from the organs upon which we have to rely for keeping up our vital energies and getting rid of the products of our excessive wear and tear. We eat in haste, with a mania for concentrated and stimulating foods; plunge into active brain-work immediately after we have gorged ourselves, thereby hindering the processes of digestion, and allow ourselves insufficient time for healthful exercise, or for necessary recuperation in sleep. When our appetites fail, we first tempt our palates with rich food, savory sauces and toothsome tit-bits. When those pall upon us, we force our reluctant appetites by high seasoning, alcoholic stimulants and treacherous drugs. About that time we are prone to mention to our friends that we "do not feel just exactly right," and, in compliance with their suggestions, or what we erroneously think we ourselves know, we begin dosing for the relief of symptoms. "Heart-burn," or sour stomach, strikes us. While it is a novelty to us, we think it feels like a flame from the infernal regions, inside us. When we grow accustomed to it, we deliberately conclude that it is a little worse than that. Of course, we clutch at any temporary relief, and hasten the destruction of our stomachs with bicarbonate of soda or some other strong alkali. For relief of the sensation of a heavy leaden ball in the stomach, we shovel in bismuth, and get mighty little good from it. We cannot sleep well, but chloral hydrate and brom. pot. fix that—for a while. Our bowels are inactive; well, there are bushels of pills in the drug stores, strong enough to agitate the insides of brass monkeys, and when their reaction increases our constipation, we can take more and more of them.

Somebody sympathetically assures us that our breath "would stop a clock," so we chew spices and swallow charcoal. Pimples, sties and boils break out on us, and we try to cure them with Somebody's "skin soap." We have bad pains in our backs, and we slap on plasters. So we go, through a long chain of symptomatic affections, each of which we vainly try to cure with some specific palliative, never really touching the real cause of the whole trouble. No other vital organs are so sensitive and prompt to make it known when anything is the matter with them, as the stomach and kidneys. It is astonishing how long a person may loaf around among the living with only a piece of a lung, or a diseased heart; and we all know lots of people of whom it is said, all their lives long, that their heads are "not quite right." Even the liver, that big tyrant, puts up with a great deal. But when anything goes wrong with the kidneys, they not only make keen suffering themselves, but spread it rapidly to other centres, and induce a whole train of dangerous—and some of them incurable—maladies. And they are so apt to suffer through their generous willingness to shoulder the responsibilities of the liver when it, afflicted by a well-grounded sense of injury, grows sulky, torpid and lazy. There is no use doctoring them only. You might as well try by poulticing a bunion to cure a broken leg, as attempt to restore health to diseased kidneys when the bowels are constipated, the liver torpid and the blood impure. Simultaneous treatment of all the organs, stimulating and strengthening them, and purifying the blood is the imperative necessity of the hour, and for this service you can resort to nothing so certainly or speedily efficacious as Ayer's Sarsaparilla, the best of all alterative and tonic medicines.

TANNING BY ELECTRICITY.—A Swedish inventor has applied the alternating electric current to a commercial problem so successfully that its use bids fair to revolutionize the tanning industry both in this country and abroad. The process has been in successful operation in Sweden for eighteen months, and an experimental plant has been established here to demonstrate its value, as the owners of the patents in this country are determined to verify all claim for the process before its actual introduction. Patents are held in seventeen different countries. By the process it is claimed that sole leather can be tanned in 800 hours by the application of an alternating current for one-eighth of the time, the old methods requiring six months.

OIL FUEL.—An English firm has been using petroleum for fuel in a torpedo-boat and getting a speed of twenty-one knots. The oil is carried in the vessel's double bottom.

JAVELLE WATER.—Javelle water, used to remove tea, coffee, grass, and fruit stains from linen, is made thus: Mix well in an earthen vessel one pound of sal soda, 5 cents worth of chloride of lime and two quarts of soft water.

INSANITY AND SEX.—The Medico-Legal Society of New York City has sent out circulars containing questions to be submitted to those in charge of insane patients, with a view to finding out what proportion of the insanity in this country is the result of sexual causes. The chairman of the committee in charge of the inquiry is Edward W. Chamberlain, 120 Broadway, New York City, who will be glad to hear from any one having facts on the subject in question to communicate.

CHEMISTRY'S TRIUMPHS.—A scientist of this city said recently concerning the alleged corner in sugar: "Let these cornerers beware. We are now operating in the domain of chemistry to procure various articles of food from inorganic substances, and a substitute for sugar, known as benzoic sulphinate, is now attracting the notice of chemists. Its sweetness is 300 times that of sugar and it is a purely inorganic compound. The discoveries of modern chemistry will hereafter be utilized more than they have yet been in the way of providing food for mankind."

IF YOU ARE SICK and cannot raise your head, use the **IDEAL FELT Tooth Polisher**

to greatly add to your comfort.

Tabasco Pepper Sauce

OR LIQUID PEPPER.

Is simply the Pulp of the Ripe Pepper Extracted by Pressure.

The seed of this Pepper was obtained from Central America, and by careful cultivation in Louisiana for many years has been so improved in strength, flavor and aroma, as to have become a new variety of Red Pepper, superior to all others. The pulp is so handled as to retain all the flavor, strength, aroma and color of the ripe fruit, and to keep unimpaired in any climate. It excites the appetite, promotes digestion, and is pronounced, by connoisseurs, to be the finest condiment in the world. For medicinal purposes it recommends itself by its purity, strength and diffusible form.

MALTINE

MALTINE is far superior in nutritive and diastatic value to any Malt Extract manufactured in the World. There is no reconstructive that excels Maltine in Phthisis and many wasting Diseases.

MALTINE in its different forms is the only malt preparation we now employ, being so palatable, digestible, and easily assimilated. Of its efficiency in appropriate cases there is no more doubt in our minds than there is of the curative power of Quinine, Cod Liver Oil, the Bromides, and the Iodides.

It deserves to stand in the front rank of constructives, and the constructives by their preventive, corrective, and curative power are probably the most widely useful therapeutical agents that we possess.

PROF. L. F. YANDELL.

MALTINE is a valuable food, a food of priceless value at times of emergency. In fact, in very grave gastric cases it is a food which may be often resorted to when at one's wit's end what to do.

J. MILNER FOTHERGILL.

Out of 14 trade samples of Malt Extract examined by Messrs. Dunstan & Dimmock, ONLY THREE possessed the power of acting on starch. These brands were **MALTINE**, Corby's, Stacey & Co.'s Extract, and Keppel's Malt Extract. **WILLIAM ROBERTS, M.D., F.R.S.**

I have subjected "Maltine" and all other leading "Extracts of Malt" to an exact quantitative comparison of their diastatic activity. The results demonstrate conclusively the far greater diastatic value of Maltine, and enable me to state, without any qualification whatever, that it far exceeds in diastatic power any of the six preparations of Malt which I have examined. **R. H. CRITTENDEN.**

Professor of Physiological Chemistry in Yale College.

At the International Health Exhibition held in London, England, the only gold medal and the highest award of merit were given to Maltine by a Jury composed of the best chemists in Europe, and recent analyses made by the most reliable authorities in Europe and America prove conclusively that Maltine—in nutritive and diastatic value—is superior to all other malt preparations now in the market.

NOTE.—Physicians will observe that Maltine, as now prepared, is not so viscid as formerly made, being of a more fluid consistency; and, while retaining the nutritive and diastatic value which has given it precedence over all other Extracts of Malt, it is rendered entirely agreeable to the taste of the most fastidious, and is more easily administered. As now prepared, we positively guarantee that Maltine will not ferment or congeal in any climate or at any season of the year.

COMPLETE LIST OF MALTINE PREPARATIONS.

MALTINE (Plain).	MALTINE with Phosphates, Iron
MALTINE with Alteratives.	Quinine, and Strychnin.
MALTINE with Cod Liver Oil.	MALTINE Ferrated.
MALTINE with Hypophosphites.	MALTO-YERBINE.
MALTINE with Peptones.	MALTO-VIBURNIN.
MALTINE with Pepsin and Pancreatin.	MALTINE with Cascara-Sagrada.

Physicians may obtain Maltine from all druggists in every part of the world. In cases where the physician intends to prescribe Maltine, the word "Maltine" should be written, and not simply the words "Malt Extract," or "Extract of Malt."

Send for Pamphlet giving comparative analyses by 100 of the best Analytical Chemists in this country and Europe.

We will be happy to supply any regular practitioner with eight ounces each of any three Maltine compounds that may be selected from our list, providing he will agree to pay express charges on same.

FAC SIMILE OF THE LABEL OF

THE BEST SCOURING AND CLEANING SOAP
IN THE WORLD.

Costs as much to manufacture as Sapolio, yet sells at about half the price (\$2.75 per box of 72 cakes). Can be retailed for as much with equal or better value to the consumer, although it is generally sold at 5 cents a cake. Cut this out and ask your Jobber to send you a box of *Pride of the Kitchen*. It is worth trying.

[FLUID.]

**COLDEN'S
LIQUID
BEEF TONIC.**

**AN INVALUABLE AID IN THE TREATMENT OF
ALL CASES OF DEBILITY.**

Established 15 Years. Endorsed by Scores of Physicians.

Essentially Different from all other Beef Tonics.

Beware of Imitations.

COLDEN'S LIQUID BEEF TONIC consists of the Extract of Beef (by Baron Liebig's process), spirit rendered non-injurious to the most delicate stomach by extraction of Fusel Oil, soluble Citrate of Iron, Cinchona, Gentian and simple aromatics. An official analysis of this preparation by the eminent chemist **ARTHUR HILL HASSELL, M.D., F.R.S.**, and an endorsement by **SIR ERASMUS WILSON, F.R.S.**, is printed on the label of each bottle.

Its Range of Action Embraces all Cases of Debility.

By the urgent request of several eminent members of the medical profession, I have added to each wineglassful of this preparation two grains of **SOLUBLE CITRATE OF IRON**, and which is designated on the label as "No. 1," while the same preparation, without Iron, is designated on the label as "No. 2." It acts directly on the sentient gastric nerves, stimulating the follicles to secretion and gives to weakened individuals that first pre-requisite to an improvement, an appetite.

I will, upon application, send a sample bottle of Colden's Liquid Beef Tonic to any physician in regular standing. Please ask your Dispensing Druggist (if he has not already a supply) to order it. In prescribing this preparation physicians should be particular to mention "COLDEN'S" viz: "EXT. CARNIS, FL. COMP. (COLDEN). It is put up in pint bottles and can be had of Wholesale and Retail Druggists generally throughout the United States.

A BEEF BOOMERANG.

The Western dressed beef traffic has been given a setback by the discovery of Cattle Inspector Rast that diseased live stock in a terrible condition had escaped the inspectors who are charged with the duty of inspecting cattle at the Western live-stock markets. There were seventeen cattle in one car all afflicted with lump-jaw, and an attempt was made to escape the local inspector at East Buffalo. The cattle came from Kansas City and were consigned to the Jacob Dold Packing Co. Instead of unloading at the usual place the car was run around on Dold's slaughter-house switch. The East Buffalo cattle men discovered the condition of the cattle and notified the Health Authorities. Dold's men claimed that they were going to reship the cattle West, but Inspector Rast consigned the carload to the fertilizer factories. Dr. Dorr said, after inspecting the cattle, that if a needle were run into one of the diseased lumps and a man were then inoculated with it it would cause his death. This disease is of a virulent type and the flesh of cattle afflicted with it is poisonous. This case is regarded by East Buffalo live-stock men as an argument in favor of passing the bill pending in the Legislature compelling the slaughtering of live stock in this State, and shutting out the Chicago dressed beef monopoly. Friends of the monopoly say that no diseased

cattle could get through Kansas City or Chicago. One of the leading live stock men said: "If there were any kind of inspection in Kansas City those cattle would have been condemned and not allowed to get as far as Buffalo. The authorities here, and in fact in all other cities, kick pretty hard if a small pox patient is let loose upon the town from another city, and there is little difference when it comes down to health. Do you, or any live man, imagine that they cut tenderloins out of fine, healthy cattle up there and pack them in cans for the New York market? Not much. That Western beef can't hang alongside of home-butchered beef half the time before it is unfit to eat."

The above sensational paragraph, embellished with a variety of stomach-curdling head lines appeared in all the papers of this city on the morning of Sunday May 5th. It purported to be a despatch from Buffalo of the preceding day. We reproduce the screed in order to append to it the single statement that the only meat traffic which has received any set back in the manner above related, and which justly deserved it, is the meat traffic in Buffalo. The carload of cattle here referred to was evidently the refuse of Western cattle yards, which could not pass the rigid inspection there, and could not have been sold to the Western beef-dressers. The Jacob Dold Packing Company to which this carload of poor miserable stock was consigned, is not one of the so-called "Big Four," and has no connection with any of the firms generally included in the "Big Four." The cattle should have been inspected by the inspector at Buffalo, but owing to the defective regulations of the Buffalo stock yards, were surreptitiously run on Dold's private track, and but for an accident would have escaped detection. Such a thing could not possibly occur under the stringent rules of the Chicago stock yards. This incident proves the advantages of National inspection over local inspection, and, also the greater care exercised in Chicago than in Buffalo, and further shows what may be reasonably expected in Buffalo under a State inspection law. Again, Dr. Dorr, of Buffalo, is entirely wrong in his statements as to the disease called lump-jaw. It is purely a local parasitical disease of an ulcerative nature and does not affect the meat of the animal in any way, though it looks sufficiently repellant to prevent any decent beef-dresser from purchasing such cattle. In Chicago they would be at once seized and consigned to the rendering tanks. It is thus readily perceptible how this sensational story, aimed at the Western beef-dressers, has reacted against the dishonest tricksters who sought to impart to it an entirely different significance.

WHAT THE STATE BOARDS ARE DOING.

The secretary of the Michigan State Board of Health has just issued his sixteenth annual report. The most important article in the report is a paper in which reports of sickness and meteorological conditions are so grouped as to show the relation of certain meteorological conditions to diseases of the lungs and air passages. This paper not only presents evidence concerning these diseases in Michigan, but also in the United States

armies, in the native troops of India, and in London, England, for a period of thirty years. These facts, gathered over wide areas, seem to show that influenza, tonsillitis, bronchitis and pneumonia have one controlling cause, viz., the inhalation of cold, dry air. The paper explains the order of succession of the cold-weather diseases, from a simple coryza, or common cold, to pneumonia. Tables and diagrams are also presented showing that a few of the communicable diseases, which, as a rule, gain access to the body through the air passages, are quantitatively related to the atmospheric temperature, almost invariably rising after the temperature falls and falling after the temperature rises. The writer's explanation is that the albuminous exudations which result from the inhalation of air colder than usual supply a place favorable for the reception and reproduction of the specific germs of these diseases. Other articles in the report deserving special mention are a document giving rules concerning the prevention and restriction of small pox, and especially a paper on communicable diseases. The reports compiled in this last article show that in those outbreaks of scarlet fever and diphtheria in Michigan, in which isolation and disinfection were neglected, there were four to five times as many cases and deaths as in those outbreaks where these precautions were taken. This evidence is all the stronger because it is in harmony with the facts collected during the previous year. Together, they indicate a saving during the two years of 11,180 cases and 1,635 lives by restrictive measures in these two diseases.

THE BIG MEAT COMPANY.

A great deal of free advertising has been given lately to the American Meat Company. The scheme amounts briefly to the fact that some wealthy men connected with the Standard Oil Company and Cottonseed Oil Trust, interested in Western cattle ranches which were not so profitable as they were expected to be, generously concluded to allow the confiding public to take them off of their hands. They gilded the glittering hook with the bait of a direct meat supply company. Having made a serious mistake in their first effort by employing an official who could not possibly be of any value to the company, they now reorganize, put an ex-United States Senator at the head of the new concern, and a Congressman in the board of directors, and are ready to receive the people's investments. The real motives and objects are cunningly hidden behind pretended secret wire pullings, which are exposed with a great show of seeming reluctance. Dark hints of plots by the Cotton Seed Oil Trust, and counterplots by the "Big Four" of Chicago, with alternate checkmates are put forth in order to make the investing public believe that there are enormous future profits to fight for. We wonder whether it does not occur to such speculators looking for investments in apparent monopolies with brilliant prospects, that whenever investments of that character are to be made, the capitalists

30 Shaves

for 2 Cents.

Send a two cent stamp to Colgate & Co. 55 John St., New York, who will mail you a sample of this superior soap sufficient to last a month,

of the Standard Oil Company have money enough to keep the bonanza among themselves, and would not need any outside help. To be invited by such men to invest in what they don't want themselves, suggests that they believe in the old adage of a fool and his money being soon parted.

THE INSPECTION HUMBUG.

The Missouri Legislature on the 3d inst., rejected the beef inspection bill, which the agitators of that measure were so confident would become a law in Missouri. The same adverse action had already been taken in Ohio, Nebraska, Connecticut, Pennsylvania, and will doubtless be followed by New York. How the great Constitution annihilators have petered out! The public are the gainers wherever the foolish proposition has been repudiated. The case of Minnesota is directly in point. In that State it was positively declared by the friends of the inspection bill, when they were working for its passage, that if it became a law the consumers of meat would not have to pay a cent more for their steaks and roasts than before its adoption. The bill became law, and the "Big Four," the Chicago and Kansas City monopolists, who supplied the State with cheap and tolerably good beef, were shut out, and the Twin Cities were left to the care of a home industry. A despatch from St. Paul says that in that city and Minneapolis "the supply of meat has been curtailed, and the price of beef has gone up from 2 to 3 cents per pound. There is also reported an absence of what is known as "fine cuts"—surloins, ribs, and porterhouse steaks. The retail butchers do not appear to have made any perceptible change in their scale of prices, but it is noticeable that the quality of the meat has deteriorated. Where the consumer could formerly obtain a fine cut for 12½ cents per pound he is now charged that price for an inferior piece.

PLUMBERS vs. DOCTORS.

The opinion, and it is to be hoped it is one that will be verified in spirit at least, is expressed by the *Sanitary News*, that the time will come when the plumber will be employed as the family physician is, and have reposed in him the same confidence. Intelligence is fast reaching that point, and it will soon be learned that more visits from the plumber will make fewer visits from the doctor necessary. Regular visits from the plumber for the purpose of inspecting the plumbing and keeping it in good repair will take the place of the regular visits of the physician for the purpose of curing the ills of the body, caused by the defects of the

plumbing. Out of all the cases reported where sickness has been caused by defective plumbing, or plumbing out of repair, not one would have occurred had a plumber been called in time. This would have prevented the suffering and loss of time caused by sickness, and at a much less expense than that caused by the necessity of medical attendance.

THE NEW YORK STATE BOARD.

The New York State Board of Health held its annual meeting in this city on May 8, and re-elected all the officers of last year. Dr. Balch, of Albany, the Secretary, said in his report, that the board examined into the healthfulness of cotton seed products for food, reaching the conclusion that there was nothing injurious in them. The sanitary condition of the State was reported to be much improved. The number of deaths for the first quarter of the year was 26,000, a little less than for the corresponding period of the previous year. Seventeen per cent. of the deaths were due to zymotic diseases. Scarlet fever had been more prevalent than usual. There had been a marked decrease in the number of deaths from diphtheria, and small-pox had almost disappeared.

FILTERING DRINKING WATER.

THE INADEQUACY OF THE AVERAGE FILTER TO PURIFY THE LIQUID.

(Continued.)

The method employed is a simple one. Usually one cubic centimetre of the water to be tested is added to ten cubic centimetres of nutrient jelly, made by solidifying very nutritious beef tea by the incorporation of one-tenth its weight of gelatine. Everything being done with rigid precautions, the water to be tested is added to the nutrient jelly, which has been softened by being warmed to a little more than 30 deg. Centigrade. This is then quickly mixed and poured upon a cooled glass plate, where the fluidified gelatine soon becomes quite solid. Then the germs in the water, being scattered evenly throughout the mass, exercise their functions of rapidly multiplying at the room temperature; and, in the nutritious medium, the minute microscopic individual has perhaps by the third day become a dot as large as a pin-point, or much larger, containing thousands or millions of newly formed bacteria. These are called "colonies," and vary considerably in appearance, as will be seen by comparing the plates made with various waters. With a glass ruled into centimetre squares the number can be counted or estimated. If a large number of thousands be present, as in waters artificially prepared for tests and in sewage contamination of water, the only way to arrive at an accurate estimate is to employ in the eye-piece of a microscope a micrometer square, as first used, I believe, by Dr. Edw. K. Dunham, who combines with it the aid of an automatic counter. After determining the number, we isolate and identify the species as in general bacteriological study. There are many features of the subject which must be omitted in a paper of this scope, for they may not interest all, while the limits of the usual time allowed must be respected; and as the important points are to be discussed by eminent experts, I will not linger over the still unsettled question as to the absolute value of mere numbers of ordinary water bacteria in determining the sanitary merits of a water. It is, however, admitted that the fewer the varieties present, the less is the likelihood of sources of contamination affecting the water. In examining a considerable number of samples of water from various sources, I have observed that the less chance of contamination there was, the fewer bacteria have I found in the waters. Thus, fine mountain lakes and springs have never in my experience, unless under very unfavorable conditions, shown as many as one hundred bacteria in each c. c., while the same quan-

tity of water from a river draining thickly peopled valleys may show more than fifty times as many. While it offers less striking extreme differences than I have seen in the Hudson Valley and elsewhere, the Passaic water-shed may be briefly instanced as illustrating what I have just said. I give it because it is the smallest one near us offering every phase of importance in this connection, and because the subject of a supply to come to New York from that source has been seriously considered. The best of the upper lakes of this system showed on a pleasant day of the past winter only fifty-seven germs developing in the nutrient gelatine, while the Pequannock and other tributaries into which these lakes flow showed, in the samples collected as nearly at the same time as possible, over three hundred and fifty germs, which number increased as the water was taken further down stream, while at the Passaic Falls, in Paterson, over a thousand were detected in each c. c. Water from the hydrant in Newark, at the same time, showed nearly four thousand germs of bacteria in each c. c. The Newark water supply is at present derived from the Passaic, some miles below the place where sewage from Paterson is discharged into the river. As in chemical, so in bacteriological water examinations, those who have had the broadest experience and who are most careful are best in a position to pronounce an opinion. Apart from any personal equation, there are still limitations to the entire comprehensiveness of the method. I may mention that bacteria are recognized as present in the human body and in its products and changed tissues, which bacteria are never found to live on the gelatine or other water plates. Then, too, a water may be submitted for examination when all the obvious infection has disappeared, or has become exceedingly diluted, and hence a most painstaking test then fails to reveal the presence of the characteristic micro-organism. The period of incubation, after the infection and before the symptoms are recognized, may in Asiatic cholera occupy the greater part of a week, and in typhoid often lasts for two weeks or more, so that all traces of the harmful bacteria may have left the water before it is suspected. By reason, also, of its likeness to various harmless species, and its tendency to be overwhelmed by other more rapidly developing forms, the "colony" of the disease-producing species may be hard to identify. In this respect typhoid is decidedly more difficult than cholera to recognize in ordinary water. For those who believe that bacteria of certain kinds living in water, and with this introduced into the alimentary canal, can in many cases induce disease, this test, being so precise and delicate as it is, must appear the best way of determining whether the filters and other means in common use are efficient or otherwise in removing the dangerous elements from impure water passed through them—in short, whether they act as "disinfectants" of the water.

As various other agencies are used in conjunction with, or as supplementary to, filtration, it is proper that I here indicate how far they serve to purify drinking water. One of the most prevalent means directly resorted to for this ostensible purpose is the admixture of wine (usually red). Adding this to an equal amount of Croton water, I find that a varying proportion of the bacteria are killed, sometimes less than half, even after the mixture has stood for days. The spirituous alcoholic beverages (having from 45 to 68 per cent. of alcohol), mixed with Croton hydrant water in equal parts, cannot be depended upon to kill all of the bacteria, especially when "earth" bacteria are present, and a small percentage of whiskey (less than 20 per cent.) has very little effect in this direction. In malt liquors, as lager beer, the prolonged boiling in the brewer's kettle has destroyed the bacteria of the original water, even if they be of the most harmful and resistive species which we meet here. Various kinds, however, if present in vats, kegs and bottles (because of imperfect cleansing), will live in beer. Almost all the artificial mineral waters that I have examined are made of unsterilized water. Pressure of carbonic acid gas, and contact with it for

days, reduces greatly the number of bacteria in a mineral water, yet the typhoid bacillus and others will live for days in Seltzer water. In New York I have found many bacteria in the few carbonated beverages that I have examined.

Of the various acids which it is occasionally safe to employ, chemically pure hydrochloric acid must be used in the strength of at least one-half of one per cent. to destroy all the germs in Croton water to which *B. subtilis*, *B. typhoid*, and other bacteria have been added; and may fail to sterilize the water even after hours of standing thus acidulated. Sulphuric acid is more than twice as potent, and usually in the strength of one part to five hundred of water will render this free from living germs. Sometimes, however, it has to be used still stronger, as it is in a certain extensively advertised nostrum, exposed in the AMERICAN ANALYST some time since, in which, under a fanciful name, it plays the principal part. Alum, lime, and the other chemicals which, by inducing sedimentation of organic and mineral constituents, carry down many of the bacteria in water, do not (as is often believed) insure the annihilation and destruction of organisms present. It is the mechanical action of the film, which the presence of a minute amount of these causes to settle sooner than would otherwise occur upon sand in certain large sand filters, which insures their excellence, and the scarcity of bacteria must here not be attributed to a coarse chemical action. When chemicals are added in sufficient strength to destroy speedily all the bacteria which may be present, the water thus treated cannot be recommended as a beverage.

(To be continued.)

METROPOLITAN PRICES.

HOW THE COST OF FOOD VARIES IN NEW YORK.

For any individual to glean for himself the prices of the necessities as they vary in this city would be a matter of almost absolute impossibility, for different sections of the city have separate schedules of rates for the same articles as radically different as might be found in towns many leagues apart. Various causes operate to produce this. The prices of rents in the various localities, the population of the districts, the amount of competition in the business, all enter into the calculation which regulate the prices charged. Each district in the metropolis forms, as it were, a separate little town in itself, beyond the limits of which resident housekeepers rarely go in search of articles of food. The wife, as a rule, accepts the prevailing prices, and takes it for granted that what she pays for her goods may fairly be assumed to be the general market rate. In this she is frequently in error. Not only do the individual stores in different localities vary in their prices, but what is more singular, the markets in the various sections do likewise. That the public may have some idea of just what the ruling prices are in this city to-day and just in what section the most profitable purchases may be made, the New York Press has made a thorough canvass of the city with the following results. They are worth studying from points even other than economic. The prices sought were those asked in reliable places for articles of food in the lines of meat, eggs and vegetables. The storekeepers were wholly unaware of the object or purpose of the reporters, and the rates given were precisely those at which the goods are being retailed. Each reporter was furnished with the same list of articles to be asked for. It contained sliced ham by pound, whole ham by pound, shoulder of pork, butter, eggs and potatoes. The investigation is interesting by reason of the differences in prices which it exhibits. There is a well-defined gradation on both sides of town until a point about Thirtieth Street is reached, when for some blocks there is a little mountain of advance. Then the scale lowers as you go into Yorkville, and in Harlem the

prices are still a little lower. Washington Heights, perhaps, presents the best illustration of the theory that the wealth of the customer enhances the value of what he desires to eat, for within almost a stone's throw there is an increase of nearly two cents a pound on all meats. Washington Market, perhaps, all in all, makes the lowest average schedule, and the same remark will apply to the stores ranging on the far down-town west side. Rib roasts that may be purchased there at 12 and as low as 10 cents per pound will cost in the fashionable up-town districts from 18 to 22 cents, while the rump steak that satisfies its patrons in the ordinary walks of life at from 12½ to 14 cents per pound tickles the palates of the brown stone front at the modest figure of 18 cents. Sirloin is from 4 to 6 cents dearer as well, while the turkey refuses to sacrifice itself on the spit up-town for less than 5 and in some instances 7 cents more than it would consent to do the same thing for in quarters less fashionable. Midway on the west side, or rather, less than midway, the prices are, it will be noted, just about a medium between those of the down-town and the up-town main provision dealers. Rib roasts form the only exception to this. Whether it be that they are less sought for up-town or are more highly prized in lower Sixth Avenue and the blocks west of it, it is a fact that they sell for 4 cents more than they do a quarter of a mile lower down, and only 2 cents less than in the most fashionable quarters of the city. Jefferson Market preserves a fair average, and Clinton Market, at Canal and Spring, on the North River, is only a shade cheaper. Just at about a point corresponding to this, but on the east side, the prices, somewhat strange to say, are very considerably lower. For instance, over on Avenue C sirloin steak, which rates at from 18 to 20 cents in Jefferson Market, can be purchased for from 12 to 14 cents, while mutton is only 6 cents lower. Leaving the hotel and club and fashionable district so-called, and going nearer the homes of the people in Yorkville, we find a decided inclination to lessen prices in everything. Even sliced ham, which is somewhat more uniform than the other articles, yields to the general feeling, and sells for 2 cents per pound less than it does below Fifty-ninth and above Fourteenth Street. Roast rib is also lower, 1 cent per pound. Going still further up-town into Harlem, we find turkey reigning at an exact average of 15 cents. Rib roasts grow just a little in favor and in price, but rump steaks and sirloins are cheaper than they are anywhere else in the city, except on the far east side well down toward the tenement quarters. People in Harlem pay 4 cents per pound less for very fair sirloin than do the people in Yorkville, and 6 cents per pound less than those who live on the aristocratic Washington Heights and in the centre of the town. A somewhat curious feature on the west, and indeed the same on the east side as well, is that the prices gradually decrease as you go from the central avenues. On the extreme west side the prices range from 1 to 2 cents per pound less on an average than they do nearing Sixth Avenue on the one side and Third Avenue on the other. Fulton Market and Catherine Market are fully up to the average prices paid over the city.

FOOD PRESERVATIVE.—A much better preservative of food than the boric acid, etc., now used for keeping fish should be had in sterilized infusorial earth, in the opinion of Professor P. Wagge, the Norwegian chemist. Enormous deposits of this earth were discovered in Norway last year.

COMBINATION METERS.—The *Electrical World* says that there used to be such a prejudice against gas meters that consumers of electricity did not like to have their electrical meters put anywhere near their gas meters, lest the new gauge might contract bad and lying habits from the old one. The electric meter has a reputation as good as that of the gas measurers is bad. Now an ingenious fellow has turned up with a patent for a combination gas and electrical meter, as accurate in its workings as a pair of jewelers' scales.

MEASURING PAIN.

RECORDING THE SPEED OF A RHEUMATIC TWINGE.

The University of Pennsylvania is the pioneer in introducing the mind-measuring system into America. Prof. Cattell recently brought with him from Germany some quite remarkable instruments, principally of his own invention, which are to be hereafter employed in demonstrating his psychological lectures. They perform tasks which materialists have scouted as impossibilities, and strongly tend to prove that psychology, despite all that has been said to the contrary, is an exact science. One of these instruments will calculate to a nicety the traveling speed of an impression. A chronoscope and a voltaic battery are the principal agents in the solution of this intricate problem. By their means registration is made of the exact time that elapses between the occurrence of an act and the sign given by the subject operated upon that he has perceived the act. By a process of subtraction the time is discovered which passes between the moment at which the impression reaches consciousness and the moment when the subject knows that he perceives. In this manner a man's rapidity of perception—his ability to see, taste, smell, hear or feel—may be accurately determined. For the measurement of sound the subject forms a circuit by applying his hands to the two poles of the battery. On hearing a specified noise he instantly breaks the circuit. Immediately the hand of the chronoscope stops short, indicating in thousandths of a second the time that has elapsed between the occurrence of the sound and the breaking of the circuit. On this basis man's perceptive power is calculated. By analogous means the comparative swiftness of sight is measured. Prof. Cattell has ascertained, for instance, that one-tenth of a second suffices for him to perceive a color, one-eighth of a second is necessary for the perception of a letter, and one-seventh of a second for a word. The strength of a person's memory is determined by a complicated machine which presents to the eye at intervals of a second, flashes of light of varying degrees of intensity. The more subtle is a man's power of recognition, the more readily he distinguishes one light spot from another, and the longer he retains his impressions. In this way the mind's concentration and retentiveness are measured in fractions of a second. By means of the gravity chronometer the comparative ease or difficulty with which letters or words may be perceived is demonstrated. In a sliding screen moved by electricity a slit five inches wide is inserted, behind which an object is exposed to view for an infinitesimal space of time. In a series of experiments with the letters of the alphabet the time of exposure was one-thousandth of a second. Out of 270 trials W was seen 241 times, while E appeared seen but 63 times. Of other capital letters Z, M, D and H ranked next in succession after in the quickness with which they were perceived, while V, F, U and J were observed only with great difficulty. Of the small letters d is the most easily recognized, and s least easily, the former being perceived three times as often as the latter. If the several colors are exposed to view in like manner for a fraction of a second, orange and yellow will be clearly perceived. Blue, red and green follow in the order named, violet being the least easily recognized and requiring two or three times as long exposure as the bright colors. This device is of great value in measuring the range or complexity of the mind.

DRESS BAGS.—Ladies with choice dresses now order a bag with each dress, just as a gentleman orders a pasteboard box with his new high hat. These bags are made of common muslin or other lining material, and close at the top with a shirr string. The ends of the shirr string are run through loops in the belt of the dress skirt and waist, and when the bag is closed it can be hung on a nail in a closet secure from dust and moth and every other evil agency except thieves and pretty servant girls with a penchant for wearing madame's clothes.

WALL PAPER DANGERS.

A HYGIENIC SUBJECT TOO OFTEN NEGLECTED.

The *Sanitary News* calls attention to the unhealthfulness of the customary practice of dealing with the walls of our houses. Allusion is made to the outcry of a few years ago against arsenical wall papers, and it is asserted that other conditions of our walls and ceilings are far more deadly. People are urged not to paper their walls, but if they will do so to remove the old coats of paper and paste before applying new coats. It is a well known fact that flour paste will soon mold; that it is a ready absorbent of moisture and disease germs; also that paper is a very ready absorbent. They may not be aware, however, that the coloring and bronzes, which are pulverized metals, brasses, etc., are only temporarily held upon the face of the paper with animal matter (glue) that soon decays, and glue is the greatest absorbent of moisture, and the natural culture ground for the germs, and if these little pests get sufficient heat while there they will flourish, and the rooms are sometimes very warm above the lines of the doors and windows with a moderate fire; and where repeated coats of this paste, paper and glue are applied, from which outdoor air with its purifying effects are excluded, by the respirating pores being sealed or strangled, the danger is much greater. The glue soon rots sufficiently to allow the air or any friction to remove small particles to which these germs have attached themselves to float about the room unseen, until they lodge in the system of some unsuspecting victim, whose physical condition is such that they take effect; then they still have the little particles of fertilizer with them to help give them a start on their deadly mission. The practice of calceining and painting walls is also condemned, although it is preferable to paper from a sanitary point of view. By any methods in use the pores of the walls are closed, and the purifying process of the air passing through and through them is cut off. By this showing it would appear that undecorated walls, unsightly as they are, are the only healthy ones to live within.

MILK NATURAL AND CONDENSED.

A FEW EXCERPTS FROM DR. E. H. BARTLEY'S REPORT TO THE BROOKLYN BOARD OF HEALTH.

The milk of feverish animals is always abnormal in composition, and should not be given to young children. In general, this change in composition consists in an increase in the albuminoid matters, and a decrease of the sugar and fat. The milk of cows suffering with pleuro-pneumonia should be carefully excluded during the acute febrile stage, for the above reason only. The same remark applies to all non-contagious diseases. Tuberculosis, on the other hand, may render the milk infectious, especially when the udder becomes involved. The evidence upon this point grows stronger year by year, and makes this disease among milch cows a matter of great importance to sanitarians. As chemical analysis cannot detect the changes in the milk due to disease of the animals, when mixed with the milk of healthy cows, it becomes a matter of necessity that the health of the cows in milk-producing regions should be carefully watched, and the milk of all diseased animals carefully excluded from the market.

CONDENSED MILKS.

Condensed milk, in recent years, has become a staple article of food. There is undoubtedly an important place filled by this popular food. When first introduced, it was felt that a long needed reform in milk supply had come. It soon met with a ready sale, and then competition began to spring up. Physicians had begun to recommend it as a food for infants, in place of the more or less variable cows' milk, especially in large cities, because of its supposed uniformity, and because experience had shown it to be a good substitute for the above. From certain clinical experiences, I have for some time been somewhat lukewarm in its praise as a food for in-

fants. I began to suspect that it was not always uniform in quality and purity, and, therefore, requested the chemists of the Department to make an analysis of cans bought by myself in the market. The brands examined were the "Rose" brand, the "Crown" brand, the "American Swiss" brand, "Canfield's Condensed Milk," "Borden's" from wagon, and the "Eagle" brand. The following is the result of the analyses:

No.	NAME.	SPECIFIC GRAVITY.	SP. GR. OF MIXTURE.	FAT.	SUGAR.			WATER.	ASH.	ALBUMINOIDS BY DIFFERENCE.
					MILK.	CANE.	TOTAL.			
1	S. W. Canfield	1.281	1.0740	6.30	9.87	38.07	47.94	27.85	1.86	16.32
2	{ Eagle Brand, N. Y. Condensed Milk Co.	1.277	1.0742	5.35	10.89	46.49	57.38	28.27	1.87	7.68
3	{ Rose Brand, N. Y. Condensed Milk Co.	1.287	1.0756	6.48	8.29	45.49	53.78	21.53	1.81	16.40
4	{ Crown Brand, N. Y. Condensed Milk Co.	1.277	1.0728	5.48	7.54	45.76	53.30	19.97	1.80	17.96
5	{ Borden's (from wagon)	1.145	1.0324	8.23				55.66	2.35	
6	American Swiss	1.289	1.0761	6.35	8.47	37.37	45.84	22.54	1.79	23.48

In reviewing the above analyses of condensed milks, we will consider but two points: first, as to whether the condensation had been carried to the point claimed; and, second, as to whether a portion of the cream had been removed from the milk before condensation. It is claimed by the condensed milk companies, that the milk is evaporated to one-fourth the original volume; or, that by the addition of three parts, by volume, of water to one of the milk, the original uncondensed milk is obtained. If we divide each of the ingredients, except the water, in the above table by four, we have the result expressed as follows:

NUMBER.	1	2	3	4	5	6
Total Solids.	8.51	6.31	8.24	8.57		10.02
Fat.....	1.58	1.34	1.62	1.37	2.06	1.59
Sugar.....	2.47	2.72	2.07	1.88		2.12
Casein.....	4.08	1.92	4.10	4.49		5.87
Ash.....	.465	.47	.45	.45	.59	.45

The total solids in whole milk should be not less than

twelve per cent., while these vary from 6.31 to 10.02 per cent. The fat in whole milk should be between 3.2 and 4 per cent., the sugar about 4.5 per cent., the casein about 4.2 per cent., and the ash from 0.6 to 0.7 per cent. It is very evident, at a glance, that none of these milks, when diluted, according to directions, give anything like normal cows' milk. None of them seem to have been condensed to the degree claimed.

As to whether the milk had been partly skimmed. Koenig (*Nahrung und Genussmittel*, page 243) gives the general relation of the fat to the nitrogenous matter, in natural milk, as 100 to 100 to 110. As this relation is not disturbed in condensed milk, he recommends it as a means of determining whether or not a portion of the cream has been abstracted from the milk. Applying this rule to the figures in these tables, it would seem that, with the exception of No. 2, a portion of the cream had been removed before condensing. The same conclusion must be reached by an inspection of the second table above given.

To sum up then, the results of our analyses of the above condensed milks, we must conclude that a large proportion of them are not condensed to one-fourth the original volume of the milk. A considerable number of them are prepared from partially skimmed milk, as shown by the relation between the fat and the albuminoids. No process of dilution in these last cases, can produce an accurate imitation even of cows' milk, much less a resemblance to mothers' milk. They are, therefore, not to be recommended as a proper food for infants, because of the great excess of casein over the fat. Only one is here mentioned which appears not to have been skimmed. If further inquiry sustains the conclusions drawn by this limited number of analyses, the health of children should be protected from the harm likely to be done by such mixtures. If it is a common practice for manufacturers of the cheaper brands of condensed milks, to partially skim before condensing, it should be subjected to the same regulation that other skimmed milk is.

CHEAP BEEF.

EXPENSIVE RESULTS OF THE PROPOSED RESTRICTIVE LEGISLATION.

Since the passage of the meat inspection or anti-dressed beef by the Minnesota Legislature, the price of meat has advanced twenty-five per cent. at several points in the State. The Albany law-makers should think twice before bringing about such a condition of things in the Empire State.—*Utica Observer*.

In Minnesota, effect has simply followed cause, just as it always does there and elsewhere. It has been repeatedly pointed out in these columns that the passage of what is known as the dressed beef bill would enhance the cost of meat, and therefore be a curse to consumers. The advocate who contends that the circumscription of competition does not tend toward higher prices is either ignorant or dishonest. It is one of the inflexible laws of trade. Many pernicious bills have been brought to the attention of the present legislature, but few, if any, are more mischievous and objectionable than this one. The fact that the passage of the dressed meat bill would largely increase the price of meat is perhaps the most effective argument that can be employed against it, but there is a yet graver and more far-reaching objection, which we have previously urged, but is worthy of reiteration. The effect of legislation of this character is to stimulate the spirit of sectionalism and make the union weak and dissoluble. Interstate tariffs cannot be imposed without fracturing the bonds of fraternity. They would belie our boasted national unity, and be corroborative of the old states rights doctrine, the holders of which were stigmatized as Copperheads and Secessionists. We do not know that this feature of the bill has been presented at Albany, but it is perfectly patent that so soon as the borders of our commonwealths are lined with custom officers the disintegration of the republic will have begun. Political

divisions will follow commercial divisions, trade can no longer seek its normal channels, and in the end such legislation would prove destructive to the common interests of the country. An ex-Assemblyman expresses the opinion that the bill was conceived for the corrupt purpose of extorting a corruption fund from the great millionaire dealers of the West, in other words, that some of the members friendly to the bill are anxious to have certain tangible arguments employed to induce them to vote against it. Whether this is true or not is conjecturable. It cannot be true of any honest legislator. But his conviction justifies the suspicion that blackmailing bills are not an unknown feature of modern legislative methods. It is enough to know, first, that the dressed beef bill, if it were to become a law, would increase the cost of living and be an additional tax upon every family in the State; and, secondly, that it is *wrong in principle*. It ought to be buried at the very bottom of the many bad bills which deserve to find their way into the same dishonored grave.—*Troy Press*.

DOMESTIC DIETETICS.

SPECIALLY PREPARED, FROM PRACTICAL TESTS, FOR THE LADY READERS OF THE "AMERICAN ANALYST."

SEASONABLE FOOD.

May.

MEATS.—Beef, lamb, mutton, ham, kidneys, liver, sausage, veal.

GAME AND POULTRY.—Brant, pigeon, chicken, duck, turkey, goose, snipe,

FISH.—Anchovy, bass, catfish, cod, eels, clams, flounder, halibut, herring, lobster, mackerel, mussels, perch, porgie, rock-fish, salmon, shad, shrimp, turtle, trout, sturgeon, whiting, weak-fish.

VEGETABLES.—Artichokes, beans, carrots, garlic, lettuce, onions, parsley, parsnips, potatoes, shallots, spinach, turnips, water cress, radish, rhubarb, sea kale.

PRACTICAL RECIPES.

TOMATO SOUP.—Make a good clear stock the day beforehand. Take two quarts of the broth and a dozen large, full-ripe tomatoes, a bunch of herbs, and a quarter of a pound of rice. Scald the tomatoes and peel them first before introducing them. Let all come to the boil, and skim frequently. Reduce to about one-half. This makes rather thick soup. If a thinner soup is preferred, cook the tomatoes first, just as if for stewing. Cull out the rice, and add the stewed tomatoes to the broth an hour before serving, letting the soup simmer gently.

FRIZZLED MEAT.—Take meat that is too tough to boil, put it where it will freeze as hard as possible, then, with knife or machine, shave in small pieces; have a hot griddle or frying-pan, grease and put on the meat, turn quickly, then salt, pepper and serve with gravy.

DEVILED LOBSTER.—Boil about six pounds of lobster, and when cold pick it into fine shreds; to one-half pint of cream add one-half teaspoonful of ground mustard, a saltspoonful of cayenne pepper, saltspoonful of ground mustard, one-quarter pound of butter; boil this dressing, and then stir in the yolks of two raw eggs (beaten) until it begins to thicken, throw in the lobster and stir it until it is warmed through; put it back into the opened lobster shells, and sprinkle bread-crumbs and little pieces of butter over the top; brown in the oven; serve with lettuce leaves.

TOMATO TOAST.—Take fresh or canned tomato, stew and season with salt, pepper and cream, with a little flour stirred to a paste in a small portion of the cream

before adding to the rest, then toast slices of bread, spread them with butter, and spread on the tomato while hot and serve immediately.

VEGETABLE SALAD.—Chop up three good tomatoes, also a freshly peeled cucumber, and a white Spanish onion. Put them in a dish in alternate layers, with a sprinkle of pepper and salt on each layer. Pour some oil and vinegar over, and set it away in a cool place for an hour. Cover with some freshly grated bread crumbs, and serve at once.

RICE CHEESECAKES.—Mix $\frac{1}{4}$ lb. of ground rice with one pint of milk, stir over the fire till it becomes a paste, but it must not boil. Now add 4 ounces of butter, stirring till the butter is mixed. Next beat three eggs with $\frac{1}{4}$ lb. of sifted sugar and a grate of nutmeg. Mix well together, then add 4 ounces of currants, and a few drops of essence of orange. Line some patty-pans with puff-paste, dust a little sugar over them and bake.

LEMON CAKE.—One cupful of butter, two cupfuls of powdered sugar, five eggs, one-half a cupful of milk, four cupfuls of flour, three teaspoonfuls of Horsford's baking powder, the grated rind and half the juice of a lemon. Mix the butter and sugar to a smooth cream, then add the eggs and milk, then the lemon, and then the flour and baking powder, and bake in one loaf, one hour.

CHOCOLATE SOUFFLEE.—A quarter of a pound of grated vanilla chocolate, a quarter of a pound of almonds blanched and pounded, six ounces of sifted sugar, and the yolks of eight eggs must be stirred together half an hour. Whisk the egg-whites to snow, and stir them gently in with the rest. Butter a mould well, strew it with grated bread, put in the mass, and bake it an hour.

CHEAP CATERING.

A UNIQUE CO-OPERATIVE ENTERPRISE IN LIVERPOOL.

An instance of the principle of co-operation successfully applied is furnished by the history of the Liverpool Clerks' Cafe Company. This company was formed in the year 1884 for the purpose of catering for the wants chiefly of clerks who by exigencies of business was compelled to take the bulk of their meals in the city. The existing restaurants and dining rooms were either expensive or unsatisfactory in style of service and of food provided. The company aimed at combining the superiorities of the one with the cheapness of the other. At the outset of its career it had more than ordinary difficulties to contend against in the shape of prejudice and unfriendliness of the tradesmen of the town, and being managed entirely by a directorate selected from amongst the clerks themselves, certain drawbacks from inexperience were inevitable. That it has successfully surmounted all these is proof of the satisfaction which it affords and of the business-like lines on which it has been conducted. The company started with one cafe as a simple luncheon room, and has since gradually widened its operations to such an extent that it now practically controls the lunching, dining and teating of the commercial community in Liverpool. Its establishments, of which it has now seven in various parts of the city, are commodious and well-appointed, and the food provided is the best obtainable. Its effect has been to make Liverpool the cheapest and best of English cities in which a clerk can live. Formed primarily for the benefit of clerks, it now counts commercial men of every degree amongst its regular customers, and further than this it has caused a general reduction of tariff throughout the business parts of the city in other restaurants. Comparing what it costs clerks in city expenses five or six years ago with what they can now live at in similar style, it has been as good as an all-round increase of income to them. Yet it is

not a philanthropic enterprise by any means. From the very first it has been a sound business success. Its yearly dividend has been 20 per cent. on its paid-up capital; it has written off for depreciation over 20 per cent. on an average yearly, and has accumulated a reserve fund of some £1,500. Some idea of how close the margin between profit and loss is drawn is given by the investigation of one year's working, which revealed the fact that the net profit on each meal served during the year was but a halfpenny (one cent). This will also give some idea of the number of meals served to aggregate such results as this company has attained. The company was first registered with a capital of £5,000; the first issue was of 2,500 £1 shares. Its registered capital is now £20,000, of which 10,000 £1 shares have been issued. On these only 10s per share has been called in, but the market value stands at 30s to 32s 6d per share, or a premium of over 200 per cent. One secret of the success of this company is the manner in which shares have been allotted. At the outset the directors were able to fully allot their first issue and yet give to no single applicant more than five shares, preference being given at the same time to those most likely to be regular customers. A clientele was thus at once created. In succeeding issues of capital the same rule has been followed, so that each new room opened has in its vicinity a number of the company's shareholders largely interested in its success. Each room is under charge of a manageress (the whole of the working staff being of the gentler sex), and supervised by a visiting committee of the directors, the board being subdivided into committees for that purpose. This insures freedom from irregularities and constant state of efficiency which has made the establishments of the company so popular in Liverpool. An idea of the cheapness with which food is served, all being of excellent quality and ample portions being given, can be obtained from the following prices: All kinds of soup 2d per plate; fish 6d; roast sirloin beef, 8d; roast mutton 8d; steak pie, 8d; mutton haricot, 8d; roast veal, 8d; pork and apple sauce, 8d, and various other joints, 8d; chops and steaks, 8d; cold meats, 6d; ample variety of vegetables, 1d and 2d; pies and puddings, 3d; bread and butter, 2d.

NOTES ON IODIDE OF POTASSIUM.

The perfect impunity with which iodide of potassium has been administered by some of the most eminent physicians of Europe and America is worthy of note. Dr. John O'Reilly, Drs. Buinestead and H. C. Wood report having continued extremely large doses for a considerable length of time, in some marked cases, without having experienced more than temporary ill effects, which at once yielded when the medicine was suspended for a short time only. Messrs. Guillot and Melseus gave it to advantage in doses of from a drachm and a half daily, and continued it for several weeks in cases of lead poisoning and mercurialism. They believe that it acts by making the poisonous metals, which have become fixed in the system, soluble, and carrying them off in the secretions. In one or two cases where, after the use of iodide of potassium, salivation took place, it was clearly proven not to be the primary effect, but the secondary effect, through the releasing of the mercury already in the system. Dr. Geo. Balfour, of Edinburgh, was very enthusiastic in his reports on the use of iodide of potassium, ascribing successes to it which he believes he could not have obtained in any other way. He even used it in affections of the mucous passages, getting the benefit directly through its excretions through those membranes. Dr. Buchanan, of Glasgow, assures the profession that he has given it in doses of half an ounce. Iodine, the active agent in iodide of potassium, was first employed as a medicine in 1819 by Dr. Coindet, Sr., of Geneva. Dr. John C. Dalton, of New York, used it extensively. Drs. Lebert, Manson, Lugol, Boinet, Berthe, Lepage, Hutet, Brainerd, Fairthorne and H. W. Fuller all unite in speaking of the

use of iodine and iodide of potassium in the very highest terms, and all deny any injurious effects whatever. Taken in connection with a well-made extract of choice sarsaparilla, the efficacy of iodide of potassium seems to be very much increased, while any injurious effects whatever, if such are possible, are counteracted both from the nature of the sarsaparilla, which has a tendency to carry off any excess of the iodide of potassium with the other effete matter, and from the fact that a very much smaller dose of the iodide is necessary in that way. One peculiar fact may be stated in this connection. Although the use of sarsaparilla has been known since the middle of the sixteenth century, after a time it fell into disrepute, because it was not generally known how to select the best root and how to extract its virtues until it was re-introduced about a century ago by Sir William Fordyce. Now, again, owing to so much that is worthless going by the name of "sarsaparilla," it threatens to become unpopular. All this is obviated by taking the standard preparation of Dr. J. C. Ayer & Co., of Lowell, Mass, who use exclusively the Honduras sarsaparilla—the variety most rich in medicinal properties—and who have steadily maintained the excellence of their medicine for nearly fifty years.

UTILIZING ROOTS.—The network formed by the roots of the poppy has been found admirable for keeping railway embankments in place. It is extensively sown in France for this purpose.

GLASS BONNETS.—A Venetian glass manufacturer is said to be making and selling bonnets by the thousand. The glass cloth of which they are made has the same shimmer brilliancy of color as silk, and is impervious to water.

EAST AND WEST.—Ohio has 4,000,000 people, with \$14,000,000 in savings-banks. Maine has 660,000 people, with \$41,000,000 in savings banks. Ohio has \$3.33 to each individual, Maine has \$62 to each individual, in savings banks.

FEMALE DOCTORS IN RUSSIA.—The *St. Petersburg Gazette* believes that the question of lady doctors in Russia has been definitely settled in an affirmative sense, with the stipulation that ladies shall only attend on adults of their own sex, and on children of both sexes.

ELECTRIC POWER.—The installation of the electric motor as a means for stationary power is becoming more noticeable each year, and estimates carefully made rate the number of those in use at the present time for driving machinery in the United States at between 6,500 and 7,000.

STEEL HOOPS FOR BARRELS.—A corrugated steel hoop has been invented, which is said to be elastic and firm, hugging a package tightly. Four steel hoops will take the place of ten wooden hoops on a flour barrel. They are cheaply produced by the aid of electricity, a hoop being welded in two seconds. They are made at Worcester, Mass.

HIGHWAY ROBBERY.—Drug clerk: "I filled a prescription for a stranger last night for a dollar and ten cents, and this morning I find the dollar is a counterfeit."

Proprietor: "That's highway robbery again. Well, never mind, if the ten cent piece is good, we still make four cents on the sale."

THE ELECTRIC AGE.—Prof. Elisha Gray remarks that electrical science has made a greater advance in the last twenty years than in all the 6,000 historic years preceding. More is discovered in one day now than in a thousand years of the middle ages. We find all sorts of work for electricity to do. We make it carry our messages, drive our engine, ring our door bell, and scare the burglar; we take it as a medicine, light our gas with it, see by it, hear from it, talk with it, and now we are beginning to teach it to write.

SAWDUST PAPER.—An important experiment has been tried successfully at Ottawa, Ont. A mill has been established which makes paper pulp out of sawdust. It is now using all the product of one mill. The paper made wholly from sawdust is said to form an admirable sheathing that is fit for building after being

tarred and dried. A better quality is made by using one-fourth waste paper. The plant cost \$15,000, and consists of American machinery, with the exception of the grinders. The mill has a capacity for converting about 12,000 tons of sawdust into pulp annually.

ANCIENT IRON.—The oldest pieces of wrought iron now known are probably the sickle blade found by Belzoni under the base of a sphinx in Karnac, near Thebes; the blade found by Colonel Vyse, embedded in the masonry of the great pyramid; the portion of a cross-cut saw exhumed at Nimrod by Mr. Layard—all of which are now in the British Museum. A wrought bar of Damascus steel was presented by King Porus to Alexander the Great, and the razor steel of China for many centuries has surpassed all European steel in temper and durability of edge. The Hindoos appear to have made wrought iron directly from the ore, without passing it through the furnace, from time immemorial, and elaborately wrought masses are still found in India, which date from the early centuries of the Christian era.

NIGHT AIR.—An extraordinary fallacy is the dread of night air. What air can we breathe at night but night air? The choice is between pure night air from without and foul air from within. Most people prefer the latter—an unaccountable choice. What will they say if it is proved to be true that fully one-half of all the diseases we suffer from are occasioned by people sleeping with their windows shut? An open window, most nights in the year, can never hurt any one. In great cities night air is often the best and purest to be had in twenty-four hours. I could better understand shutting the windows in town during the day than during the night, for the sake of the sick. The absence of smoke, the quiet, all tend to make night the best time for airing the patient. One of our highest medical authorities on consumption and climate has told me that the air of London is never so good as after ten o'clock at night. Always air your room, then, from the outside air, if possible. Windows are made to open, doors are made to shut—a truth which seems extremely difficult of apprehension. Every room must be aired from without, every passage from within.—*Sanitary World.*

BUSINESS NOTES.

CHRONIC STARVATION.

Upon whatever other points they may differ, authorities on dietetics agree that nitrogen is the most essential of all foods, and that a certain amount should be taken regularly. Diminution of the quantity of food, whether from inability to procure it, or a disinclination for it, generally means decrease or absence of nitrogen. That this leads to dire results is a well-established fact. Graily Hewitt, in an address on "Chronic Starvation and Delicate Females," before the British Medical Association, said: "For the last ten years or more I have carefully inquired into the history of patients suffering with uterine and ovarian disease, or some affection incidental to child-bed, and I have found a continuous insufficiency of food, especially the nitrogenous, to have existed almost universally, so that I have naturally come to regard this chronic starvation as an important factor in disease." The serious trouble arising from insufficient nourishment are also shown in a marked manner in the case of delicate females during gestation, a large proportion of whom are so enfeebled by the constantly-recurring paroxysms of vomiting and the consequent diminution of food assimilation, that when the period of parturition arrives they are so reduced in strength as to be peculiarly susceptible to the attacks of disease incident to child-birth, and the offspring is ushered into the world puny and feeble, and especially liable to a complication of physical evils solely attributable to its starved and anemic condition. Golden's Liquid Beef Tonic contains precisely the elements indicated by Dr. Hewitt as being so essential, combined with soluble citrate of iron, cinchona and gentian, forming at once a palatable nutriment and reliable tonic, and its range of usefulness embraces all cases of debility of whatever origin. It has been in use fifteen years, and those who have used it most are most emphatic in its praise.—*Mass. Medical Journal.*

LACTOPEPTINE.

The most important remedial agent ever presented to the Profession for Dyspepsia, Vomiting in Pregnancy, Cholera Infantum, Constipation, and all Diseases arising from imperfect nutrition.

Lactopeptine precisely represents in composition the natural digestive juices of the Stomach, Pancreas and Salivary Glands, and will, therefore, readily dissolve all foods necessary to the recuperation of the human organism.

CAUTION

We regret that we are compelled to caution the profession in prescribing Lactopeptine, but very careful investigation has proven to us clearly the necessity of it. Substitution of cheap and worthless compounds are being made in many cases where Lactopeptine is prescribed.

Lactopeptine is always UNIFORM, and its effects are SPECIFIC, and no one has ever been able to imitate its digestive value. If you do not obtain positive results when you prescribe Lactopeptine, you can be sure that some substitution has been made, and in such cases it may be necessary for the physician to prescribe Lactopeptine in the original ounce package to insure certainty of obtaining the genuine article. We can confidently make this assertion, knowing the scrupulous uniformity in digestive value of every ounce of Lactopeptine.

Lactopeptine has always been kept strictly in the hands of the Medical Profession, never having been admitted in any publications but Medical Journals. It is prescribed by the most intelligent and educated physicians in all parts of the world, and there are but few physicians who have ever used Lactopeptine that will not agree with the late Prof. L. P. Vandell, when he says: "Lactopeptine is one of the certainties in medicine, and in this respect ranks with Quinine."

In the various forms of Dyspepsia, in vomiting in Pregnancy, and in Mal-nutrition of children, there is no known remedy so positive in results.

OUR MISSION.

WHAT THE AMERICAN ANALYST IS DOING.

FIGHTING ADULTERATION.

The steadily growing favor which the AMERICAN ANALYST is constantly receiving at the hands of both the reading and the business public is the best evidence that could be afforded of the useful field of effort it occupies. It was the pioneer journal in this country to take up the fight against adulteration, and stands to-day, by public acknowledgment, the only competent exponent of the principles involved in that momentous struggle. To this end the realm of sophistication and fraud has been thoroughly explored, and its corruptions, as far as practicable, exposed to the public view. Charlatans, adulterators, and handlers of poisonous food have been summarily and uncompromisingly dealt with. Humbugs seeking to enrich themselves, through the sale of high-sounding specifics for human ailments, have been subjected to the crucial test of thorough chemical analysis of their goods, and where the latter, as too frequently occurred, proved to be utter frauds in name, composition, and pretended effects upon the system, the real facts have been placed before our readers in order to save the public from further unconscious imposition. The veil of chemical mystery in which tricksters of this kind ostentatiously envelop their processes of manufacture, protects them as yet from the criminal laws to which other confidence operators are held amenable, and the only method for counteracting their nefarious schemes is through public exposure by the newspaper press. In exposing this species of fraud, the AMERICAN ANALYST has conferred a benefit upon the community, to which the latter is giving grateful and substantial recognition.

SANITARY AND FOOD REFORMS.

In addition to the foregoing, the AMERICAN ANALYST is in constant co-operation with the Boards of Health of this and other cities, in efforts to secure sanitary and food reforms through organized methods, and while it is nobody's mouthpiece, it is conceded to be the only pop-

ular medium through which those bodies can bring their purposes and action intelligently before the general public. Reaching as it does all classes—manufacturers, merchants, physicians, chemists and private families all over the land—its influence is exerted over a vast radius, producing results as visibly marked as they are widespread.

DOMESTIC DIETETICS

Is a department of special interest to ladies. It is very different and far superior to the ordinary cookbook, in that it tells the housewife suggestively what to buy, what foods are in season, as well as how to prepare the many varieties of dishes, all in a practical way, easily followed. Other matters of great interest to housewives are also discussed.

PRACTICAL DISCUSSIONS.

Numerous other interests are also faithfully represented in our columns, such as articles relating to common experiences of society, the question of hygiene, and an infinite variety of practical subjects. In short, the AMERICAN ANALYST also keeps abreast in giving the fullest information on all matters directly or indirectly in the line of its proper field.

SCIENTIFIC INVESTIGATIONS.

The business transacted in the office of the AMERICAN ANALYST does not by any means all come to the surface in the pages of the paper. Minute analysis of chemical compounds, careful assays of minerals, examinations of questionable oils or doubtful condiments, and the many subtle operations incident to laboratory work are constantly required of us by correspondents far and near, and the results in many cases are not publicly recorded. In this manner, the influence of the paper encompasses a vast radius, from every point of which we receive constant expressions of approval, verbally, and in more substantial shape.

ITS VALUE TO ADVERTISERS.

No person can scrutinize the advertising pages of this journal without being impressed with the uniform high character of the numerous houses who find our columns the most desirable—because the most effective—medium for advancing their interests throughout the country in the several directions to which they respectively pertain. The steady growth of our subscription lists, extending to every State in the Union, and in fact all over the world, affords another gratifying evidence of the approval given to our endeavors to sustain genuine manufactures, and to expose spurious, fraudulent, and harmful knavery.

SUBSCRIPTION \$1 PER YEAR.

Considering the amount of practical information regularly embodied in its contents, together with the fact that the subscription price for an entire year is only one dollar, we believe the day is approaching when the AMERICAN ANALYST will be regularly welcomed in every intelligent household in the land. Address,

ANALYST PUBLISHING CO.,
19 Park Place, N. Y.

CAST COPPER.—Cast copper weighs on an average 544 pounds per cubic foot.

SECRET WRITING.—A device for secret writing by means of the type-writer is mentioned by the *Paper World* as a recent invention. It requires two type-writers similarly adjusted. They are so constructed that the type can be shifted from their normal position, so that the operator, striking the key in the usual way, really writes other letters than those in his copy, forming a cipher copy. The receiver adjusts his machine in an opposite direction and writes from the cipher copy, and his machine records the letter of the original copy. The principle is very simple, says the *Mechanical News*, and it at once suggests the possibility of applying the principle of the combination lock to such a contrivance for all type-writers, so that each owner of a machine can set it to any combination, which only he and his correspondent should know. This must be feasible, and, if the new invention is of any use at all, its usefulness would be much increased by such a plan.

A NEW USE FOR LIQUID PEPTONOIDS.

Successfully used in Dissolving the False Membrane in Diphtheria.

A Physician writes: "In an experience of over thirty years I have never used anything to equal your LIQUID PEPTONOIDS as a local application with a spray. It will dissolve the membrane and destroy the diphtheretic odor in less than twenty-four hours. I use the LIQUID PEPTONOIDS full strength, as a spray, two or three times a day, in bad cases."

Used successfully by another physician in two desperate cases:—"I was induced to try LIQUID PEPTONOIDS in two very desperate cases of DIPHTHERIA. I think I never saw throats more heavily coated with exudate than were these, and I think I never saw it more rapidly disappear than in these cases, by frequent spraying with your LIQUID PEPTONOIDS."

LIQUID PEPTONOIDS can be taken by patients unable to ingest food in any other form. In *dyspepsia* and *loss of appetite* its effects are positive, its digestive properties assisting in the digestion of food taken and its peptogenic properties quickly stimulating the natural digestive secretions of the stomach.

PANCROBILIN.

Prepared (in both Liquid and Pill form) from Extract of Pancreas and Bile.

This preparation is designed expressly to increase the digestion and absorption of fats.

We believe that the fat-digesting properties of pancreatine and bile are inseparable, and that without their union in the intestinal tract but little, if any, fat would be digested and absorbed.

PANCROBILIN will be found of great service in *Phthisis* and other wasting diseases, *Nervous Prostration*, *Constipation*, *Inanition*, *Malnutrition*, *Intestinal Indigestion* and wherever there is a failure to assimilate fats.

If the skin is first wet with LIQUID PANCROBILIN, the inunction of oils will be greatly facilitated.

LIQUID PANCROBILIN is put up in pound bottles. PILL PANCROBILIN is put up in bottles holding 100 pills. The coating of the pills will resist acid digestion, when given as directed, but will be quickly dissolved in the alkaline secretions of the duodenum.

PHOSPHO-CAFFEIN COMP.

(Granular Effervescent.)

Formula for each dessertspoonful:—

Caffein.
Acidi Phosphorici aa, grains, ss.
Antipyrin.
Ext. Apii. Grav. dulc. (Celery), aa grains, j.
Sodium Bromide, grains, v.

The satisfactory results produced by PHOSPHO-CAFFEIN COMP. in *Headaches*, *Neuralgia*, *Insomnia*, *Neurasthenia* and *general Nervous Irritability*, are not due to the effect of any one ingredient, but to the happy effect of the combination. A thorough series of comparative tests have demonstrated the superiority of the above formula over any other in the market.

is the most reliable substitute known for mother's milk. Its superiority rests on the test of 30 years use in Great Britain and the U. S. A. sustaining, strengthening diet for Invalids; nutritious, easily digested, and acceptable to the most delicate stomach. Four sizes, 35c. up. Pamphlet, "Healthful Hints," sent free. **WOOLRICH & CO., Palmer, Mass.**

A VALUABLE BOOK FOR NOTHING.

The AMERICAN ANALYST will send to any person who will forward a New Subscription with One Dollar, a copy of

THE FAMILY CYCLOPÆDIA OF USEFUL KNOWLEDGE.

This is unquestionably one of the most interesting, entertaining and instructive books ever published. It is a universal educator for every member of the family circle, filled with useful information from beginning to end, and this information is given in such an attractive and pleasing way that the book is quite as entertaining as it is instructive. It treats of hundreds of subjects of which no man, woman or child who seeks to be well informed can afford to be ignorant, yet of which the masses of people are entirely unlearned. It contains the cream or substance of a dozen ordinary volumes, and is one of the most valuable and useful books a family can have in the house. No living man is so well informed that he may not learn from it. It is a book for the masses, for old and young, rich and poor, and will be read with pleasure and profit by all. It will likewise be found of great value as a work of reference. The book is profusely and elegantly illustrated, and is conveniently divided into departments, as follows: **Biography, History, Natural History, Travels, Manners and Customs, Etc.; The World Illustrated, Useful Arts and Manufactures, Trees, Plants, Fruits, Etc.; Great Inventions, Mining, Wonders of the Sea, Familiar Science, Law for the Masses, Statistical and Miscellaneous.** All the above subjects are fully and ably treated in this valuable book. It is a vast storehouse of useful and entertaining knowledge—unquestionably one of the best and most valuable books ever published in any land or language. No cyclopædia ever heretofore published at twice the cost is to be compared with this book in point of artistic make-up, beauty, and excellence of illustration, and quality of contents. As a holiday or birthday present for any one, nothing more appropriate or acceptable could possibly be selected. **THE FAMILY CYCLOPÆDIA OF USEFUL KNOWLEDGE** is a large and handsome book of 544 pages, 12mo, printed upon fine paper and elegantly bound in cloth, embellished with artistic designs in black and gold. It contains **Two Hundred and Seventy-three Beautiful Illustrations**, the original cost of which was over \$5,000. The book will be sent by mail, post-paid, to any person sending a **New Subscription with One Dollar**. It is as large and handsomely gotten up as books usually sold at \$1.50 and \$2.00, and in the quality of its contents is worth a dozen ordinary volumes.

ADDRESS ANALYST PUBLISHING CO.,
—19 PARK PLACE, NEW YORK.—

Tabasco Pepper Sauce

OR LIQUID PEPPER.

Is simply the Pulp of the Ripe Pepper Extracted by Pressure.

The seed of this Pepper was obtained from Central America, and by careful cultivation in Louisiana for many years has been so improved in strength, flavor and aroma, as to have become a new variety of Red Pepper, superior to all others. The pulp is so handled as to retain all the flavor, strength, aroma and color of the ripe fruit, and to keep unimpaired in any climate. It excites the appetite, promotes digestion, and is pronounced, by connoisseurs, to be the finest condiment in the world. For medicinal purposes it recommends itself by its purity, strength and diffusible form.

Manufactured by E. McILHENNY,
NEW IBERIA, LA.

For Sale by all Wholesale Grocers.

NATRONA BI-CARBONATE OF SODA.

ABSOLUTELY PURE.

The nature of the raw material from which NATRONA BI-CARBONATE OF SODA is made—viz., kryolith, a mineral containing *pure sodium*—insures a purity and uniformity of product which cannot be obtained from any other known material. In making BI-CARB. SODA from any other raw material, the use of sulphuric acid is a necessity, but none is used in any part of the process of making NATRONA BI-CARB.; hence its entire freedom from the slightest trace of arsenic, which is always present in ordinary soda. Its absolute purity and entire freedom from all traces of *sulphate of soda*, common salt and other impurities, render NATRONA BI-CARB. NEARLY TASTELESS, and being bolted through the finest bolting-cloth, insures the finest stage of division.

To these indisputable facts the attention of CONSUMERS of soda is specially called. They are IMPORTANT, and should influence both those who use and those who sell soda, to buy and sell NONE BUT THE BEST.

The NATRONA BI-CARB. Soda is kept in stock by almost every wholesale druggist and grocer throughout the United States, of whom it may be ordered.

Natrona Bi-Carb. Soda is unequalled by any other brand of English or American Manufacture.

DEAN'S PATENT

ARDENTER MUSTARD.

BEST IN THE WORLD.

Ardenter Mustard Pellets

— FOR —

Dyspepsia and Indigestion.

UNIVERSALLY recommended and prescribed by physicians. The medicinal property are English mustard seed coated with pepsin and sugar. You will find it will relieve you after using two or three doses. It is very beneficial for Heartburn, Sour Stomach and Headache. They are a beautiful confection for children. Each bottle contains full directions.

W. G. DEAN & SON,

361 and 363 Washington Street, 84, 86 and 88
North Moore Street, New York.

FAC SIMILE OF THE LABEL OF

THE BEST SCOURING AND CLEANING SOAP
IN THE WORLD.

Costs as much to manufacture as Sapolio, yet sells at about half the price (\$2.75 per box of 72 cakes). Can be retailed for as much with equal or better value to the consumer, although it is generally sold at 5 cents a cake. Cut this out and ask your Jobber to send you a box of *Pride of the Kitchen*. It is worth trying.

Its superior excellence proven in millions of homes for more than a quarter of a century. It is used by the United States Government. Endorsed by the heads of the Great Universities as the Strongest, Purest, and most Healthful. Dr. Price's Cream Baking Powder does not contain Ammonia, Lime or Alum. Sold only in cans.
PRICE BAKING POWDER CO.
NEW YORK. CHICAGO, ST. LOUIS.

COLDEN'S LIQUID BEEF TONIC.

AN INVALUABLE AID IN THE TREATMENT OF ALL CASES OF DEBILITY.

Established 15 Years. Endorsed by Scores of Physicians.
Essentially Different from all other Beef Tonics.
Beware of Imitations.

COLDEN'S LIQUID BEEF TONIC consists of the Extract of Beef (by Baron Liebig's process), spirit rendered non-injurious to the most delicate stomach by extraction of Fusel Oil, soluble Citrate of Iron, Cinchona, Gentian and simple aromatics. An official analysis of this preparation by the eminent chemist ARTHUR HILL HASSALL, M. D., F. R. S., and an endorsement by SIR ERASMUS WILSON, F. R. S., is printed on the label of each bottle.

Its Range of Action Embraces all Cases of Debility.

By the urgent request of several eminent members of the medical profession, I have added to each wineglassful of this preparation two grains of SOLUBLE CITRATE OF IRON, an which is designated on the label as "No. 1," while the same preparation, without Iron, is designated on the label as "No. 2." It acts directly on the sentient gastric nerves, stimulating the follicles to secretion and gives to weakened individuals that first pre-requisite to an improvement, an appetite.

I will, upon application, send a sample bottle of Colden's Liquid Beef Tonic to any physician in regular standing. Please ask your Dispensing Druggist (if he has not already supplied) to order it. In prescribing this preparation physicians should be particular to mention "COLDEN'S" viz: "EXT. CARNIS. FL. COMP. (COLDEN)." It is put up in pint bottles and can be had of Wholesale and Retail Druggists generally throughout the United States.

CLAIRVOYANT MALPRACTICE.

A recent action at law, in which a so-called clairvoyant physician was the defendant, possesses special interest from the circumstance that it is the first case of the kind that has reached adjudication in the courts. The parties reside in Wisconsin, and the plaintiff brought suit for malpractice for the improper treatment of his son. The testimony showed that the clairvoyant's treatment consisted in going voluntarily into an alleged trance condition, and while in such condition, giving a diagnosis of the case and a prescription for the ailment. He did not make any personal examination, and did not endeavor to ascertain the past or present condition of the patient; and, indeed, he did not profess to have been educated in the science of medicine. The answer to the charge was that the clairvoyant employed the usual methods of his class, and could not, therefore, be liable for malpractice, as it was understood how he treated his

patients. The judge was asked to charge the jury as follows: "If the defendant was a clairvoyant physician, and professed and held himself out to be such, and the plaintiff and his parents knew it, and at the time he was called to treat the plaintiff both parties understood and expected that he would treat him according to the approved practice of clairvoyant physicians, and he did so treat him, and in strict accordance with the clairvoyant system of practice, and with the ordinary skill and knowledge of that system, then the plaintiff cannot recover, and your verdict must be for the defendant." The judge declined to make such a charge, but was willing to direct the jury by making the last clause read, "with the ordinary skill and knowledge of physicians in good standing, practising in that vicinity, then the plaintiff cannot recover, and your verdict must be for the defendant." This ruling was not satisfactory to the clairvoyant, but was affirmed on appeal, as was also the verdict adverse to him. The court held that it was not good law for any person to claim immunity against a charge of malpractice simply because he practiced a peculiar kind of medicine. The physician must have reasonable knowledge of his profession and have ordinary skill. If a person goes into a trance, and then prescribes without any personal examination of the patient, he does so at his own risk. This view will be regarded as eminently sound by the great mass of the community who do not practice medicine but are practiced upon.

FRENCH "VIN ORDINAIRE."

"I know ———'s wines are good, for they are genuinely imported. I'm sure of that, for I have seen the invoices and the custom house marks on the packages." There are simple-minded persons, generally of the sort who say "doncherno," and pronounce can't "cawnt," who are capable of saying that sort of thing. In fact, it is a common argument among the idiots who consider it "bad form" to approve of anything American for which they may be able to find an imported substitute. They revile American wines simply because they are American, and envy the French for their possession of wines which must necessarily be pure and excellent because they are French. The following little story, recently brought to light by proceedings in a French court, will possibly be something of a shock to those pretentious and unpatriotic fools, but may serve as a suggestive warning to sensible but indifferent persons who might, without such a revelation, fancy that the vaunters of imported wines had some intelligent reason for their loudly expressed preference. A farmer in Normandy, seeing a wine advertised by a firm in Bordeaux, wrote for a couple of casks of it, and forwarded the money. A fortnight afterwards it arrived at the station, and he sent his carter to bring it home. The carter brought two casks, but, to the farmer's astonishment, only one cask was full; the other was empty. An examination of the cask showed that it had not been tampered with, and there was no trace of leakage. Evidently an empty cask had been

sent by mistake. The farmer at once wrote to the Bordeaux wine merchant, complaining of the carelessness. In due course of time he received the following reply: "Dear Sir: I am sorry for the mistake made by my man, but you can easily rectify it. If you will fill the empty cask with water and leave it for a fortnight, you will find the wine all right. The ingredients are at the bottom of the cask, but my man foolishly omitted to add the water. Waiting your further orders, I am, sir, yours, etc." The "further orders" he got were to appear in court and show cause why he should not refund to the farmer the price of the two casks of "falsified" wine. The case has not yet reached a determination. How much of that sort of French "vin ordinaire" is served at restaurant tables in New York?

ICE PROSPECTS FOR THE SUMMER.

Carefully prepared reports of the ice crop and of the quantities stored show that there need be no fears of a famine. But the visible supply is, in consequence of the scant yield, comparatively small, as a rule, and the quality in many cases is inferior, so higher prices are apparently unavoidable. In this part of the country the advance on last year's scale is from twenty-five to thirty-three per cent. The conditions vary greatly throughout the country, there being reported some highly-favored spots (looking at them with the summer in mind), and others where the outlook is not comforting. The estimate is that there is enough to go around with rigid economy, but that some of it will have to be carried around from these places where there is enough and to spare to those places where there is small store. There is some talk of importations from Norway, and much hope that the summer will be cool. Nothing is said about resorting to artificial congelation. Some years ago the story ran that ice had been produced in several Southern cities by various evaporating processes at less than the cost of importation from the North; but that may have been only a part of the advertisement of a patent.

WESTERN TIMBER.

The *Timberman* does not seem alarmed at the prospect of an early destruction of our timber supply. It asserts that Puget Sound has 1,800 miles of shore line, and all along this line, miles and miles farther than the eye can reach, is one vast and almost unbroken forest of enormous trees. The forests are so vast that, although the sawmills have been ripping 500,000,000 feet of lumber out of them every year for the past ten years, the spaces made by those inroads seem no more than garden patches. An official estimate places the amount of standing timber in that area at 500,000,000,000 feet, or a thousand years' supply, even at the enormous rate the timber is now being felled and sawed. The editor adds that the timber belt of Washington Territory covers an area equal to that of the States of Vermont, Massachusetts, Connecticut and New Hampshire.

For use at the Soda Fountain and in all Pharmaceutical preparations requiring chemically pure syrup. Warranted to keep in any climate. Order of Wholesale Druggists, Grocers, Confectioners, or of

DRYDEN & PALMER,
19 Hudson St., New York.

PROGRESSIVE LEGISLATION.

The Michigan Legislature has shown itself, in two recent instances, in full accord with the higher tendencies of the period. On May 7th the Senate passed a bill prohibiting the sale of tobacco in any form to minors under 17 years of age, without a written order from their parents or guardians. On the 9th inst. the same body made short work of the House-meat Inspection bill, by a vote of 19 to 10. When the vote was announced, it was reconsidered and indefinitely postponed for the purpose of killing the bill beyond any hope of recall. The same programme was carried out with Senator Colgrove's bill, which was identical with the House measure. This puts an end to the hope of any inspection legislation at the hands of the present Legislature. Good for Michigan. The schemers have been foiled in nearly every instance.

INSISTING ON GOOD, CHEAP BEEF.

On the final day of its sitting, May 15th, the Assembly of New York State rejected the Beef Inspection bill by a vote of 80 to 28. This action of the New York Legislature had been forecast in these columns. The ground of the project's repudiation was its manifest unconstitutionality. It was a thinly-disguised attempt to discriminate against Western meat in Eastern markets, and was as clearly in violation of constitutional provisions as it was opposed to public interests. The vote is emphatic enough to show that this form of pernicious and inexcusable legislation is not in favor; but the fact that it secured serious consideration and support emphasizes the necessity of resisting the tendency toward such abuses of legislative power.

TO TEST THE LAW.

Manufacturers of adulterated and acid vinegar propose to test the constitutionality of the law prohibiting the sale, in Ohio, of all but pure cider vinegar. The decision of the Supreme Court will be looked for with considerable interest, as the decision will necessarily affect all acts for the suppression of the manufacture of adulterated food.

TELESCOPES.—Of the world's refraction telescopes, nine have apertures exceeding 20 inches, viz.: Lick Observatory, California, 36 inches; Pulka, Russia, 30; Yale College, 28; Littrow, Vienna, 27; University of Virginia, 26; Washington Naval Observatory, 26; Gateshead, England, 25; Princeton, New Jersey, 23; and Buckingham Palace, London, England, 21. Six of these instruments are the work of an American firm.

FILTERING DRINKING WATER.

THE INADEQUACY OF THE AVERAGE FILTER TO PURIFY THE LIQUID.

(Continued from page 231.)

With the imperfection of all other methods, we have in prolonged boiling a sure disinfectant of any water. I have usually found that maintaining a water at the boiling point for even less than fifteen minutes sufficed to prevent any of its germs from developing in gelatine, and this even with bad waters from sewage-infected rivers. The process of distillation likewise sterilizes water. That freezing temperatures destroy only a certain proportion of the bacteria which exist in the water from which the ice we use is formed, must, I think, be evident to those who have read Dr. Prudden's masterly paper on this subject. He there shows that the typhoid bacillus in ice retained its vitality for one hundred and three days. I shall simply echo his previous warning against putting ordinary ice into water which we are to drink, as many kinds of bacteria may be thereby introduced. The mechanical separation of impurities is the principal action in all filters, whatever their composition. The amount of oxidation produced by the passage of considerable quantities of water through inconsiderable masses of charcoal, sand, or anything else, seems never sufficient to chemically purify an infected water, although the Berlin system of filtration, by large beds of sand skilfully managed, effects a notable improvement in this respect. Almost all tissues tend to separate visible particles from water which is turbid, or in which a deposit settles. The fact that such matter is retained from the water passed through filters appeals very strongly to most persons; and the general assumption that such visible matter is dangerous, and that its removal insures the purification of water, seems to explain the extensive use of filters. They are all composed of felt-like matter (filtrum), or of any tissue or substance so woven, composed, or arranged by its structure to more or less completely arrest the passage of sediment and the floating particles existing in varying amounts in nearly all natural waters. The filter in domestic use may be ranged in two classes. In one class the water runs or is poured into a tank or other receiver over or beside some filtering medium, through which the flow is into a receptacle, and from this the water is taken as needed, or is stored, as fit for drinking. Those of the second variety are designed to connect with the faucets, and to strain from the water such impurities as it brings through the hydrant.

One of the most widely used varieties is this simple and portable one, which renders water clearer and more agreeable to the eye. It is composed of a cylinder of pressed carbon, three inches or less in diameter, and having nearly the same depth, which has from its interior a tube passing through the bottom of the funnel in which it rests, and thus requiring all the water passing out of the bottom of the funnel first to go through the mass of carbon. The flow is very sluggish unless use be made of pressure or suction, as, for example, by lengthening the tube taking water out of the filter, which impairs the effectiveness of this so far as purification of the water is concerned. After this has been used for a few days the retardation is very marked, and is due to the clogging of the filter by the various matters which form the sediment of the unfiltered water. This necessitates frequent cleansing. Taking a freshly sterilized carbon filter of this sort and pouring into the funnel Croton water just drawn after considerable has run from the faucet, and then collecting in sterilized test-tubes the first flow from the filter, adding of this (as already explained) one cubic centimetre to ten parts of softened nutrient gelatine, the mingled gelatine and water being poured upon a cool plate, it is seen that, before three days have passed, several colonies have developed. Comparing the number of these with that found from the original Croton water plated just after being drawn, we find at least from five to eight per

cent. of the bacteria pass through the filter and develop. The percentage rises as more and more water flows through. From fourteen trials made with simple Croton water, I found that through a carbon filter, freshly sterilized and the introduction of germs from the air and other sources of contamination being guarded against, the first flow showed only a small percentage of the bacteria found in the original water used. Then I continued the use of the same filter without re-sterilizing, and endeavored in every way to have the conditions under which it was tested as much as possible like those which would exist in domestic use, and the supply of water in the funnel was allowed to become exhausted at times, as usually during the night. In this filter thus used, the number of bacteria in the water passing through is, on the second day and thereafter, much larger than in the water taken after being poured into the funnel and before it has percolated through the carbon block. This excess, when large, seems to bear an inverse ratio to the volume of the flow. It is a familiar fact that, if fresh hydrant water in a flask covered with cotton (to prevent the entrance of bacteria from the air) be allowed to stand for a day at the temperature laboratory, the original bacteria in the water may be found to have increased considerably. So, as a collateral test, after water had been poured into the filter and before it has passed through the carbon, I have taken some of this original water and allowed it to stand in test-tubes and flasks, both stoppered and open, by the side of the filter similarly protected from the entrance of germs from the air, and exposed to the same variations of temperature. This water, examined at the same time as that coming out of the filter, showed that the bacteria appear to multiply much more rapidly in the substance of the filter than outside in separate flasks, likewise kept at the varying temperature of the laboratory, as it then was. The water poured in rarely contained as many as 225 bacteria in each c. c., and yet in from one to three days from the time when the freshly sterilized filter had begun to be used, the water after passing through the carbon showed several thousand in every case, and at times more than 25,000 bacteria in each c. c. All sorts of bacteria appeared to pass through, and not alone water species. The bacillus of typhoid fever will not only pass through, but in two of my trials I found that it had increased. For such special tests I used sterilized Croton water, into which bacteria were introduced from pure cultures. For artificial typhoid-water the bacillus or typhoid was added from agar and potato cultures. Harmful bacteria can pass through such filters, can possibly increase in them under certain favoring conditions, and from parallel tests seem to retain their vitality longer when in the substance of the filter than when in a glass vessel beside it. Clean sand fairly represents the granular masses of filtering material, and has all the advantages of powdered charcoal and magnesia as generally used for filtering considerable quantities of water, while it is more readily cleansed of the accumulated organic matter and, unlike spongy iron, adds nothing objectionable. Unless, as is the case of the large Berlin filters and others acting similarly, rendered more effective by overlying silt and organic matter, beds of sand do not prevent the passage of large numbers of bacteria. I have found many bacteria in waters from various artesian wells coming from a deep stratum of sand. Through a thin sterilized layer, from six inches to one foot in depth, of the finest sand procurable from beaches, all the way from forty per cent. to ninety-five per cent. of the bacteria in the original water pass, even when the level of the water is never more than three inches above the surface of the filtering mass. When a higher pressure is afforded by the water, very few of the bacteria are kept back. As in nearly all other filters, so through a layer of sand all kinds of bacteria, harmless or harmful, appear to pass easily. Here, too, they can multiply in the moist sand. Thus, I have found the hydrant water, which entered the sand filter with 290 bacteria in each c. c., to come out through the filter

(not freshly sterilized before using) with sixty and one hundred times as many as entered. In a gramme of sand taken from a filtering bed I have found more than 10,000 bacteria.

The combination of other substances with sand, as in numerous small and large filters, fails to improve the usefulness of either, except in so far as the elimination of sedimental and other coarser particles is concerned. Sponge is often employed for this purpose, as well as independently, yet it is incapable of separating bacteria from the water strained through it simply, or through sand or other substances used with it. When a large mass of fine, sterilized sponge is closely packed, the first few ounces of hydrant water that pass through may have a very small percentage of bacteria, but the proportion soon increases, while if the sponge-mass be considerable and loosely packed it may, even in the beginning and under exceedingly slight pressure of water, keep back no more than fifteen per cent. of the bacteria of the original water. This freshly sterilized sponge can at the end of the first day of ordinary use cause the water then flowing through it to contain from increase ten times as many bacteria as the Croton water poured in. The stronger the pressure, and the more rapid the flow, the lower is the ratio of excess due to increase in the filter over the quantity found in the unfiltered supply, which of course, was here, as in all other tests, regularly plated at the same time with the filtered water. When the flow is sluggish, and when it stops entirely at times because of all the water supplied having passed through, the sponge substance favors the increase of the bacteria to a greater extent than is the case with sand. The sponge, within twenty-four hours after sterilization may, under these conditions, cause the water first running through after the intermitting of the flow to have five hundred times as many bacteria in each cubic centimetre as are found in the water supplied for filtration. The only way to cleanse such a filter is to remove the sponge and boil it. Then the process repeats itself. In a few hours after unsterilized water moistens it, the mass of sponge is again teeming with bacteria. Sponge filters are, so far as I have seen, becoming less popular. It is easily recognized, even by an untrained observer, that the organic matter in sponge can undergo decomposition under the conditions obtaining in ordinary filters. Several of the large filter systems used in manufactories, hotels, and other places where large amounts of strained water are used, employ sponge, and the filtered water abounds in bacteria. Filter paper, as used in laboratories, is useful in separating precipitates and sedimental particles from water, but at least from fifty to seventy per cent. of the bacteria in Croton hydrant water go through with the water filtered, even if the pressure be exceedingly slight. The paper which I employed in the trials was, of course, carefully selected, and the folding was cautiously done, so as to prevent any break in the substance. Only single sheets were tested. "Prepared cotton," cleansed as for surgical dressings, and so made absorbent, removes considerably fewer of the impurities of the water than does the filter paper. Two-thirds of the bacteria pass through when the cotton is at its best, freshly sterilized and carefully packed. If enough be used, it will usually render the water clear; but, as it has been lauded as a filter, I ought to add the statement of my observation that, when left moistened with water, as in the intervals of filtering through it, the bacteria of the original water can multiply over one hundred and fifty times, and all kinds can pass through it. Combinations of the various substances mentioned have hardly any enhanced merit as strainers, and, as far as the bacteria are concerned, the combination seems to add no safeguard. Sand with carbon (bone charcoal) and sponge or cotton, hold back at first a larger percentage than sand would, by itself. Yet bacteria pass through in any case, and the increase afterward is greater than in simple sand. This I have seen in various filters.

In a well-known bottling establishment of New York, where immense quantities of artificial waters are pre-

pared every week, all the water used in their preparation flows through a layer of fine sand in the bottom of an enormous vat and, from the receptacle into which it then flows, it passes through a layer of charcoal. These layers are each less than a foot in thickness, and water passes rapidly through. The sediment is thereby removed, but in the single examination which I was enabled to make I found that each cubic centimetre of the filtered water had over 3200 bacteria on each of the two plates made, while the Croton taken from the hydrant in the immediate neighborhood on the day before averaged a few over one-eighth as many. Asbestos of the best quality, new, freshly sterilized and tightly packed, I have found capable of holding back all bacteria when the pressure of the water was low, and the few that were forced through when the substance was defective did not seem to multiply so rapidly as the other filter masses. While it, when of the best finish and most tightly compressed, deserves to rank next to the principle employed in porcelain filters, these latter are superior in that they can be regularly furnished of a uniform and definite quality which produces the best results, while I have found it difficult to keep the best asbestos boards up to their original standard of excellence, and if the surface be large enough to insure an abundant flow of water, flaws are liable to arise, and these let various bacteria through. With asbestos it is the fineness of the surface which the original water encounters that is important more than the thickness of the layer.

Although wire cloth strains out the coarsest particles, its structure does not cause the removal of any of the bacteria from water passing through. Still it has the positive merit of being easily cleaned, and can be heated in an oven or boiled to sterilize it. Furthermore, it does not furnish a filter-mass for the bacteria to multiply in, although harmful bacteria can adhere to it and become dangerous if it be left uncleared. Closely woven cloth, such as thick, dense flannel, when only a slight pressure is exerted by the water, may stop ten per cent. of the bacteria in the water poured upon it. It is easily cleansed and, if very often changed, and boiled before using, it serves excellently as a simple strainer without the disadvantage, in this respect, of ordinary filters, in whose substance the increase of bacteria may be enormous.

Like porcelain, filters of porous stone, if of the best quality, prevent the passage of bacteria with the water filtered through them just after they have been sterilized. To test porous stone I employed selected perfect specimens of a popular filter which very satisfactorily clears all turbidity from as bad a water as that of the Hudson River at its worst. In these, the stone layer was cemented into a porcelain cylinder and was about three-eighths of an inch in thickness. The pressure was never more than that of ten or eleven inches of water, and, at the fastest, less than three-fourths of a litre passed through in an hour. As the sediment of the water settled upon the surface of the stone, the flow became much slower. During twenty-six trials of this kind of filter, it had previously been sterilized ten times by exposure to moist or dry heat, or to both, for several hours. In every one of these ten cases the various waters poured into the receptacle above the porous stone for the first time after sterilization, flowed through germ-free; that is, the stone was permeable for water, but at first allowed no bacteria to pass through, and the plates of gelatine developed not a single colony from the usual cubic centimetre of the filtered water. After some hours of use, a few bacteria had insinuated themselves into the stone or were drawn through with the water. Within twenty-four hours the water flowing through and collected in sterilized receptacles contained many bacteria, which numbered regularly from seven to fourteen times as many as were in the original hydrant water supplied during these trials. After several days, the number of bacteria had so multiplied in the stone, that the first water running through after the stone had remained for several hours without any flow through it (as happens constantly over-night in

domestic use), showed in each cubic centimetre of this filtered water over one hundred times as many as the average water poured in for filtration. To test further these filters, I have used artificial waters made by adding bacteria of all shapes and characters, from pure cultures to Croton water sterilized by boiling. These various kinds can get through, but the disease-producing and spiral forms usually died out in large numbers before any could pass. From Croton water, the most marked by its predominance in the filtered product was a short, mobile bacillus which was unlike the two varieties first forced through the porcelain in my experiments.
